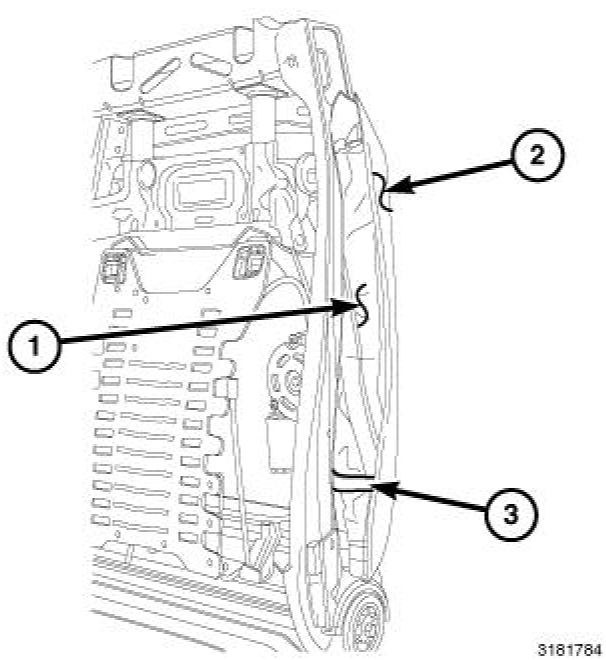
Seat AirBags (SAB) (1) (also known as pelvic and thoracic airbags) are standard equipment on this model. Vehicles with this equipment can be readily identified by a sewn tag with the **SRS - AIRBAG** logo located on the outboard side of the front seat back trim cover. These airbags are completely concealed beneath the seat back trim cover on the upper outboard sides of both front seat backs. Each SAB is inserted into a molded thermoplastic chute called an intensifier on the outside of the seat back frame, then secured to the frame by nuts on two studs (2) on the SAB bracket on the inboard side of the inflator. The SAB is connected to the vehicle electrical system through a dedicated jumper wire harness with a connector insulator that connects directly to the inflator initiator (3). The connector insulators are uniquely keyed and color-coded to ensure they can only be connected to the initiator.



[Fig. 22: Folded SAB Cushion, Chute & Fabric Strap]
Courtesy of CHRYSLER GROUP, LLC

The folded SAB cushion (1) is contained within and protected by the chute (2). The cushion is constructed of a

coated nylon fabric. The folded SAB cushion is tied to the airbag inflator with a fabric strap (3). The inflator consists of the airbag initiator and a high pressure cylinder filled with inert gas. The airbag inflator is a single-initiator, hybrid-type unit that is secured to the SAB bracket.

The SAB cannot be repaired, and must be replaced if deployed, ineffective, or in any way damaged. If the SAB is deployed the thermoplastic chute, the seat back frame, the seat back foam, the seat back trim cover and the SAB jumper wire harness must also be replaced.

OPERATION

OPERATION

Each Seat AirBag (SAB) (also known as a pelvic and thoracic airbag) is deployed individually by an electrical signal generated by the Occupant Restraint Controller (ORC) to which it is connected through left or right SAB line 1 and line 2 (or squib) circuits. The hybrid-type inflator assembly for each SAB contains a small canister of highly compressed inert gas. When the ORC sends the proper electrical signal to the inflator, the electrical energy creates enough heat to ignite chemical pellets within the inflator.

Once ignited, these chemicals burn rapidly and produce the pressure necessary to rupture a containment disk in the inert gas canister. The inflator and inert gas canister are sealed and connected so that all of the released gas is directed into the folded SAB cushion, causing the cushion to inflate. As the cushion inflates it will split the fabric retainer strap and the thermoplastic chute (intensifier) will direct the expanding cushion through the outboard side of the seat back trim cover and into the area between the outboard side of the front seat and the front door to protect the front seat occupant during a side impact collision.

Following the deployment, the SAB cushion slowly deflates by venting the inert gas through the loose weave of the cushion fabric, and the deflated cushion hangs down loosely from the outboard side of the front seat back.

The ORC monitors the condition of the seat airbags through circuit resistance. If any fault is detected the ORC will illuminate the airbag indicator in the instrument cluster and store a Diagnostic Trouble Code (DTC). Proper diagnosis of the SAB inflator and squib circuits requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate Diagnostic & Testing article.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these

deposits may cause irritation to the skin and eyes.

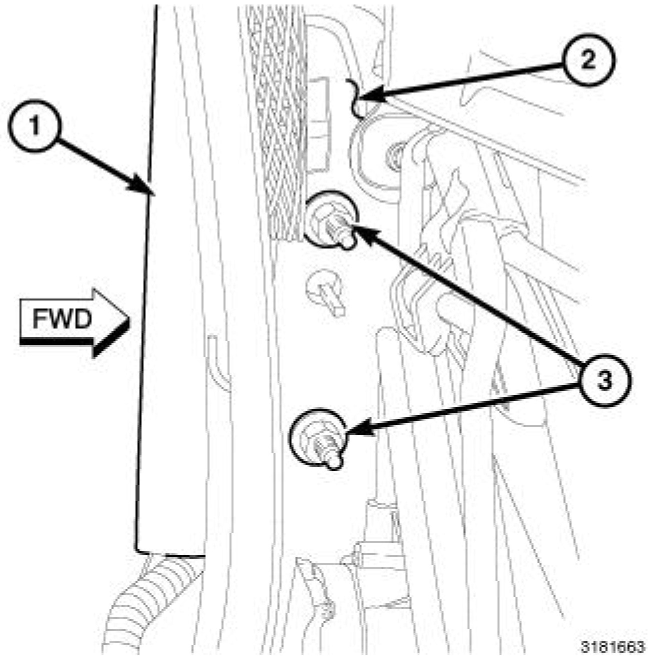


Fig. 23: Front Seat Back Frame, Two Nuts & Seat AirBag (SAB) And Thermoplastic Chute
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The following procedure is for replacement of an ineffective or damaged Seat AirBag (SAB). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the SAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to STANDARD PROCEDURE.**

1. Position the front seat to its most forward position for easiest access to the front seat mounting hardware.
2. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
3. Remove the front seat from the vehicle. Refer to **SEAT, FRONT, REMOVAL** .
4. Remove the trim from the front and back of the front seat back frame (2). Refer to **COVER, SEAT BACK, FRONT, REMOVAL** .
5. Remove the two nuts (3) that secure the Seat AirBag (SAB) and thermoplastic chute (intensifier) (1) to the outboard side of the seat back frame.

CAUTION: **Do not pull on the Seat AirBag (SAB) jumper wire harness take out or pry on the connector insulator to disengage the connector from the SAB inflator connector receptacle. Improper removal of this take out and its connector insulator can result in damage to the airbag circuits or the connector insulator.**

6. Disengage the two SAB studs from the seat back frame and remove the SAB and chute from the seat back

as a unit.

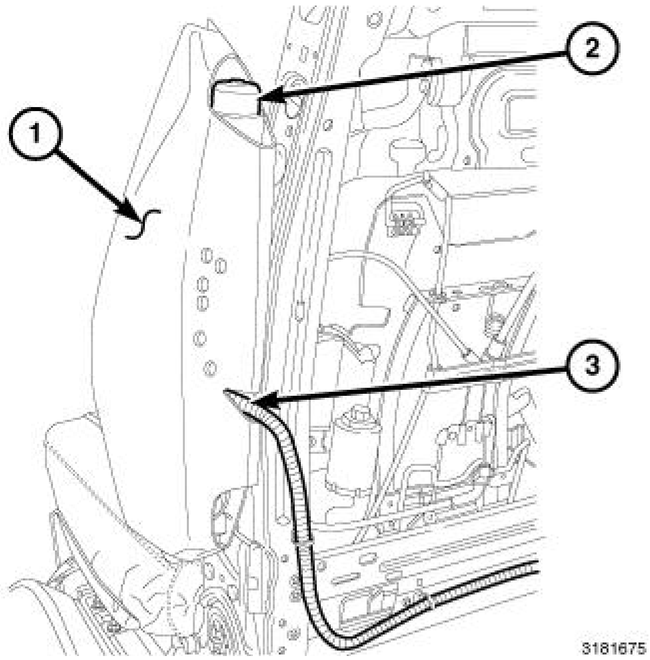

Fig. 24: Chute, SAB Jumper Wire Harness & SAB Inflator
Courtesy of CHRYSLER GROUP, LLC

7. Disengage the SAB from the chute (1) to access and disconnect the SAB jumper wire harness (3) connector from the base of the SAB inflator (2). Pull the connector insulator straight out from the inflator to disconnect it from the connector receptacle.
8. Disengage the SAB jumper wire harness from the opening in the back of the chute.

INSTALLATION

INSTALLATION

WARNING:	**To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

CAUTION:	**The Seat AirBag (SAB) must be installed into the nylon pouch integral to the front seat back trim cover before the SAB or the trim cover are installed on the front seat back frame. Failure to do so will adversely affect the function of the SAB system.**

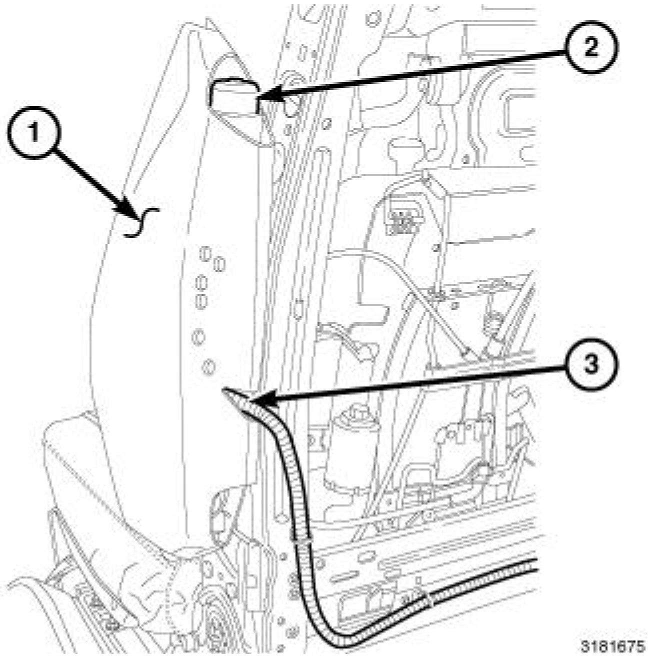

Fig. 25: Chute, SAB Jumper Wire Harness & SAB Inflator
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The following procedure is for replacement of an ineffective or damaged Seat AirBag (SAB). If the SAB is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the SAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to STANDARD PROCEDURE.**

1. Engage the SAB jumper wire harness (3) through the opening in the back of the thermoplastic chute (1).
2. Reconnect the seat jumper wire harness connector to the connector receptacle at the base of the SAB inflator. Be certain that the connector latches and lock are fully engaged.
3. Carefully slide the Seat AirBag (SAB) and inflator (2) into the chute and engage the two SAB studs through the holes provided in the chute. Be certain not to tear or damage the chute.

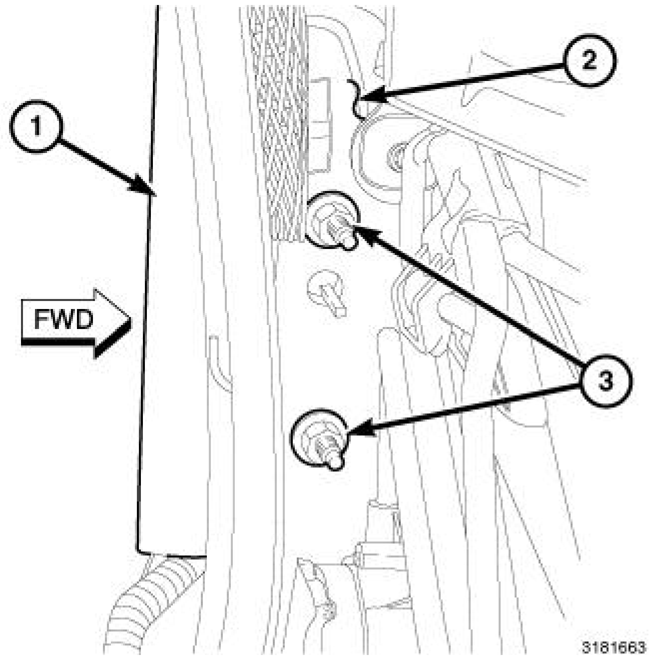

Fig. 26: Front Seat Back Frame, Two Nuts & Seat AirBag (SAB) And Thermoplastic Chute
Courtesy of CHRYSLER GROUP, LLC

4. Position the SAB and chute (1) as a unit to the outboard side of the seat back frame (2) and insert the SAB mounting studs through the mounting holes in the frame.
5. Install and tighten the two nuts (3) that secure the SAB to the outboard side of the seat back frame. Tighten the nuts to **SPECIFICATIONS**.

CAUTION: Be certain that all of the trim is properly reinstalled on the front seat back frame. Failure to do so will adversely affect the function of the Seat AirBag (SAB) system.

6. Reinstall the trim onto the front and back of the front seat back frame. Refer to **COVER, SEAT BACK, FRONT, INSTALLATION** .
7. Reinstall the front seat into the vehicle. Refer to **SEAT, FRONT, INSTALLATION** .
8. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

AIR BAG, SIDE CURTAIN

DESCRIPTION

DESCRIPTION

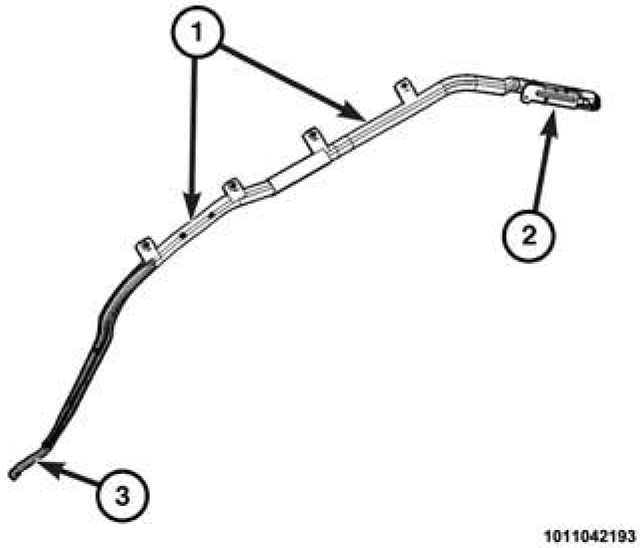

Fig. 27: Side Curtain Airbags, Bracket & Tether
Courtesy of CHRYSLER GROUP, LLC

Side curtain airbags (1) (also known as Side AirBag Inflatable Curtains/SABIC) are standard factory-installed equipment for this vehicle. These airbags are passive, inflatable, Supplemental Restraint System (SRS) components. The side curtain airbag system is designed to reduce injuries to the vehicle occupants in the event of a side impact collision or a vehicle rollover incident. Each side curtain airbag cushion provides full coverage of the side glass on the same side of the vehicle as the monitored impact.

Each vehicle is equipped with two individually controlled side curtain airbag units. These side curtain airbag units are concealed and mounted above the headliner where they are each secured to one of the inner roof side rails. Each folded airbag cushion is contained within a fabric wrap and suspended from plastic clamp hangers that are spaced along the inner roof rail from the A-pillar at the front of the vehicle to the C-pillar at the rear of the vehicle. A screw secures each of the clamp hangers to a weld nut in the inner roof rail.

A tether (3) extends down the A-pillar from the front of the side curtain airbag cushion. A stamped T-tab retainer at the end of the tether is secured to a slot in the sheet metal. A screw secures the tether retainer to a weld nut in the A-pillar.

The stamped metal airbag inflator bracket (2) at the rear of each SABIC unit is hung by two hooks from slots in the inner C-pillar, then secured by a screw to a weld nut in the inner C-pillar. The inflator initiator is connected to the vehicle electrical system through a dedicated take out and connector of the body wire harness at the rear of the inflator. The body wire harness connects the side curtain airbag unit to the Occupant Restraint Controller (ORC).

The side curtain airbag units cannot be adjusted or repaired and must be replaced if deployed, ineffective or in any way damaged. Once a side curtain airbag has been deployed, the complete side curtain airbag unit, the support bracket, the headliner, the A-pillar trim, the upper quarter panel trim, the C-pillar trim as well as all other visibly damaged components must be replaced.

OPERATION

OPERATION

Each side curtain airbag (also known as Side AirBag Inflatable Curtain/SABIC) is deployed individually by an electrical signal generated by the Occupant Restraint Controller (ORC) to which it is connected through the left or right SABIC line 1 and line 2 (or squib) circuits. The hybrid-type inflator assembly for each airbag contains a small canister of highly compressed inert gas. When the ORC sends the proper electrical signal to the airbag inflator, the electrical energy creates enough heat to ignite chemical pellets within the inflator.

Once ignited, these chemicals burn rapidly and produce the pressure necessary to rupture a containment disk in the inert gas canister. The inflator and inert gas canister are sealed and connected to a tubular manifold so that all of the released gas is directed into the folded airbag cushion, causing the cushion to inflate. As the cushion inflates it will drop down from the roof rail between the edge of the headliner and the side glass/body pillars to form a curtain-like cushion to protect the vehicle occupants during a side impact collision or a vehicle rollover incident. The cushion features large chambers that inflate adjacent to the head of each front and rear seat occupant.

The front tether keeps the side curtain airbag cushion taut to the side of the vehicle. In addition, ramps integral to the side trim of the interior guide the cushion into the proper deployment position. Following the deployment, the cushion slowly deflates by venting the inert gas through the loose weave of the cushion fabric and the deflated cushion hangs down loosely from the roof rail.

The ORC monitors the condition of the side curtain airbags through circuit resistance. If any fault is detected the ORC will illuminate the airbag indicator in the instrument cluster and store a Diagnostic Trouble Code (DTC). Proper diagnosis of the side curtain airbag inflator and squib circuits requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate Diagnostic & Testing article.

REMOVAL

AIRBAG

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the side curtain airbag, or becoming entrapped between the side curtain airbag cushion and the headliner. Failure to observe this warning could result in occupant injuries upon airbag deployment.

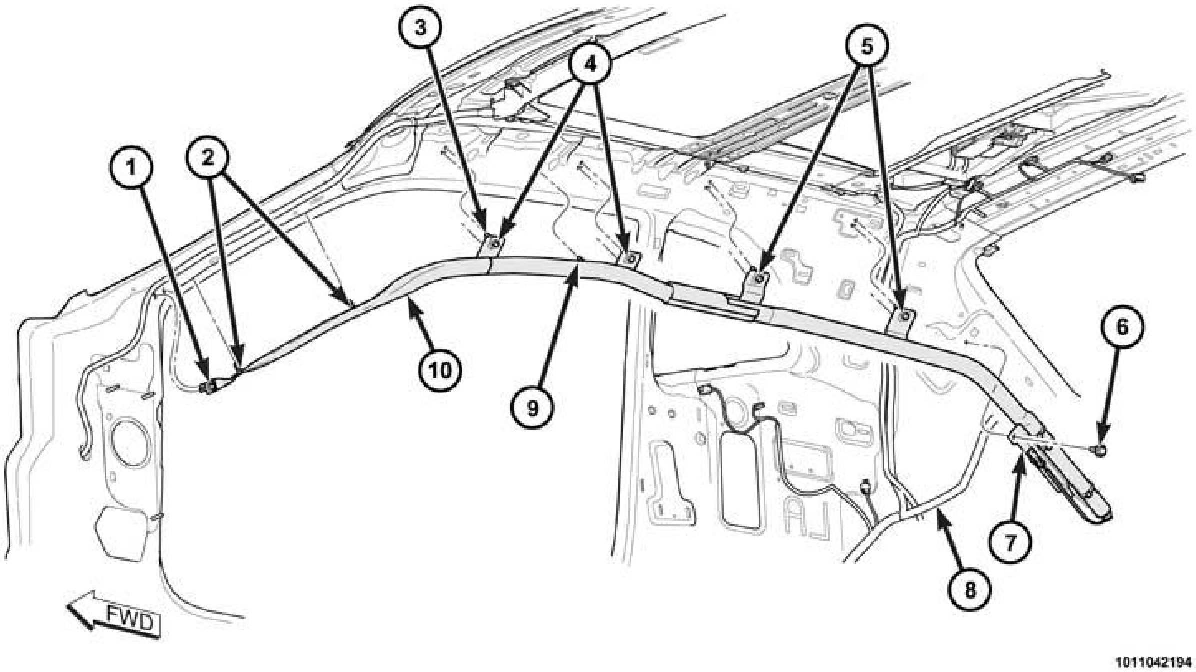

Fig. 28: Side AirBag Inflatable Curtain (SABIC), Bracket, Harness Connectors & Fasteners
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The following procedure is for replacement of an ineffective or damaged side curtain airbag (also known as Side AirBag Inflatable Curtain/SABIC). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the side curtain airbag has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to STANDARD PROCEDURE.**

1. Remove the rear seat back from the vehicle. Refer to **SEAT BACK, REAR, REMOVAL** .
2. Fully recline both front seat backs.
3. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.

   NOTE: **Use the headliner removal procedure to lower the headliner from the inner roof panel. The headliner will NOT be removed from the vehicle interior; therefore, it is NOT necessary to remove the windshield.**

4. Lower the headliner from the inner roof panel and allow it to rest within the vehicle interior. Refer to **HEADLINER, REMOVAL** .
5. Remove the screw (6) that secures the Side AirBag Inflatable Curtain (SABIC) inflator bracket (7) to the upper inner C-pillar.
6. Working from the back of the SABIC (10) to the front, remove the five screws (1, 4 and 5) that secure the SABIC mounting tabs to the weld nuts in the inner roof rail and the inner A-pillar.

7. Disconnect the body wire harness (8) connector for the SABIC (10) from the SABIC pigtail harness connector located on the inflator bracket on the upper C-pillar and disengage the retainer on the body wire harness from the inflator bracket hole.
8. Disengage the two plastic push-in retainers that secure the two rearward SABIC mounting tabs to the slots in the inner roof rail.
9. Disengage the two hooks of the SABIC inflator bracket from the upper inner C-pillar.
10. Disengage the plastic push-in retainer that secures the most rearward of the two forward SABIC mounting tabs (4) to the slot in the inner roof rail.
11. Disengage the plastic push-in retainer (9) that secures the SABIC to the inner roof rail above the door opening.
12. Disengage the plastic push-in retainer that secures the most forward SABIC mounting tab (3) to the slot in the inner roof rail.
13. Disengage the two plastic push-in retainers (2) that secure the SABIC front tether to the inner A-pillar.
14. Disengage the T-tab retainer that secures the end of the SABIC front tether to the slot in the inner A-pillar.
15. Remove the SABIC and inflator from the vehicle as a unit.

NOTE: **If the SABIC has been deployed, the support bracket on the C-pillar must also be replaced.**

SUPPORT BRACKET

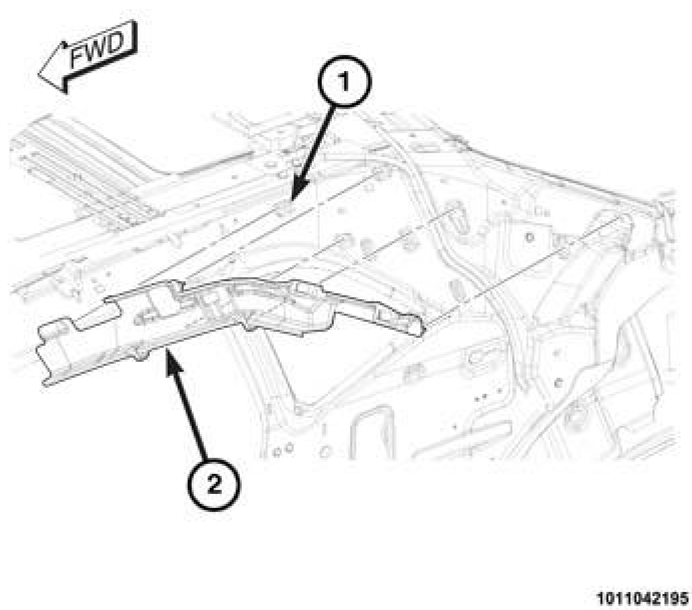

Fig. 29: Support Bracket & Slotted Holes
Courtesy of CHRYSLER GROUP, LLC

1. Remove the side curtain airbag (also known as Side AirBag Inflatable Curtain/SABIC) from the vehicle. Refer to **AIR BAG, SIDE CURTAIN, REMOVAL**.
2. Using a trim stick or another suitable wide flat-bladed tool, pry the support bracket (2) away from the upper inner C-pillar far enough to disengage each of the five clips that secure the support to the slotted holes (1).

3. Remove the support bracket from the vehicle and discard.

INSTALLATION

AIRBAG

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

WARNING: **To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.**

WARNING: **To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the side curtain airbag, or becoming entrapped between the side curtain airbag cushion and the headliner. Failure to observe this warning could result in occupant injuries upon airbag deployment.**

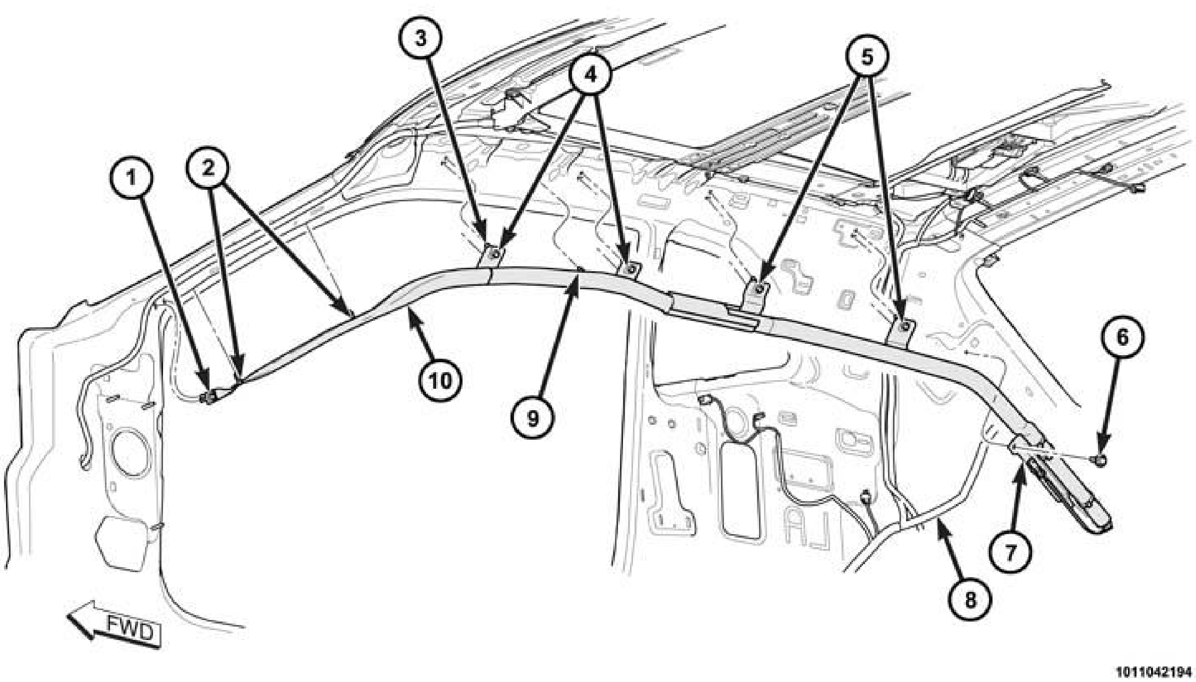

Fig. 30: Side AirBag Inflatable Curtain (SABIC), Bracket, Harness Connectors & Fasteners
Courtesy of CHRYSLER GROUP, LLC

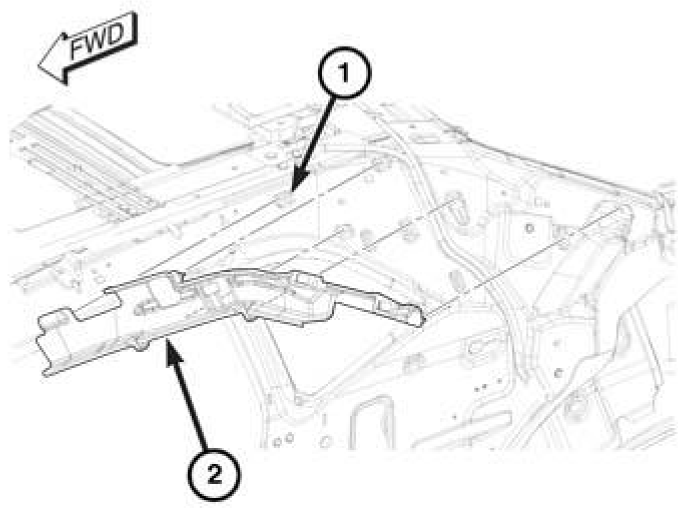
NOTE: **The following procedure is for replacement of an ineffective or damaged side**

curtain airbag (also known as Side AirBag Inflatable Curtain/SABIC). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the side curtain airbag has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to STANDARD PROCEDURE.

NOTE: **If the SABIC has been deployed, the support bracket on the C-pillar must also be replaced.**

1. Position the Side AirBag Inflatable Curtain (SABIC) (10) and inflator into the vehicle as a unit.
2. Engage the T-tab retainer that secures the end of the SABIC front tether (1) into the slot in the inner A-pillar.
3. Engage the two plastic push-in retainers (2) that secure the SABIC front tether to the inner A-pillar.
4. Engage the plastic push-in retainer that secures the most forward SABIC mounting tab (3) to the slot in the inner roof rail.
5. Engage the plastic push-in retainer (9) that secures the SABIC to the inner roof rail above the door opening.
6. Engage the plastic push-in retainer that secures the most rearward of the two forward SABIC mounting tabs (4) to the slot in the inner roof rail.
7. Engage the two hooks of the SABIC inflator bracket (7) with the upper inner C-pillar.
8. Engage the two plastic push-in retainers that secure the two rearward SABIC mounting tabs to the slots in the inner roof rail.
9. Reconnect the body wire harness (8) connector for the SABIC to the SABIC pigtail harness connector located on the inflator bracket on the upper C-pillar and engage the retainer on the body wire harness with the SABIC inflator bracket hole.
10. Working from the back of the SABIC (10) to the front, install and tighten the five screws (1, 4 and 5) that secure the SABIC mounting tabs to the weld nuts in the inner roof rail and the inner A-pillar. Tighten the screws to **SPECIFICATIONS**.
11. Install and tighten the screw (6) that secures the SABIC inflator bracket to the upper inner C-pillar. Tighten the screw to **SPECIFICATIONS**.
12. Reinstall the headliner onto the inner roof panel. Refer to **HEADLINER, INSTALLATION** .
13. Reinstall the rear seat back into the vehicle. Refer to **SEAT BACK, REAR, INSTALLATION** .
14. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

SUPPORT BRACKET



1011042195

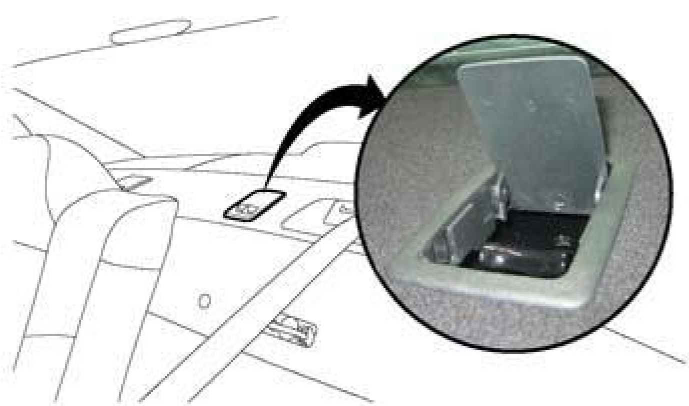
Fig. 31: Support Bracket & Slotted Holes
Courtesy of CHRYSLER GROUP, LLC

1. Position the support bracket (2) to the upper inner C-pillar.
2. Align the five clips on the support bracket with the slotted holes (1) in the inner C-pillar.
3. Using hand pressure press the support bracket against the upper inner C-pillar until each of the five clips is fully engaged.
4. Reinstall the side curtain airbag (also known as Side AirBag Inflatable Curtain/SABIC) into the vehicle. Refer to **AIR BAG, SIDE CURTAIN, INSTALLATION**.

ANCHOR, CHILD SEAT

DESCRIPTION

DESCRIPTION

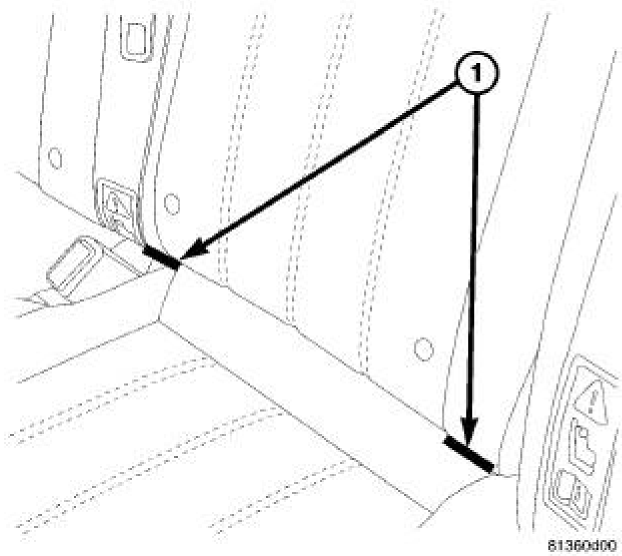


1023042255

[**Fig. 32: Child Seat Anchor**]
Courtesy of CHRYSLER GROUP, LLC

This vehicle is equipped with a Lower Anchors and Tether for CHildren (LATCH) child restraint anchorage system. The LATCH system provides for the installation of suitable child restraints in certain seating positions without using the standard equipment seat belt provided for that seating position. The rear seats in these vehicles are equipped with a fixed-position child restraint upper tether anchor and child restraint lower anchors (also known as ISOFIX anchors) for both the center and the two outboard seating positions.

The three upper tether anchors are integral to the rear shelf panel support. These anchors are each constructed of heavy-gauge steel reinforcement brackets integral to the rear shelf panel support and are concealed beneath individual trim cover and bezel units that are integral to the rear shelf trim panel. These upper tether anchors cannot be adjusted or repaired and, if ineffective or damaged, they must be replaced as a unit with the rear shelf panel support. The upper tether anchor trim covers and bezels are serviced as a unit with the rear shelf trim panel.



[**Fig. 33: Lower Anchors**]
Courtesy of CHRYSLER GROUP, LLC

The three pairs of lower anchors (1) are integral to an ISOFIX cross member that is permanently mounted to the center floor panel beneath the rear seat. These anchors are constructed from heavy-gauge round steel bar stock that is formed into a U-shape, then securely welded at each end to the cross member.

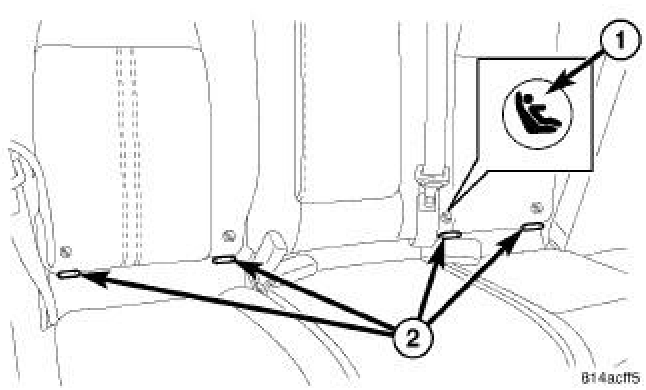


Fig. 34: Identifying Rear Seat Lower Anchors & Markers With An Imprinted Child Seat Icon
Courtesy of CHRYSLER GROUP, LLC

The rear seat lower anchors (2) are each accessed from the front of their respective seating position where the seat back meets the seat cushion. Round molded plastic markers (1) with an imprinted child seat icon help identify the anchor locations as they may be otherwise difficult to see with the seat back in the upright position. These lower anchors cannot be adjusted or repaired and, if ineffective or damaged, they must be replaced as a unit with the isofix cross member of the center floor panel.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler MoparÃ® Parts Catalog.

OPERATION

OPERATION

All vehicles manufactured for sale in the United States and Canada are required to be equipped with a Lower Anchors and Tether for CHildren (LATCH) child restraint anchorage system. The rear seats in this vehicle have three pairs of anchor provisions for installing up to three LATCH-compatible child seats.

With LATCH, child seats are secured by direct attachment to the vehicle structure, rather than by the seat belts. With LATCH-compatible child seats, lower (also known as ISOFIX) anchors attach to the vehicle structure through heavy-gauge wire loops located at the intersection between the seat cushion and the seat back surfaces.

Three upper tether anchors are integral to the rear shelf panel support to secure the top tether strap of child seats equipped with this feature. These upper tether anchors work with both LATCH-compatible and other child seats equipped with a top tether strap.

The owner's information packet in the vehicle glove box contains details and suggestions on the proper use of all of the factory-installed child restraint anchors.

BUCKLE, SEAT BELT

REMOVAL

FRONT SEAT

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt

tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler MoparÃ® Parts Catalog.

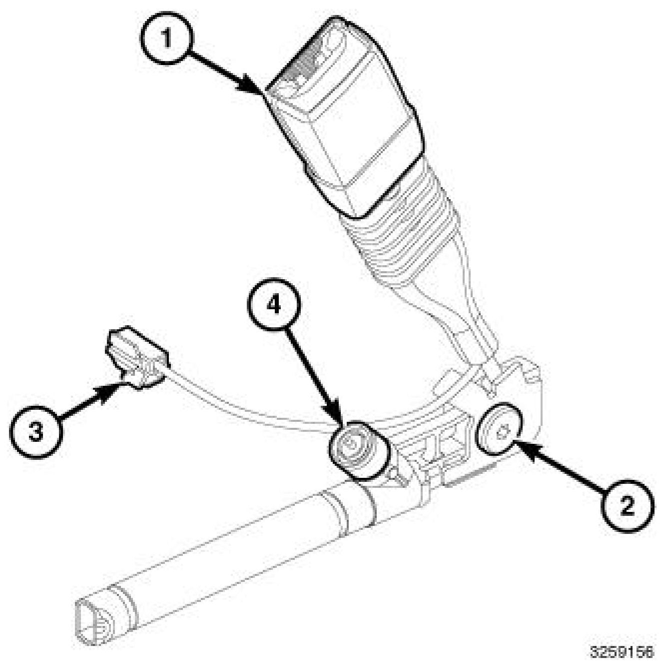

Fig. 35: Seat Belt Tensioner Initiator, Buckle And Tensioner, Switch Pigtail Wire Connector & Screw
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following procedure is for replacement of an ineffective or damaged seat belt buckle unit. The front seat belt buckle also includes a seat belt tensioner. If the front seat belt buckle is ineffective or damaged, but the seat belt tensioner is not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the seat belt tensioner has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the unit from the vehicle. Refer to STANDARD PROCEDURE.

1. Position the front seat for easiest access to the seat mounting hardware.
2. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
3. Remove the front seat from the vehicle. Refer to **SEAT, FRONT, REMOVAL** .
4. Disconnect the seat wire harness connector from the seat belt tensioner initiator (4).
5. Disconnect the seat belt switch pigtail wire connector (3) from the seat wire harness connector.
6. Remove the screw (2) that secures the front seat belt buckle lower anchor to the bracket at the back of the seat cushion frame.
7. Remove the buckle and tensioner (1) from the front seat as a unit.

REAR SEAT

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler MoparÃ® Parts Catalog.

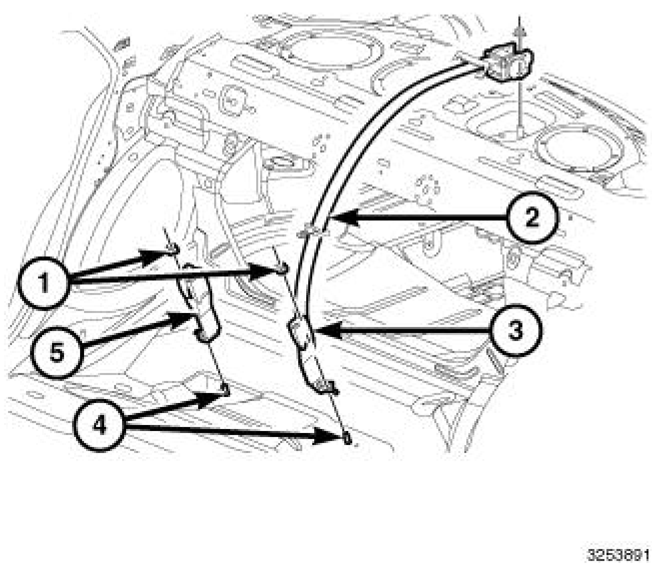

Fig. 36: Center Rear Seating Position Buckles, Left Outboard Rear Seating Position Buckle & Center Rear Seating Position Seat Belt And Retractor
Courtesy of CHRYSLER GROUP, LLC

NOTE: The right outboard and center rear seating position buckles (5) are serviced only as a unit. The left outboard rear seating position buckle (3) is integral to

the center rear seating position seat belt and retractor (2) lower anchor. Refer to RETRACTOR, SEAT BELT, REMOVAL.

1. Remove the rear seat cushion from the vehicle. Refer to **COVER, SEAT CUSHION, REAR, REMOVAL** .
2. Remove the nut (1) that secures the anchor plate of the right outboard and center rear seating position buckles (5) to the stud (4) on the center floor panel.
3. Remove the buckle unit from the vehicle.

INSTALLATION

FRONT SEAT

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler MoparÃ® Parts Catalog.

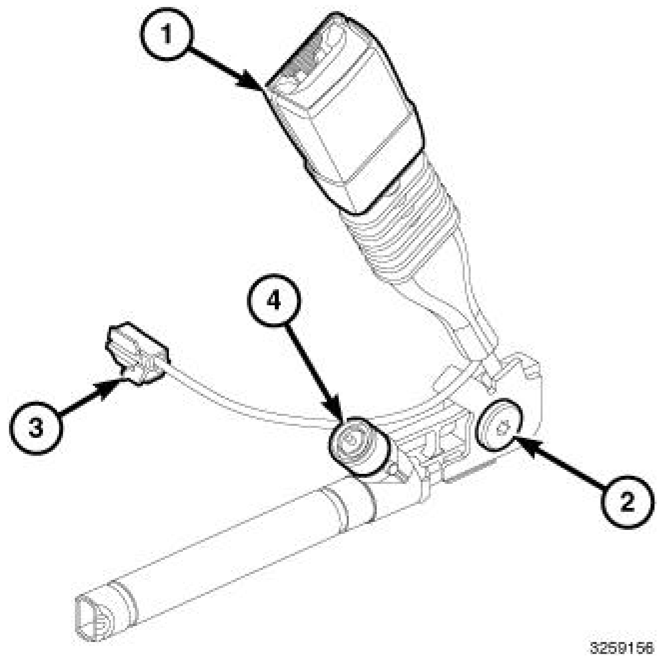

Fig. 37: Seat Belt Tensioner Initiator, Buckle And Tensioner, Switch Pigtail Wire Connector & Screw
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The following procedure is for replacement of an ineffective or damaged seat belt buckle unit. The front seat belt buckle also includes a seat belt tensioner. If the front seat belt buckle is ineffective or damaged, but the seat belt tensioner is not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the seat belt tensioner has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the unit from the vehicle. Refer to STANDARD PROCEDURE.**

1. Position the front seat belt buckle and tensioner (1) lower anchor to the bracket at the back of the seat cushion frame.
2. Install and tighten the screw (2) that secures the lower anchor to the seat cushion frame. Tighten the screw to **SPECIFICATIONS**.
3. Reconnect the seat belt switch pigtail wire connector (3) to the seat wire harness connector.
4. Reconnect the seat wire harness connector to the seat belt tensioner initiator (4).
5. Reinstall the front seat into the vehicle. Refer to **SEAT, FRONT, INSTALLATION** .
6. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

REAR SEAT

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a**

damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler MoparÃ® Parts Catalog.

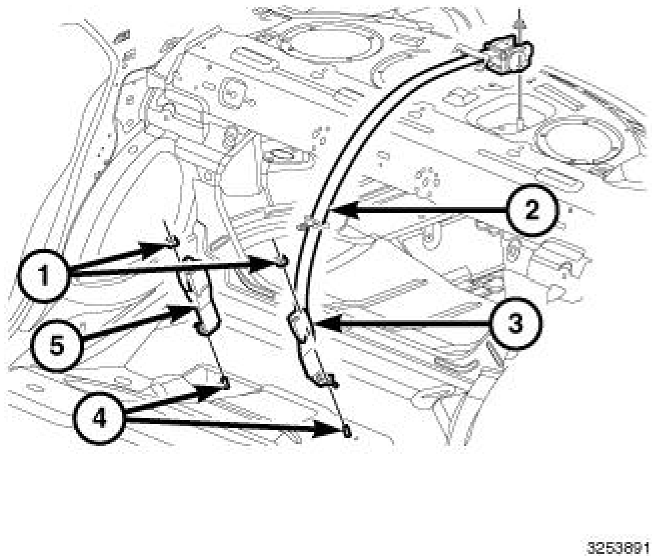

Fig. 38: Center Rear Seating Position Buckles, Left Outboard Rear Seating Position Buckle & Center Rear Seating Position Seat Belt And Retractor
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The right outboard and center rear seating position buckles (5) are serviced only as a unit. The left outboard rear seating position buckle (3) is integral to the center rear seating position seat belt and retractor (2) lower anchor. Refer to RETRACTOR, SEAT BELT, INSTALLATION.**

1. Position the anchor plate of the right outboard and center rear seating position buckles (5) onto the stud (4) on the center floor panel. Be certain to engage the anti-rotation tab of the anchor plate into the clearance hole in the floor panel.
2. Install and tighten the nut (1) that secures buckle anchor plate to the floor. Tighten the nut to **SPECIFICATIONS**.
3. Reinstall the rear seat cushion into the vehicle. Refer to **COVER, SEAT CUSHION, REAR, INSTALLATION** .

CLOCKSPRING

DESCRIPTION

DESCRIPTION

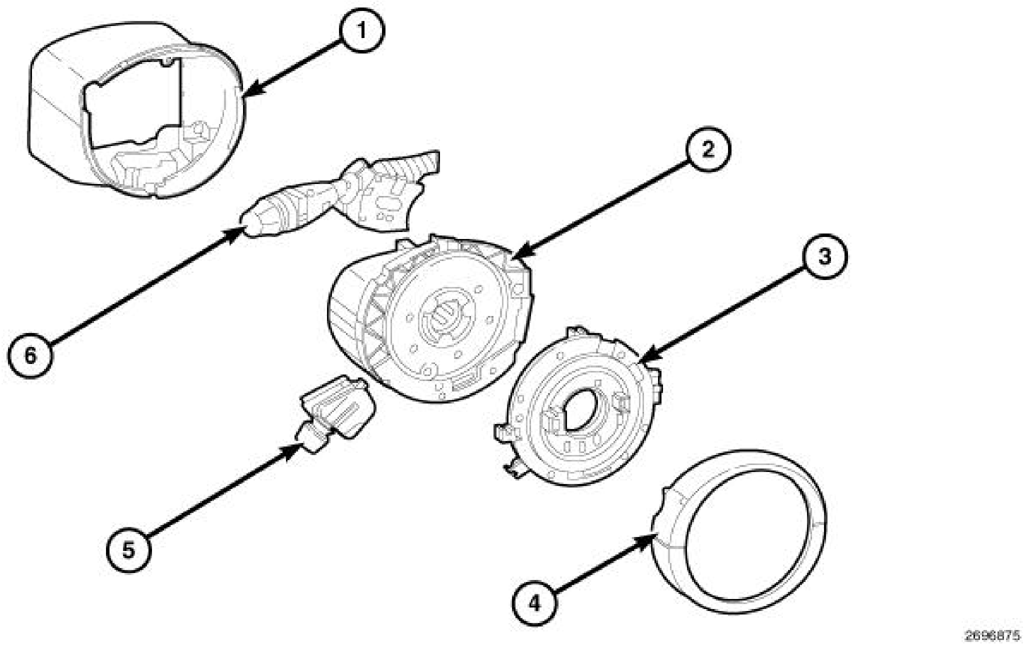

Fig. 39: Steering Column Shroud, Steering Angle Sensor (SAS), Clockspring, Telescope Switch & Trim Cover
Courtesy of CHRYSLER GROUP, LLC

The clockspring (3) for this vehicle is integral to the Steering Column Control Module (SCCM). The clockspring includes an integral, internal turn signal cancel cam. The SCCM is secured near the top of the steering column below the steering wheel. In addition to the clockspring the SCCM includes the steering column shroud (1), the Steering Angle Sensor (SAS) (2), the multifunction switch (6), a power adjustable steering column tilt and telescope switch (5) for vehicles so equipped and a trim cover (4).

Within the plastic clockspring case is a spool-like molded clear plastic rotor with an exposed hub. The upper surface of the rotor hub has a large center hole, two short pigtail wires with connectors, and two connector receptacles that face toward the steering wheel. The inner surface of the clockspring rotor hub has keyway features that are engaged by lug features on the outer circumference of the steering wheel hub. These interlocking features allow the steering wheel to drive the clockspring and SAS and also unlock the clockspring rotor when the steering wheel has been properly installed.

The SCCM includes an integral connector receptacle that faces toward the instrument panel and is connected to the vehicle electrical system through a single takeout and connector of the instrument panel wire harness. The instrument panel wire harness take out has been intentionally provided with additional length to facilitate service removal and installation of the SCCM. However, following SCCM installation, this additional length must be pulled back and secured to the instrument panel structure to prevent undesirable noises while driving.

Wound around the rotor spool within the clockspring case are long ribbon-like tapes that consist of several thin copper wire leads sandwiched between two thin plastic membranes. The outer end of the tapes terminate at the connector receptacle that faces the instrument panel, while the inner end of the tapes terminate at the pigtail wires and connector receptacles on the hub of the clockspring rotor that face the steering wheel. The outer surface of the rotor spool hub within the clockspring case also has the integral lobes of the turn signal cancel cam.

The clear plastic clockspring rotor has an outer band that has a translucent or frosted appearance except for a small, clear inspection window area in the lower right quadrant. The clockspring tape has several black squares

that are only visible through the clear inspection window when the clockspring is properly centered. If these squares are not visible through the inspection window, clockspring centering has been compromised and the entire SCCM must be replaced with a new unit.

The service replacement SCCM is shipped with the clockspring pre-centered and with a red molded plastic locking tab installed. The locking tab secures the centered clockspring rotor to the clockspring case during shipment and handling, but must be removed after the SCCM is installed on the steering column and before the steering wheel can be installed. The clockspring cannot be repaired. If the clockspring is ineffective, damaged, if clockspring centering is compromised or if the Driver AirBag (DAB) has been deployed the entire SCCM unit must be replaced. Refer to **MODULE, STEERING COLUMN CONTROL, DESCRIPTION** .

OPERATION

OPERATION

The clockspring is a mechanical electrical circuit component that is used to provide continuous electrical continuity between the fixed instrument panel wire harness and certain electrical components mounted on or in the rotating steering wheel. On this vehicle the rotating electrical components include the Driver AirBag (DAB), the horn switch, the speed control switch, the remote radio switches, the hands-free communication switches and the Electronic Vehicle Information Center (EVIC) control switches, if the vehicle is so equipped.

The clockspring is integral to the Steering Column Control Module (SCCM) positioned and secured near the top of the steering column. Refer to **MODULE, STEERING COLUMN CONTROL, OPERATION** . The turn signal cancel cam is integral to the rim of the clockspring rotor hub spool within the clockspring case so it also moves with the rotation of the steering wheel. Two short, sleeved pigtail wires on the upper surface of the clockspring rotor connect the clockspring to the DAB, while a steering wheel wire harness connected to the connector receptacles on the upper surface of the clockspring rotor completes circuits for the various steering wheel-mounted switches and the heated steering wheel, if the vehicle is so equipped.

Like the clockspring in a timepiece, the clockspring tape and conductors have travel limits and can be damaged by being wound too tightly during full stop-to-stop steering wheel rotation. To prevent this from occurring, the clockspring is centered when it is installed on the steering column. Centering the clockspring indexes the clockspring tape to the movable steering components so that the tape can operate within its designed travel limits.

However, if the steering shaft is disconnected from the steering gear the clockspring rotor spool can change position relative to other movable steering components. Clockspring centering must be confirmed by viewing the inspection window on the clockspring rotor. If the black squares of the clockspring tape are not visible in the inspection window, clockspring centering has been compromised and the entire SCCM must be replaced with a new unit. Refer to **MODULE, STEERING COLUMN CONTROL, INSTALLATION** .

Service replacement clocksprings are shipped pre-centered within the SCCM and with a plastic locking tab installed. This locking tab should not be removed until the SCCM has been properly installed on the steering column. If the locking tab is removed before the SCCM is installed on a steering column, clockspring centering must be confirmed by viewing the inspection window on the clockspring rotor. If the black squares of the clockspring tape are not visible in the inspection window, the SCCM must be replaced with a new unit. Proper clockspring installation may also be confirmed by viewing the Steering Angle Sensor (SAS) data using a diagnostic scan tool.

The hard wired clockspring circuits to the SCCM microcontroller may be diagnosed using conventional

diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SCCM microcontroller or the electronic controls and communication between other modules and devices that provide some features of the Supplemental Restraint System (SRS). The most reliable, efficient and accurate means to diagnose the electronic controls and communication related to SRS operation requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate Diagnostic & Testing article.

STANDARD PROCEDURE

STANDARD PROCEDURE - CLOCKSPRING CENTERING

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

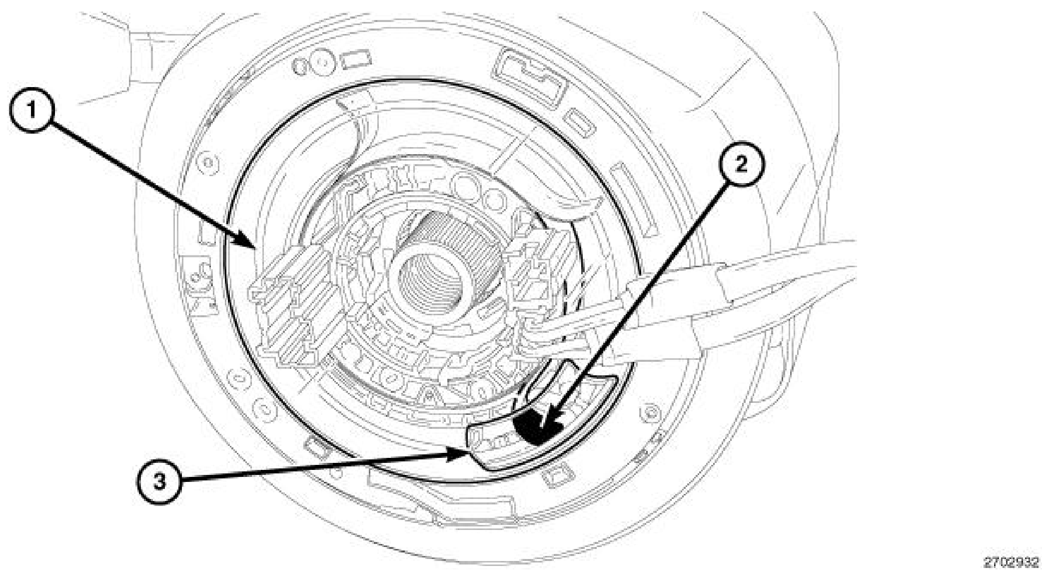

Fig. 40: Inspection Window, Clockspring Rotor & Black Squares
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Always turn the steering wheel until the front wheels are in the straight-ahead position. Then, prior to disconnecting the steering column from the steering gear, lock the steering wheel to the steering column. If clockspring centering has been compromised for ANY reason, the entire Steering Column Control Module (SCCM) and clockspring unit MUST be replaced with a new unit.

Like the clockspring in a timepiece, the clockspring tape has travel limits and can be damaged by being wound too tightly during full stop-to-stop steering wheel rotation. To prevent this from occurring, the clockspring is centered when it is installed on the steering column. Centering the clockspring indexes the clockspring tape to the movable steering components so that the tape can operate within its designed travel limits. However, if the

steering shaft is disconnected from the steering gear, the clockspring rotor spool can change position relative to the fixed steering components.

Clockspring centering must always be confirmed by viewing the inspection window (3) on the clockspring rotor (1). If the black squares (2) on the clockspring tape are not visible through the inspection window, clockspring centering has been compromised and the Steering Column Control Module (SCCM) must be replaced with a new unit. Refer to **MODULE, STEERING COLUMN CONTROL, INSTALLATION** .

The service replacement SCCM is shipped with the clockspring pre-centered and with a red plastic locking tab installed. This locking tab should not be removed until the SCCM has been properly installed on the steering column. If the locking tab is removed before the SCCM is installed on a steering column, clockspring centering must be confirmed by viewing the black squares on the clockspring tape through the inspection window on the clockspring rotor. If the black squares of the clockspring tape are not visible through the inspection window, clockspring centering has been compromised and the SCCM must be replaced with a new unit. Refer to **MODULE, STEERING COLUMN CONTROL, INSTALLATION** . Proper clockspring installation may also be confirmed by viewing the Steering Angle Sensor (SAS) data using a diagnostic scan tool.

REMOVAL

REMOVAL

NOTE: **The clockspring for this vehicle is integral to the Steering Column Control Module (SCCM). If any function of the clockspring is ineffective, or if the clockspring is damaged, the entire SCCM unit must be replaced. Refer to MODULE, STEERING COLUMN CONTROL, REMOVAL .**

INSTALLATION

INSTALLATION

NOTE: **The clockspring for this vehicle is integral to the Steering Column Control Module (SCCM). If any function of the clockspring is ineffective, or if the clockspring is damaged, the entire SCCM unit must be replaced. Refer to MODULE, STEERING COLUMN CONTROL, INSTALLATION .**

MODULE, OCCUPANT RESTRAINT CONTROLLER

DESCRIPTION

DESCRIPTION

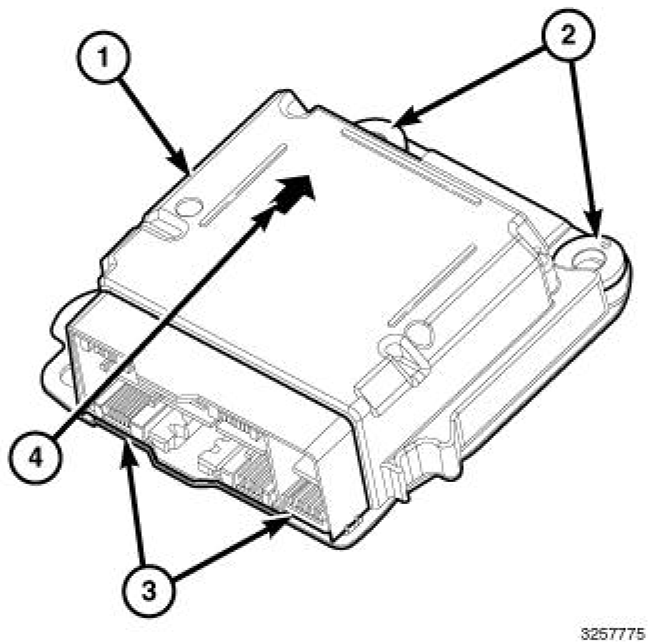

Fig. 41: Occupant Restraint Controller (ORC), Arrow, Integral Mounting Flanges & Electrical Connector Receptacles
Courtesy of CHRYSLER GROUP, LLC

The Occupant Restraint Controller (ORC) (1) is secured by three screws to a stamped steel mounting bracket on the top of the floor panel transmission tunnel near the dash panel and beneath the instrument panel center support in the passenger compartment of the vehicle. Concealed within a hollow in the center of the ORC housing is the electronic circuitry of the ORC which includes a microcontroller, an electronic impact sensor, a rollover sensor, an electronic safing sensor and an energy storage capacitor. A stamped metal cover plate is secured to the bottom of the ORC housing to enclose and protect the internal electronic circuitry and components.

An arrow (4) printed on the label on the top of the ORC housing provides a visual verification of the proper orientation of the unit, and should always be pointed toward the front of the vehicle. The ORC housing has integral mounting flanges (2) on the right and left front and the left rear corner. The stamped metal cover plate has two integral locating pins on its lower surface. Two molded plastic electrical connector receptacles (3) exit the rearward facing side of the ORC housing. These receptacles connect the ORC to the vehicle electrical system through two dedicated take outs and connectors, one from the instrument panel wire harness and the second from the body wire harness.

The impact sensor and safing sensor internal to the ORC are calibrated for the specific vehicle, and are only serviced as a unit with the ORC. In addition, there are unique versions of the ORC for vehicles with or without certain optional Supplemental Restraint System (SRS) components. The ORC cannot be repaired or adjusted and, if damaged or ineffective, it must be replaced.

OPERATION

OPERATION

The microcontroller within the Occupant Restraint Controller (ORC) contains the Supplemental Restraint System (SRS) logic circuits and controls all of the SRS components. The ORC uses On-Board Diagnostics (OBD) and can communicate with other electronic modules in the vehicle as well as with the diagnostic scan

tool using the Controller Area Network (CAN) data bus. This method of communication is used for control of the airbag indicator in the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) and for SRS diagnosis and testing through the 16-way data link connector located on the driver side lower edge of the instrument panel.

The ORC microcontroller continuously monitors all of the SRS electrical circuits to determine the system readiness. If the ORC detects a monitored system fault, it sets an active and stored Diagnostic Trouble Code (DTC) and sends electronic messages to the IC over the CAN data bus to turn On the airbag indicator. An active fault only remains for the duration of the fault, or in some cases for the duration of the current ignition cycle, while a stored fault causes a DTC to be stored in memory by the ORC. For some DTCs, if a fault does not recur for a number of ignition cycles, the ORC will automatically erase the stored DTC. For other internal faults, the stored DTC is latched forever.

The ORC receives battery current through two circuits; a fused ignition switch output (run) circuit through a fuse in the rear Power Distribution Center (PDC) and a fused ignition switch output (run-start) circuit through a second fuse in the rear PDC. The ORC receives ground through a ground circuit and take out of the instrument panel wire harness that is secured by a ground screw to the body sheet metal. These connections allow the ORC to be operational whenever the status of the ignition switch is Start or On.

The ORC also contains an energy-storage capacitor. When the ignition switch status is Start or On, this capacitor is continually being charged with enough electrical energy to deploy the SRS components for up to one second following a battery disconnect or failure. The purpose of the capacitor is to provide backup SRS protection in case there is a loss of battery current supply to the ORC during an impact.

Various sensors within the ORC are continuously monitored by the ORC logic. These internal sensors, along with several external impact sensor inputs allow the ORC to determine both the severity of an impact and to verify the necessity for deployment of any SRS components. Two remote front impact sensors are located on the back of the right and left vertical members of the radiator support near the front of the vehicle. The electronic impact sensors are accelerometers that sense the rate of vehicle deceleration, which provides verification of the direction and severity of an impact.

The ORC also monitors inputs from the seat track position sensors, seat belt switches, an internal rollover sensor and six additional remote side impact sensors located on the left and right front door module carriers, on the right and left lower B-pillars and on the right and left C-pillars near the belt line to control deployment of the side curtain airbag units and seat (also known as pelvic and thorax) airbags. On vehicles so equipped, the ORC also uses the passenger side seat belt switch input along with an input from the Occupant Detection Sensor (ODS) in the passenger front seat cushion to support the passenger belt alert feature, and will send electronic messages to the IC to illuminate the seat belt indicator when appropriate.

The impact sensors within the ORC are electronic accelerometer sensors that provide an additional logic input to the ORC microcontroller. These sensors are used to verify the need for a SRS component deployment by detecting impact energy of a lesser magnitude than that of the primary electronic impact sensors, and must exceed a safing threshold in order for the SRS components to deploy. On vehicles equipped with side curtain airbags or seat airbags, a separate impact sensor within the ORC provides confirmation to the ORC microcontroller of side impact forces. This separate sensor is a bi-directional unit that detects impact forces from either side of the vehicle.

Pre-programmed decision algorithms in the ORC microcontroller determine when the deceleration rate as signaled by the impact sensors indicate an impact that is severe enough to require SRS protection and, based

upon the severity of the monitored impact, determines the level of front airbag deployment force required for each front seating position. When the programmed conditions are met, the ORC sends the proper electrical signals to deploy the dual multistage front airbags at the programmed force levels, the front seat belt tensioners and, if the vehicle is so equipped, the seat airbags and either side curtain airbag unit.

The hard wired inputs and outputs for the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the ORC or the electronic controls and communication between other modules and devices that provide some features of the SRS. The most reliable, efficient and accurate means to diagnose the ORC or the electronic controls and communication related to SRS operation requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate Diagnostic & Testing article.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with side curtain airbags, disable the Supplemental Restraint System (SRS) before attempting any Occupant Restraint Controller (ORC) diagnosis or service. The ORC may contain a rollover sensor, which enables the system to deploy the side SRS components in the event of a vehicle rollover event. If an ORC containing a rollover sensor is accidentally rolled during service while still connected to battery power, the side SRS components will deploy. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the Occupant Restraint Controller (ORC), as it can damage the impact sensor or affect its calibration. The ORC contains the impact sensor, which enables the system to deploy the Supplemental Restraint System (SRS) components. If an ORC is accidentally dropped during service, the module must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper SRS component deployment.

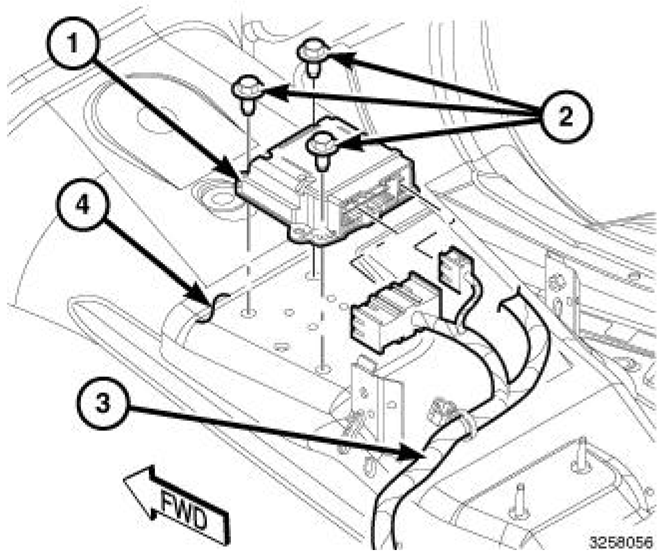

Fig. 42: Floor Panel Transmission Tunnel, Instrument Panel And Body Wire Harness, Three Screws & Occupant Restraint Controller (ORC)
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the center console from the top of the floor panel transmission tunnel (4). Refer to **CONSOLE, FLOOR, REMOVAL** .
3. Remove the console floor duct from the floor panel transmission tunnel. Refer to **DUCT, FLOOR CONSOLE, REMOVAL** .

NOTE: **If equipped with a cable-type floor shifter, it is not necessary to disconnect the shift cable from the shifter.**

4. If equipped with a floor shifter:
   a. Disconnect the wire harness connectors from the shifter.
   b. Remove the four nuts that secure the shifter to the weld studs on the floor panel transmission tunnel.
   c. Remove the shifter from the transmission tunnel. If it is a cable-type shifter, carefully position the shifter and cable out of the way over the right side of the transmission tunnel.
5. Remove the switch bank and bezel from the instrument panel center stack. Refer to **POD, SWITCH BANK, REMOVAL** .
6. Disconnect the instrument panel and body wire harness (3) connectors from the Occupant Restraint Controller (ORC) (1) connector receptacles located on the rearward facing side of the module.
7. Reach through the instrument panel center stack openings to access and cut the sound deadening material along the right side of the ORC.
8. Reach around and behind the left side of the instrument panel center stack support structure to access and cut the sound deadening material along the forward-facing side of the ORC.
9. Pull the sound deadening material over the left side of the ORC far enough to access the mounting provisions.

10. Remove the three screws (2) that secure the ORC to the top of the floor panel transmission tunnel.
11. Remove the ORC from the vehicle.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with side curtain airbags, disable the Supplemental Restraint System (SRS) before attempting any Occupant Restraint Controller (ORC) diagnosis or service. The ORC may contain a rollover sensor, which enables the system to deploy the side SRS components in the event of a vehicle rollover event. If an ORC containing a rollover sensor is accidentally rolled during service while still connected to battery power, the side SRS components will deploy. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the Occupant Restraint Controller (ORC), as it can damage the impact sensor or affect its calibration. The ORC contains the impact sensor, which enables the system to deploy the Supplemental Restraint System (SRS) components. If an ORC is accidentally dropped during service, the module must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper SRS component deployment.

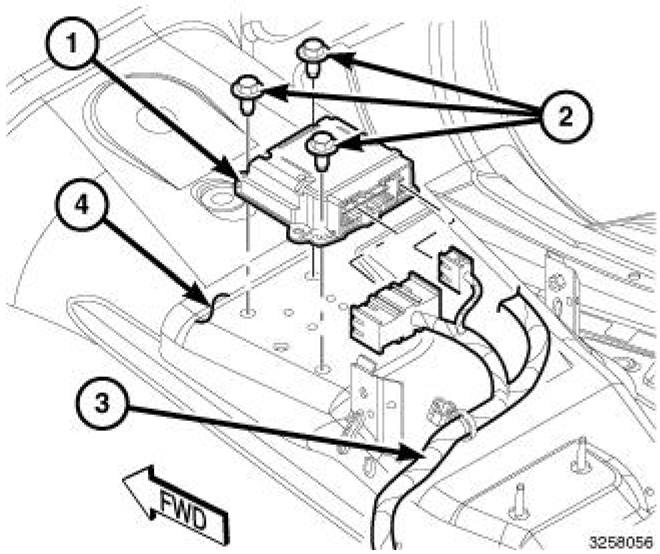

Fig. 43: Floor Panel Transmission Tunnel, Instrument Panel And Body Wire Harness, Three Screws & Occupant Restraint Controller (ORC)
Courtesy of CHRYSLER GROUP, LLC

1. Carefully position the Occupant Restraint Controller (ORC) (1) onto the floor panel transmission tunnel (4). When the ORC is correctly positioned, the orientation arrow on the ORC label will be pointed forward in the vehicle.
2. Install and tighten the three screws (2) that secure the ORC to the floor panel transmission tunnel. Tighten the screws to **SPECIFICATIONS**.
3. Restore the flap of sound deadening material that was cut during the removal procedure over and around the ORC.
4. Reconnect the instrument panel and body wire harness (3) connectors to the ORC connector receptacles located on the rearward facing side of the module. Be certain that the latches and the locks on both connectors are each fully engaged.
5. Reinstall the switch bank and bezel into the instrument panel center stack. Refer to **POD, SWITCH BANK, INSTALLATION** .
6. If equipped with a floor shifter:
   a. Position the shifter over the four weld studs on the top of the floor panel transmission tunnel.
   b. Install and tighten the four nuts that secure the shifter to the weld studs on the floor panel transmission tunnel. Tighten the nuts securely.
   c. Reconnect the wire harness connectors to the shifter.
7. Reinstall the console floor duct onto the floor panel transmission tunnel. Refer to **DUCT, FLOOR CONSOLE, INSTALLATION** .
8. Reinstall the center console onto the top of the floor panel transmission tunnel. Refer to **CONSOLE, FLOOR, INSTALLATION** .
9. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

RESTRAINT, ACTIVE HEAD

DESCRIPTION

DESCRIPTION

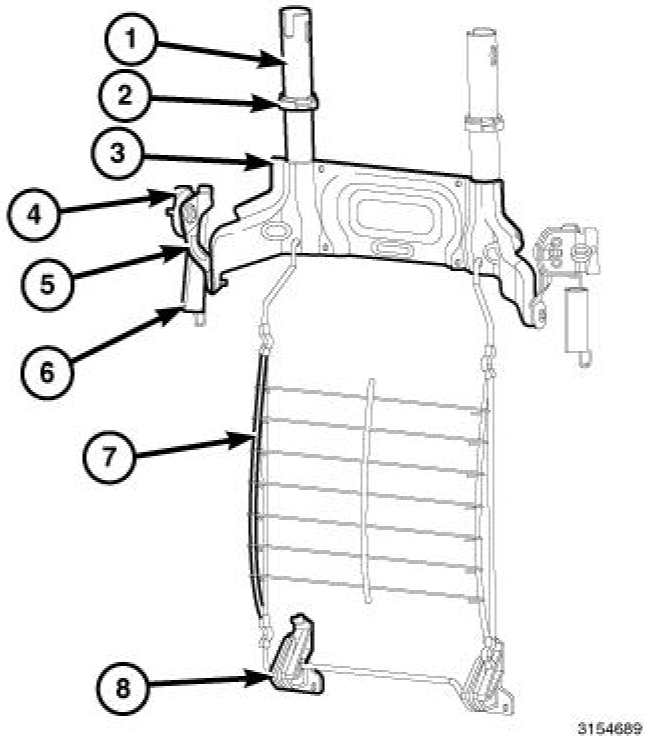

Fig. 44: Steel Headrest Guide Tubes, Fulcrum Bushing, Brackets, Steel Pivot Link, Spring & Static Lumbar Assembly
Courtesy of CHRYSLER GROUP, LLC

Active Head Restraint (AHR) units are standard equipment for both front seating positions in this vehicle. One inertia-activated AHR unit is located atop each front seat back. Outwardly, an inertia-activated AHR appears the same as a non-active head restraint. The mechanical components that articulate the inertia-activated AHR headrest pad are all concealed within the front seat back frame assembly.

At the top of the seat back frame are two stamped steel headrest guide tubes (1). The guide tubes are each inserted through a molded plastic fulcrum bushing (2) installed in the upper seat back frame member and are permanently fixed to a movable stamped steel armature bracket (3) located just below the upper frame member near the top of the seat back. The armature bracket is secured to a stamped steel pivot link (5) at each side that pivots on a screw threaded into a mounting bracket (4) welded to each side member of the seat back frame. The pivot links each have a spring (6) attached to a lever opposite the armature bracket attachment that is anchored to the seat back frame side member below, which provides the spring-loaded return action of the inertia mechanism.

The upper end of the static lumbar assembly (7) is secured at each side to the base of the armature bracket. Each side of the lower end of the lumbar assembly is engaged in a ramp bracket (8) riveted to the lower seat back frame member. The optional power lumbar assembly (not shown) is secured to the armature bracket at the top and the ramp brackets at the bottom in an identical manner as the standard equipment static lumbar assembly.

The inertia-activated AHR linkage cannot be repaired. If damaged or ineffective, it must be replaced as a unit with a new seat back frame unit. However, following an AHR deployment if no physical damage to the unit has occurred, unlike many other Supplemental Restraint System (SRS) components, the spring-loaded inertia-

activated AHR linkage will reset itself for reuse.

OPERATION

OPERATION

The inertia-activated Active Head Restraint (AHR) units are deployed and reset automatically by the mechanism contained within each front seat back assembly. During a rear impact, inertia drives the seat occupant rearward into the seat back, loading the seat lumbar assembly. The ramp brackets at the base of the lumbar assembly translate this rearward travel into a vertical motion. The vertical motion of the lumbar assembly is then transmitted to the armature bracket.

Through the rotation of the pivot links at each side of the armature bracket, the vertical motion of the lumbar assembly is converted to a slightly forward and upward arc of the armature bracket, headrest guide tubes and headrest that is designed to reduce the space between the back of the head of the seat occupant and the head restraint pad. Closing this space catches the head of the seat occupant during a low speed rear impact collision event and is important in reducing or eliminating potentially debilitating cervical (also known as whiplash) injuries.

Unless damaged, following the rear impact, the return spring on the pivot link at each side of the armature bracket returns the mechanical components within the seat back and the headrest to their non-loaded positions.

RETRACTOR, SEAT BELT

DESCRIPTION

DESCRIPTION

Both front seating position seat belts are equipped with a Constant Force Retractor (CFR), while the seat belt retractors used in all seating positions include an inertia-type, Emergency Locking Retractor (ELR) mechanism as standard equipment. However, the ELR for all seating positions except the driver side front are mechanically switchable from an ELR to an Automatic Locking Retractor (ALR).

The CFR, ELR and ALR features are all integral to the seat belt retractor unit mechanism that is concealed beneath a molded plastic cover located on one side of the retractor spool. The CFR, ELR and ALR features cannot be adjusted or repaired and, if ineffective or damaged, the entire seat belt and retractor must be replaced as a unit.

OPERATION

OPERATION

The Constant Force Retractors (CFR) used for both front seating positions provide a constant force load-limiting feature. This load-limiting feature helps to limit the maximum force on the belt webbing to help absorb the energy of the upper torso during an impact event. The CFR feature also helps to offset any extreme torso loading that might occur as the seat belt webbing is automatically retracted by deployment of the belt tensioners in conjunction with a front airbag deployment.

The primary function of the switchable Emergency Locking Retractor (ELR) to Automatic Locking Retractor (ALR) feature is to securely accommodate an infant or child booster seat in any seating position of the vehicle except the driver side front seat without the need for a self-cinching seat belt tip half latch plate unit or another

supplemental device that would be required to prevent the seat belt webbing from unwinding freely from the retractor spool of an inertia-type ELR in situations where the minimum inertia locking threshold has not been achieved.

The locked mode of the ALR is engaged and the retractor is switched from operating as a standard inertia-type ELR by first buckling the combination lap and shoulder belt buckle. Then all of the shoulder belt webbing is pulled out from the retractor. Once all of the belt webbing is extracted from the retractor spool, the retractor will automatically become engaged in the pre-locked ALR mode and will make a light, audible clicking or ratchet-like sound as the shoulder belt is allowed to retract onto the spool to provide an audible confirmation that the ALR mode is engaged. Once the ALR mode is engaged, the retractor will remain locked and the belt will remain tight around whatever it is restraining.

The retractor is returned to standard ELR (inertia) mode by unbuckling the combination lap and shoulder belt buckle and allowing the belt webbing to be almost fully retracted back onto the retractor spool. The ELR mode is confirmed by the absence of the light, audible clicking or ratchet-like sound as the belt webbing retracts. This mode will allow the belt to unwind from and wind onto the retractor spool freely unless and until a predetermined inertia load threshold is sensed, or until the retractor is again switched to the ALR mode.

REMOVAL

FRONT

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler MoparÃ® Parts Catalog.

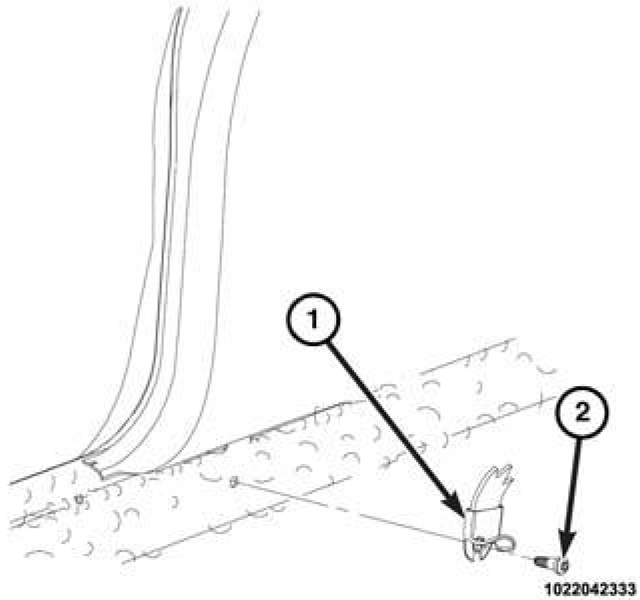

Fig. 45: Front Seat Belt Lower Anchor Plate & Screw
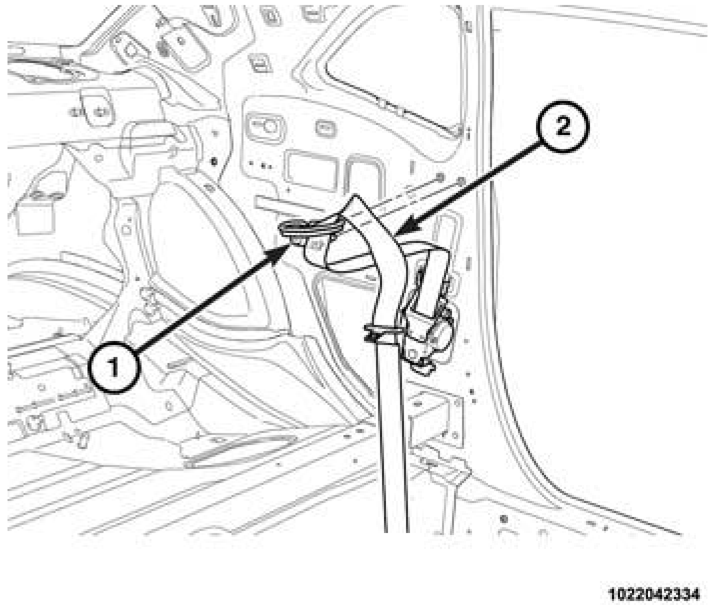
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The following procedure is for replacement of an ineffective or damaged seat belt and retractor unit. The front outboard retractors also include a seat belt tensioner. If the front seat belt or retractor is ineffective or damaged, but the seat belt tensioner is not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the seat belt tensioner has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the unit from the vehicle. Refer to STANDARD PROCEDURE.**

NOTE: **All seat belt retractors except the driver side front retractor include a switchable automatic locking mechanism. Refer to RETRACTOR, SEAT BELT, DESCRIPTION.**

1. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the screw (2) that secures the front seat belt lower anchor plate (1) to the inner floor sill near the base of the B-pillar.
3. Remove the trim panel from the lower quarter inner panel. Refer to **PANEL, QUARTER TRIM, REMOVAL** .



[**Fig. 46: Seat Belt & Screws**]
Courtesy of CHRYSLER GROUP, LLC

4. Remove the two screws (1) that secure the web guide for the seat belt (2) to the quarter inner panel just below the belt line.

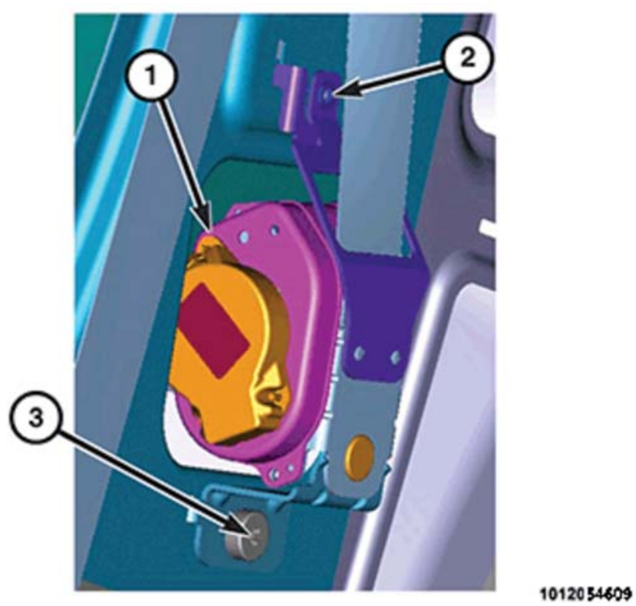


Fig. 47: Retractor & Screws
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the yellow body wire harness connector from the retractor (1) tensioner initiator.
6. Remove the screw (2) that secures the retractor upper bracket to the quarter inner panel.
7. Remove the screw (3) that secures the retractor lower bracket to the quarter inner panel.
8. Disengage the retractor by pulling the lower bracket inboard, then lifting it slightly upward to release the hooks on the upper bracket from the slots in the quarter inner panel.
9. Remove the front seat belt, retractor and web guide from the vehicle as a unit.

REAR CENTER

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler MoparÂ® Parts Catalog.**

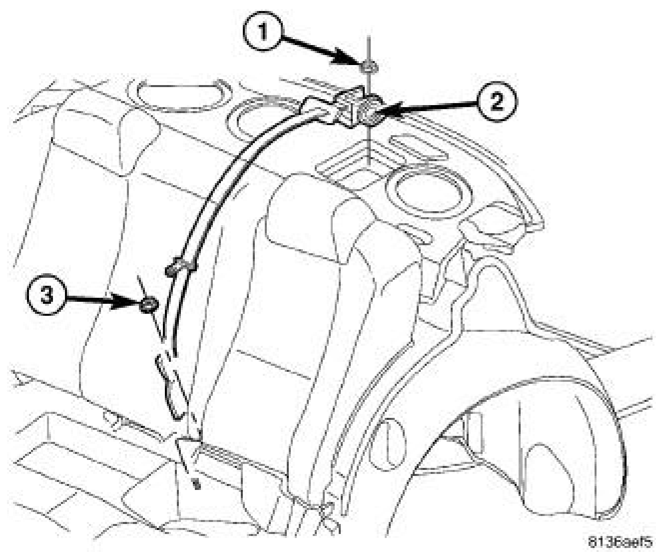

Fig. 48: Rear Center Seat Belt
Courtesy of CHRYSLER GROUP, LLC

1. Remove the rear seat cushion from the vehicle. Refer to **COVER, SEAT CUSHION, REAR, REMOVAL** .
2. Remove the nut (3) that secures the rear center seat belt lower anchor plate to the rear floor panel. The rear center seat belt lower anchor is shared with the left rear seat belt buckle unit.
3. Remove the rear center seat belt lower anchor and the left rear seat belt buckle from the mounting stud as a unit.
4. Remove the trim from the rear shelf panel support. Refer to **PANEL, REAR SHELF, REMOVAL** .
5. Remove the nut (1) that secures the rear center seat belt retractor (2) to the stud on the rear shelf panel support.
6. Remove the rear center seat belt retractor and left rear buckle unit from the vehicle as a unit.

REAR OUTBOARD

WARNING: **To avoid serious or fatal injury during and following any seat belt or child**

restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler MoparÃ® Parts Catalog.

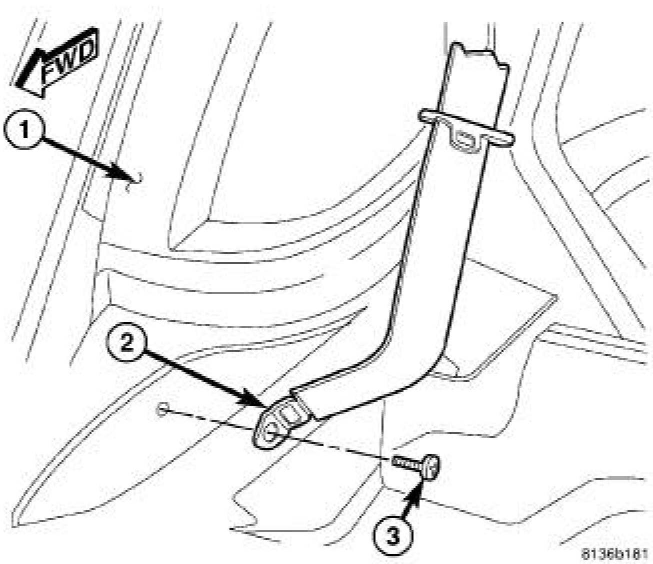

Fig. 49: Rear Seat Belt Anchor
Courtesy of CHRYSLER GROUP, LLC

1. Remove the trim panel from the upper quarter inner panel. Refer to **PANEL, QUARTER TRIM, REMOVAL** .
2. Remove the screw (3) that secures the rear outboard seat belt lower anchor (2) to the quarter inner panel just forward of the rear wheel housing (1).

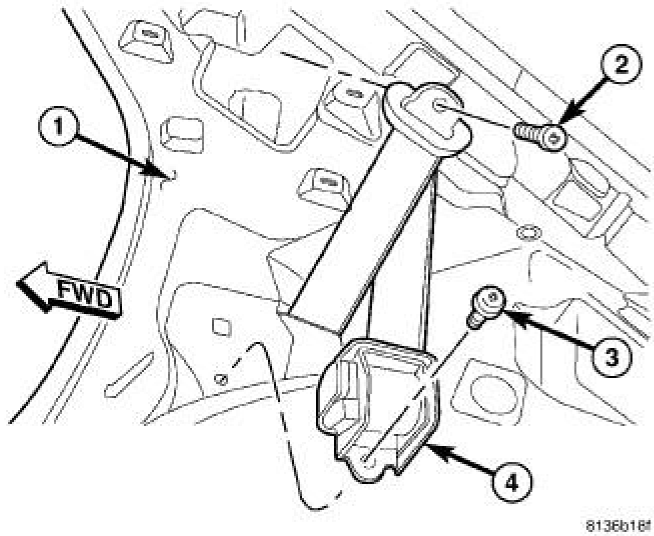

Fig. 50: Rear Seat Belt Anchor
Courtesy of CHRYSLER GROUP, LLC

3. Remove the screw (2) that secures the seat belt turning loop to the inside of the upper C-pillar.
4. Remove the seat belt turning loop from the upper inner C-pillar.
5. Remove the screw (3) that secures the retractor (4) lower bracket to the inner C-pillar.
6. Lift the retractor upward far enough to disengage the retractor upper bracket T-tab from the keyed slot in the inner C-pillar.
7. Remove the rear outboard seat belt and retractor from the vehicle as a unit.

INSTALLATION

FRONT

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace

damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler MoparĀ® Parts Catalog.

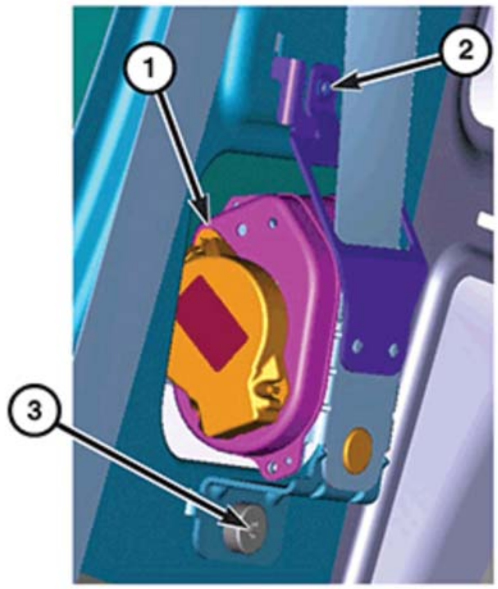

Fig. 51: Retractor & Screws
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The following procedure is for replacement of an ineffective or damaged seat belt and retractor unit. The front outboard retractors also include a seat belt tensioner. If the front seat belt or retractor is ineffective or damaged, but the seat belt tensioner is not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the seat belt tensioner has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the unit from the vehicle. Refer to STANDARD PROCEDURE.**

NOTE: **All seat belt retractors except the driver side front retractor include a switchable automatic locking mechanism. Refer to RETRACTOR, SEAT BELT, DESCRIPTION.**

1. Position the front seat belt and retractor (1) into the vehicle as a unit.
2. Engage the hooks on the retractor upper bracket into the slots in the quarter inner panel.
3. Engage the locator tab on the retractor lower bracket into the locator hole in the quarter inner panel.
4. Install and tighten the screw (3) that secures the retractor lower bracket to the quarter inner panel. Tighten the screw to **SPECIFICATIONS**.
5. Install and tighten the screw (2) that secures the retractor upper bracket to the quarter inner panel. Tighten the screw to **SPECIFICATIONS**.
6. Reconnect the yellow body wire harness connector to the retractor tensioner initiator.

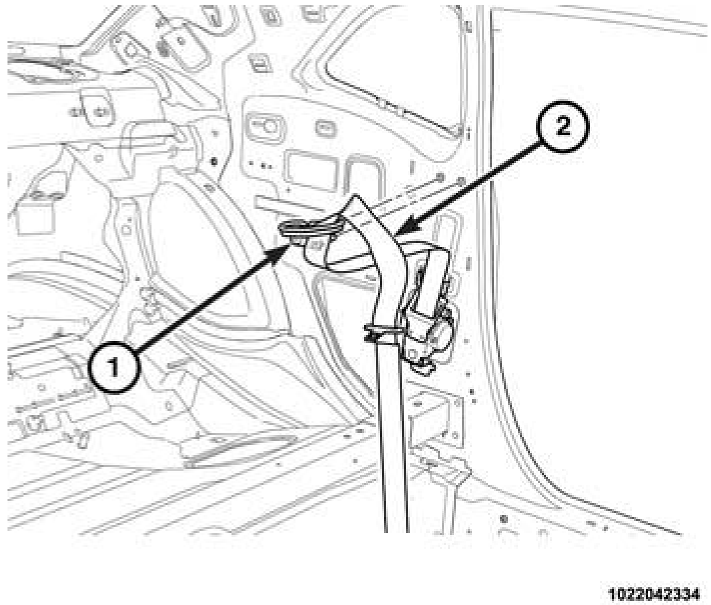

Fig. 52: Seat Belt & Screws
Courtesy of CHRYSLER GROUP, LLC

7. Position the web guide for the seat belt (2) to the quarter inner panel just below the belt line. Be certain that the belt webbing is not twisted between the retractor and the web guide.
8. Install and tighten the two screws (1) that secure the web guide to the quarter inner panel. Tighten the screws to SPECIFICATIONS.
9. Reinstall the trim panel onto the lower quarter inner panel. Refer to PANEL, QUARTER TRIM, INSTALLATION .

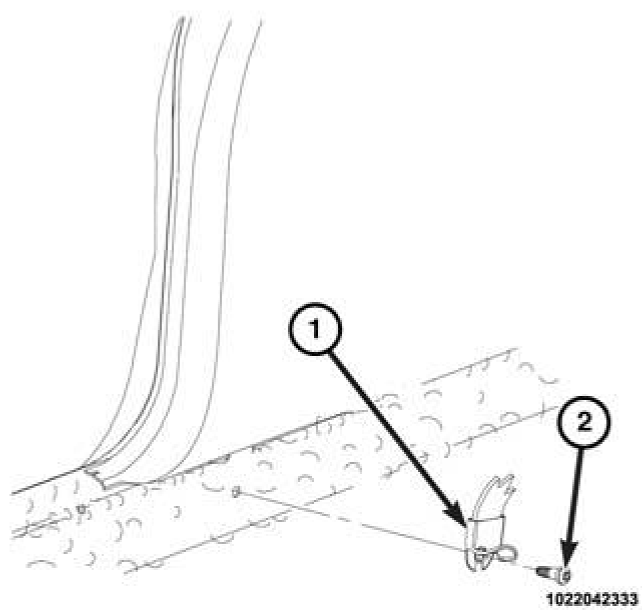

Fig. 53: Front Seat Belt Lower Anchor Plate & Screw
Courtesy of CHRYSLER GROUP, LLC

10. Position the front seat belt lower anchor plate (1) to the inner floor sill near the base of the B-pillar. Be certain that the belt webbing is not twisted between the web guide and the lower anchor plate.
11. Install and tighten the screw (2) that secures the lower anchor plate to the inner floor sill. Tighten the

screw to **SPECIFICATIONS**.

12. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

REAR CENTER

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler MoparÂ® Parts Catalog.

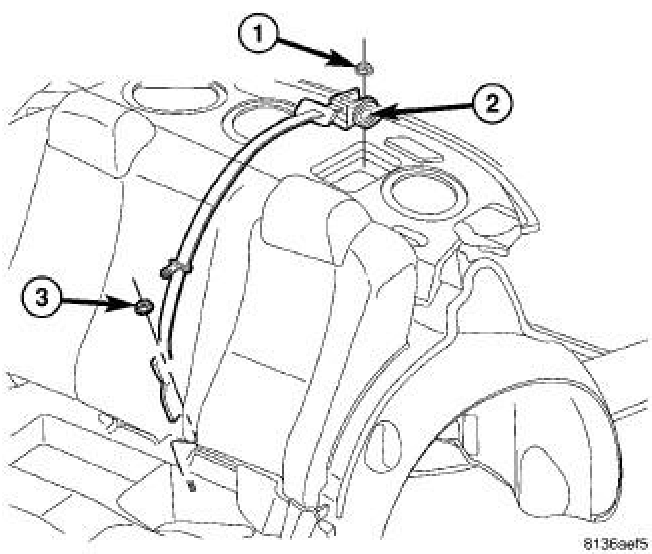

Fig. 54: Rear Center Seat Belt
Courtesy of CHRYSLER GROUP, LLC

1. Position the rear center seat belt and retractor unit (2) over the stud on the rear shelf panel support. Be certain to engage the anti-rotation tab on the retractor bracket into the clearance hole in the shelf panel support.
2. Install and tighten the nut (1) that secures the retractor to the stud on the shelf panel support. Tighten the nut to **SPECIFICATIONS**.
3. Reinstall the trim onto the rear shelf panel support. Refer to **PANEL, REAR SHELF, INSTALLATION** .
4. Position the rear center seat belt and left rear seat belt buckle unit lower anchor plate over the mounting stud on the rear floor panel. The rear center seat belt shares the lower anchor plate with the left rear seat

belt buckle. Be certain the seat belt webbing is not twisted between the retractor and the lower anchor plate.

5. Install and tighten the nut (3) that secures the rear center seat belt and buckle unit lower anchor plate to the rear floor panel. Tighten the nut to **SPECIFICATIONS**.
6. Reinstall the rear seat cushion into the vehicle. Refer to **COVER, SEAT CUSHION, REAR, INSTALLATION** .

REAR OUTBOARD

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler MoparĀ® Parts Catalog.

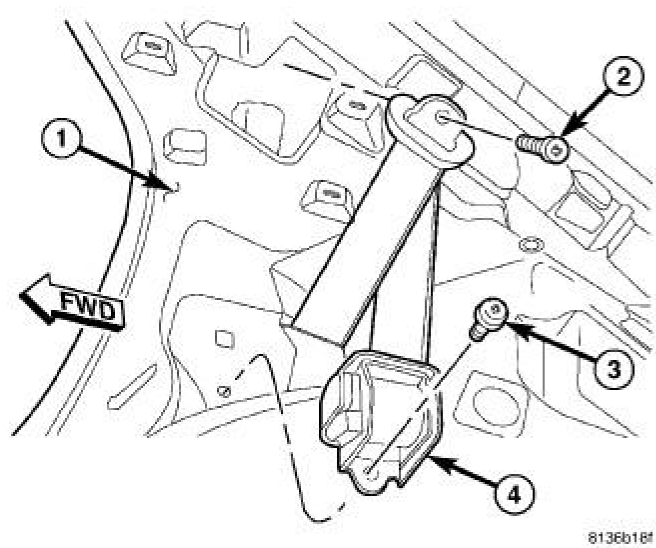

Fig. 55: Rear Seat Belt Anchor
Courtesy of CHRYSLER GROUP, LLC

1. Position the rear outboard seat belt and retractor unit (4) onto the inner C-pillar. Be certain to engage the retractor upper bracket T-tab into the keyed slot in the inner C-pillar.
2. Install and tighten the screw (3) that secures the retractor lower bracket to the inner C-pillar. Tighten the screw to **SPECIFICATIONS**.
3. Position the seat belt turning loop onto the upper inner C-pillar. Be certain the seat belt webbing is not twisted between the retractor and the turning loop.
4. Install and tighten the screw (2) that secures the seat belt turning loop to the inside of the upper C-pillar.

Tighten the screw to **SPECIFICATIONS**.

5. Reinstall the trim panel onto the upper quarter inner panel. Refer to **PANEL, QUARTER TRIM, INSTALLATION** .

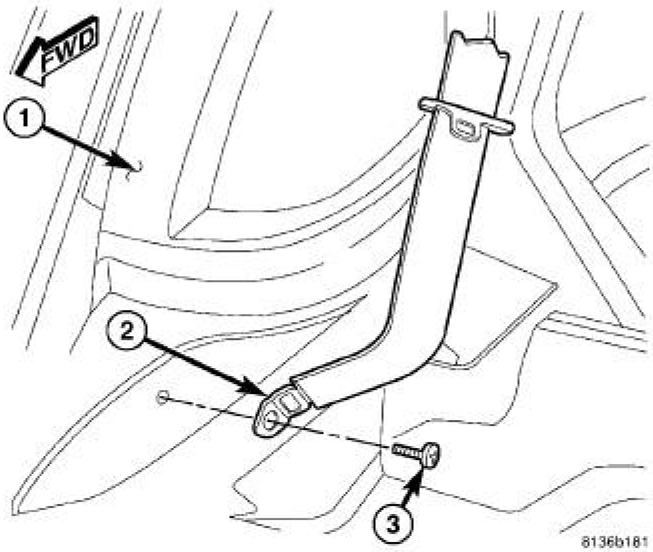

Fig. 56: Rear Seat Belt Anchor
Courtesy of CHRYSLER GROUP, LLC

6. Position the rear outboard seat belt lower anchor (2) to the quarter inner panel just forward of the rear wheel housing (1). Be certain the seat belt webbing is not twisted between the upper C-pillar and the lower anchor.
7. Install and tighten the screw (3) that secures the rear outboard seat belt lower anchor to the quarter inner panel. Tighten the screw to **SPECIFICATIONS**.

SENSOR, IMPACT

DESCRIPTION

IMPACT SENSORS

Remote or satellite impact sensors are mounted in various strategic locations of the vehicle. These sensors are mounted remotely from the impact sensor that is internal to the Occupant Restraint Controller (ORC). Sensors at the front of the vehicle provide an additional logic input for use by the Occupant Restraint Controller (ORC) to control the front airbags and the seat belt pretensioners. Sensors on each side of the vehicle provide an additional logic input for use by the ORC to control the side curtain airbags, seat airbags and the seat belt pretensioners. Two types of sensors are used in this vehicle. They are the acceleration-type and the pressure-type, which are described in further detail elsewhere within this service information.

ACCELERATION TYPE

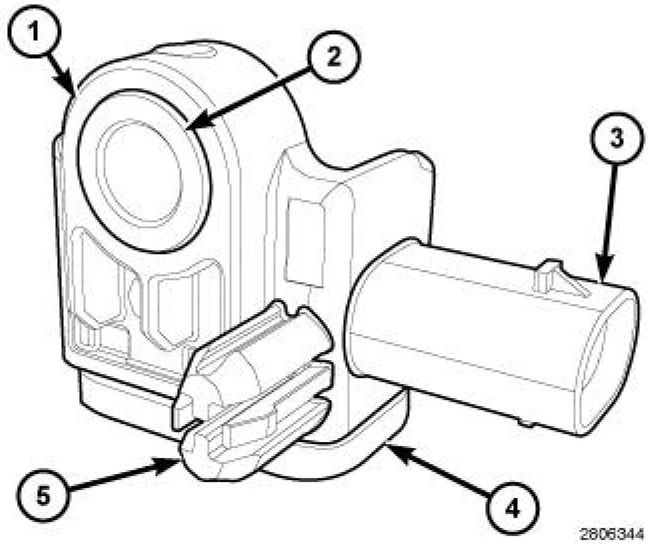

Fig. 57: Satellite Acceleration-Type Impact Sensors, Integral Connector Receptacle, Metal Sleeve & Molded Cover
Courtesy of CHRYSLER GROUP, LLC

Remote or satellite acceleration-type impact sensors (1) are mounted in various locations in the vehicle. These sensors are mounted remotely from the impact sensor that is internal to the Occupant Restraint Controller (ORC). Sensors at the front of the vehicle provide an additional logic input for use by the ORC to control the front airbags and the seat belt pretensioners. Sensors on each side of the vehicle provide an additional logic input for use by the ORC to control the side curtain airbags, the seat belt pretensioners and the seat (also known as pelvic and thorax) airbags.

Although the front and side acceleration-type impact sensors are similar in appearance and construction, they may not be interchangeable. The front impact sensors may monitor acceleration forces on a different axis than those monitored by the side impact sensors. Each sensor is secured with a single screw to its mounting location. The front sensors are located on the back of each vertical support member of the headlamp mounting cross member between the cooling module and the front lamp unit. A side sensor is located near the base of each inner B-pillar and near the belt line of each C-pillar and concealed behind the interior trim.

Each sensor housing has an integral connector receptacle (3), an integral locator pin with two latch features (5), and an integral mounting hole with a metal sleeve (2) to provide crush protection. A cavity in the center of the molded plastic impact sensor housing contains the electronic circuitry of the sensor which includes an electronic communication chip and an electronic acceleration sensor. Potting material fills the cavity and a molded cover (4) is laser welded over the cavity to seal and protect the internal electronic circuitry and components.

The front impact sensors are each connected to the vehicle electrical system through dedicated take outs and connectors of the headlamp and dash wire harness, while the side impact sensors are connected through dedicated take outs and connectors of the body wire harness.

The acceleration-type impact sensors cannot be repaired or adjusted and, if damaged or ineffective, they must be replaced.

PRESSURE TYPE

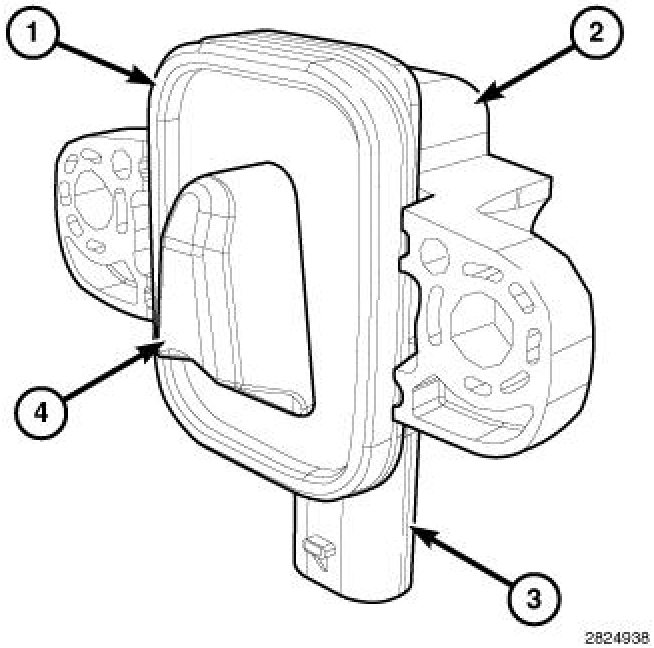

Fig. 58: Sensors, Resilient Gasket, Connector Receptacle & Water Shield
Courtesy of CHRYSLER GROUP, LLC

Two pressure-type door side impact sensors (2) are used on this vehicle, one each for the left and right sides of the vehicle. These sensors are mounted remotely from the impact sensor that is internal to the Occupant Restraint Controller (ORC). Each side sensor is secured with two screws and is sealed by a resilient gasket (1) to the door hardware module carrier on the door inner panel. The sensors are concealed behind the door trim panel within the passenger compartment.

The right and left door side impact sensors are identical in construction and calibration. The impact sensor housing has an integral connector receptacle (3), two integral mounting tabs and an integral hood-like water shield (4). The water shield extends through a hole in the door module carrier into the interior of the door cavity and protects the sensor orifice from contamination. A cavity in the center of the molded plastic impact sensor housing contains the electronic circuitry of the sensor, which includes an electronic communication chip and the pressure sensor.

The housing cavity is filled with a potting material to seal and protect the internal electronic circuitry and components. A label on the sensor has a directional arrow and the word **down** imprinted upon it to provide verification of the correct sensor orientation in the vehicle. The pressure-type side impact sensors are each connected to the vehicle electrical system through a dedicated take out and connector of the door wire harness.

These pressure-type door side impact sensors cannot be repaired or adjusted and, if damaged or ineffective, they must be replaced.

OPERATION

IMPACT SENSORS

Two types of impact sensors are used in this vehicle. They are the acceleration-type and the pressure-type. Additional operational details of each of these sensor types is described in further detail elsewhere within this service information.

ACCELERATION TYPE

The acceleration-type impact sensors are electronic accelerometers that sense the rate of vehicle deceleration, which provides verification of the direction and severity of an impact. Each sensor also contains an electronic communication chip that allows the unit to communicate the sensor status as well as sensor fault information to the microcontroller within the Occupant Restraint Controller (ORC).

The ORC microcontroller continuously monitors all of the passive restraint system electrical circuits to determine the system readiness. If the ORC detects a monitored system fault, it sets a Diagnostic Trouble Code (DTC) and controls the airbag indicator operation accordingly. The impact sensors each receive battery current and ground through dedicated left and right sensor plus and minus circuits from the ORC. The impact sensors and the ORC communicate by modulating the voltage in the sensor plus circuit.

The hard wired circuits between the impact sensors and the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the impact sensors or the electronic controls and communication between other modules and devices that provide some features of the Supplemental Restraint System (SRS). The most reliable, efficient and accurate means to diagnose the acceleration-type impact sensors or the electronic controls and communication related to impact sensor operation requires the use of a diagnostic scan tool. Refer to the appropriate Diagnostic & Testing article.

PRESSURE TYPE

The pressure-type door side impact sensors recognize a side impact in the door area by monitoring changes in pressure within the door cavity. A sudden pressure wave is created as the door collapses during an impact event. Each sensor also contains an electronic communication chip that allows the unit to communicate the sensor status as well as sensor fault information to the microcontroller within the Occupant Restraint Controller (ORC).

The ORC microcontroller continuously monitors all of the passive restraint system electrical circuits to determine the system readiness. If the ORC detects a monitored system fault, it sets a Diagnostic Trouble Code (DTC) and controls the airbag indicator operation accordingly. The impact sensors each receive battery current and ground through dedicated left and right sensor plus and minus circuits from the ORC. The impact sensors and the ORC communicate by modulating the current in the sensor plus circuit.

The hard wired circuits between the pressure-type door side impact sensors and the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the impact sensors or the electronic controls and communication between other modules and devices that provide features of the Supplemental Restraint System (SRS). The most reliable, efficient and accurate means to diagnose the pressure-type impact sensors or the electronic controls and communication related to impact sensor operation requires the use of a diagnostic scan tool. Refer to the appropriate Diagnostic & Testing article.

REMOVAL

FRONT

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge

before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the front impact sensor, as it can damage the impact sensor or affect its calibration. The front impact sensor enables the system to deploy the front Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper front SRS component deployment.

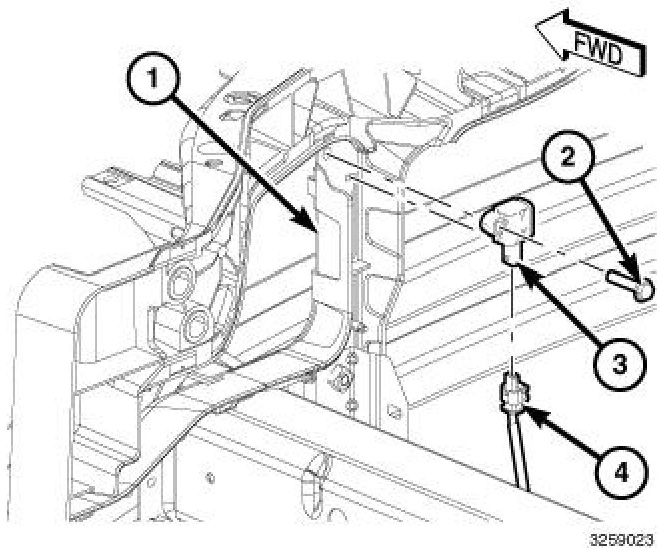

Fig. 59: Front End Module (FEM) Structural Support, Wire Harness Connector, Screw & Left Front Impact Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
2. For the left hand side only, remove the fastener that secures the engine air cleaner assembly to the Front End Module (FEM) structural support (1) and move the air cleaner assembly far enough to access the impact sensor connector and fastener on the back of the vertical support member between the cooling module and the front lamp unit opening.
3. Disconnect the headlamp and dash wire harness connector (4) from the right or left front impact sensor (3) connector receptacle.
4. Remove the screw (2) that secures the sensor to the back of the FEM vertical support member.
5. Disengage the locating pin integral to the sensor from the locating hole in the FEM vertical support member.
6. Remove the right or left front impact sensor from the vehicle.

SIDE - B-PILLAR

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

WARNING: **To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.**

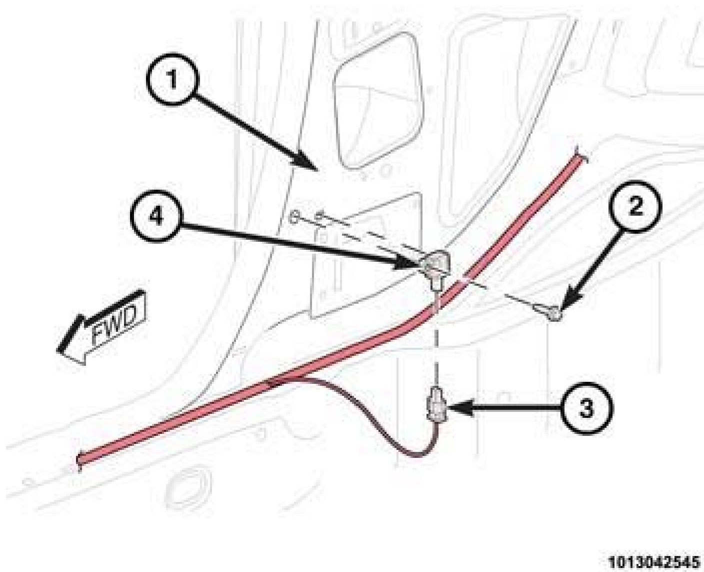

Fig. 60: Lower B-Pillar, Side Impact Connector, Wire Harness Connector & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the trim from the inside of the lower B-pillar (1). Refer to **PANEL, QUARTER TRIM, REMOVAL** .
3. Disconnect the body wire harness connector (3) from the side impact sensor (4) connector receptacle.
4. Remove the screw (2) that secures the sensor to the lower B-pillar.
5. Gently pry the sensor away from the inner B-pillar far enough to disengage the latch features of the locator pin from the locator hole.
6. Remove the sensor from the inner B-pillar.

SIDE - C-PILLAR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.

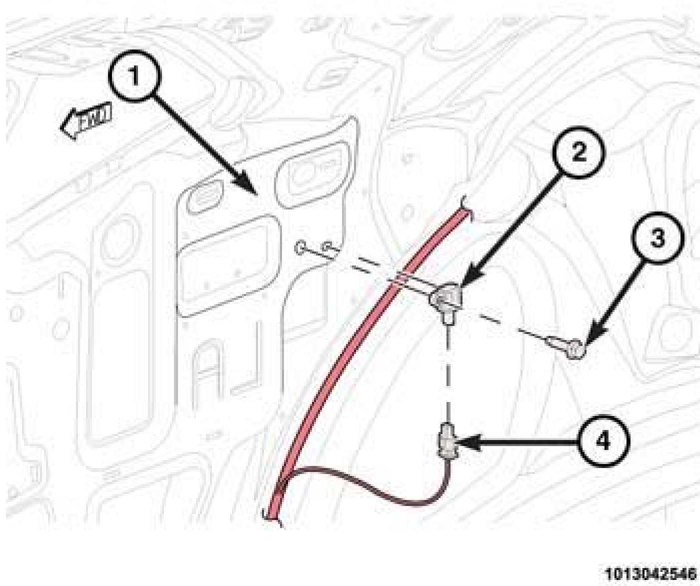

Fig. 61: C-Pillar, Wire Harness Connector, Side Impact Connector & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the trim from the inside of the C-pillar (1). Refer to **PANEL, C-PILLAR TRIM, REMOVAL** .
3. Disconnect the body wire harness connector (4) from the side impact sensor (2) connector receptacle.
4. Remove the screw (3) that secures the sensor to the inner C-pillar.
5. Gently pry the sensor away from the inner C-pillar far enough to disengage the latch features of the locator pin from the locator hole.
6. Remove the sensor from the inner C-pillar.

SIDE - DOOR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.

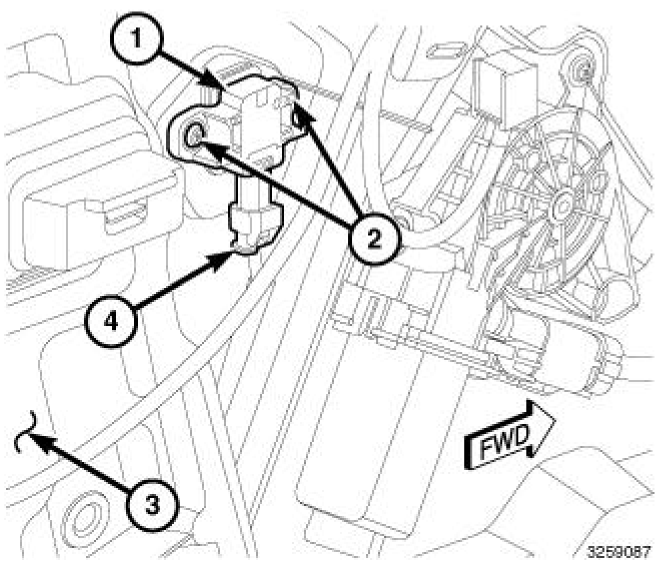

Fig. 62: Front Door Wire Harness Connector, Side Impact Sensor, Two Screws & Front Door Hardware Module Carrier Panel
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the trim panel from the inside of the right or left door. Refer to **PANEL, DOOR TRIM, REMOVAL** .
3. Disconnect the door wire harness connector (4) from the side impact sensor (1) connector receptacle.
4. Remove the two screws (2) that secure the side impact sensor to the door hardware module carrier panel (3).
5. Remove the side impact sensor from the vehicle.

INSTALLATION

FRONT

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the front impact sensor, as it can damage the impact sensor or affect its calibration. The front impact sensor enables the system to deploy the front Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper front SRS component deployment.

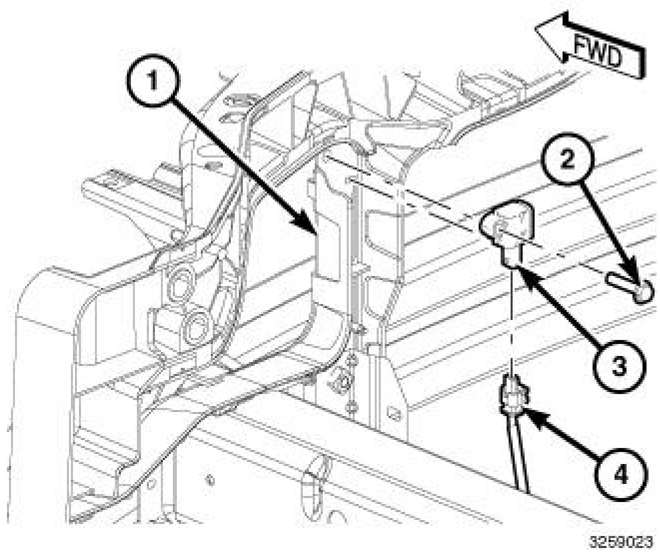

Fig. 63: Front End Module (FEM) Structural Support, Wire Harness Connector, Screw & Left Front Impact Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Position the right or left front impact sensor (3) to the back of the Front End Module (FEM) vertical support member (1) between the cooling module and the front lamp unit opening.
2. Be certain to engage the locating pin integral to the sensor into the locating hole in the FEM vertical support member.
3. Install and tighten the screw (2) that secures the sensor to the FEM vertical support member. Tighten the screw to **SPECIFICATIONS**.
4. Reconnect the headlamp and dash wire harness connector (4) to the sensor connector receptacle.
5. For the left hand side only, position the engine air cleaner assembly to the FEM structural support and

reinstall the fastener that secures the air cleaner assembly.

6. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

SIDE - B-PILLAR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.

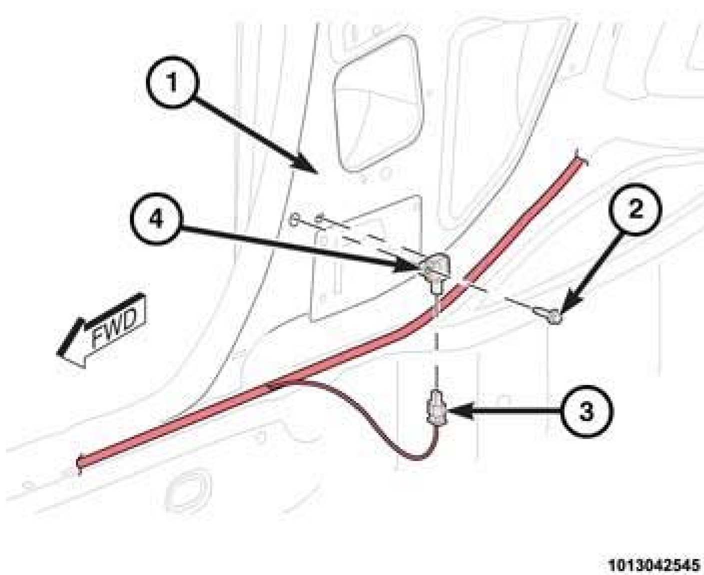

Fig. 64: Lower B-Pillar, Side Impact Connector, Wire Harness Connector & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Position the side impact sensor (4) onto the inner B-pillar (1). Be certain that the locator pin on the sensor is fully engaged in the locator hole of the inner B-pillar.
2. Install and tighten the screw (2) that secures the sensor to the inner B-pillar. Tighten the screw to **SPECIFICATIONS**.
3. Reconnect the body wire harness connector (3) to the sensor connector receptacle.

4. Reinstall the trim onto the inside of the lower B-pillar. Refer to **PANEL, QUARTER TRIM, INSTALLATION** .
5. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

SIDE - C-PILLAR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.

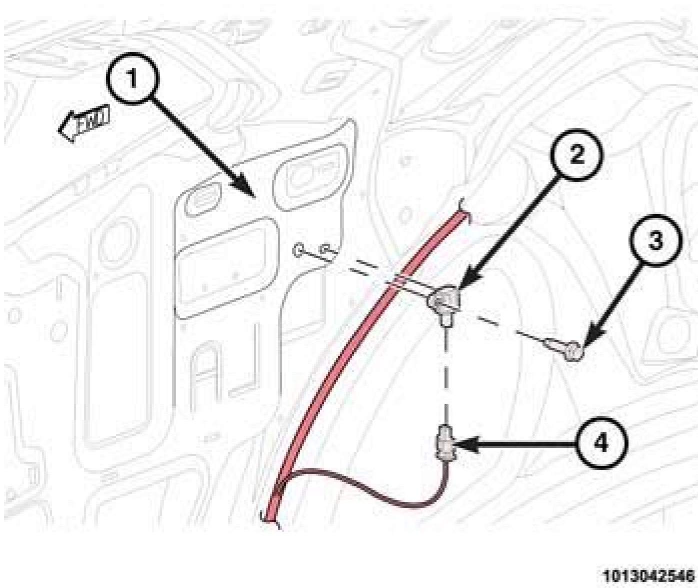

Fig. 65: C-Pillar, Wire Harness Connector, Side Impact Connector & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Position the side impact sensor (2) onto the inner C-pillar (1). Be certain that the locator pin on the sensor is fully engaged in the locator hole of the inner C-pillar.
2. Install and tighten the screw (3) that secures the sensor to the inner C-pillar. Tighten the screw to **SPECIFICATIONS**.

3. Reconnect the body wire harness connector (4) to the sensor connector receptacle.
4. Reinstall the trim onto the inside of the C-pillar. Refer to **PANEL, QUARTER TRIM, INSTALLATION** .
5. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

SIDE - DOOR

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

WARNING: **To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.**

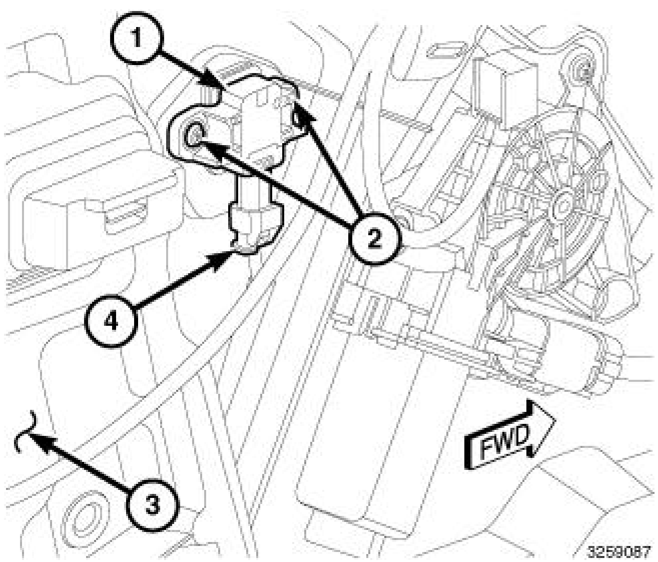

Fig. 66: Front Door Wire Harness Connector, Side Impact Sensor, Two Screws & Front Door Hardware Module Carrier Panel
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Be certain that the gasket between the pressure-type side impact sensor and the door hardware module carrier panel is in good condition and positioned on the back of the sensor. There MUST be a good seal between the sensor and the**

hardware module carrier panel for the sensor to operate properly. If the gasket is in poor condition, replace the sensor.

1. Position the side impact sensor (1) to the right or left door hardware module carrier panel (3). When the sensor is correctly positioned, the sensor connector receptacle will be pointed toward the bottom of the door.
2. Install and tighten the two screws (2) that secure the side impact sensor to the door hardware module carrier panel. Tighten the screws to **SPECIFICATIONS**.
3. Reconnect the door wire harness connector (4) to the sensor connector receptacle.
4. Reinstall the trim panel onto the inside of the right or left door. Refer to **PANEL, DOOR TRIM, INSTALLATION** .
5. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

SENSOR, OCCUPANT DETECTION

DESCRIPTION

DESCRIPTION

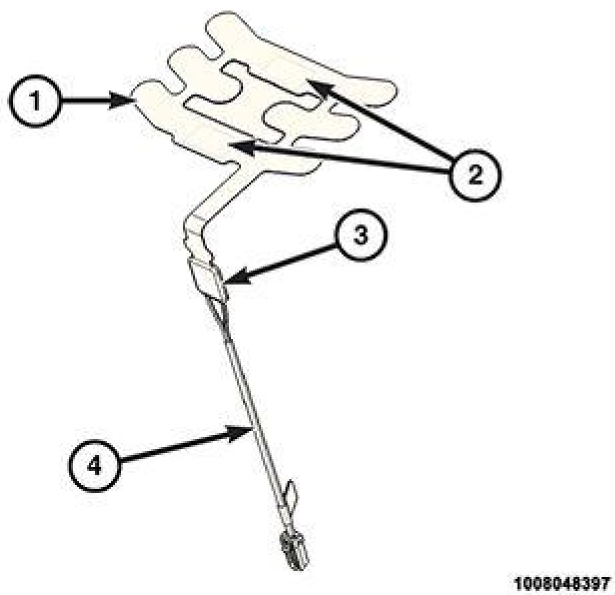

Fig. 67: Occupant Detection Sensor Components
Courtesy of CHRYSLER GROUP, LLC

An Occupant Detection Sensor (ODS) is located directly below the passenger side front seat cushion trim cover. This sensor provides information to the Occupant Restraint Controller (ORC) used for control of the passenger belt alert feature.

The ODS consists of a flexible clear plastic sensor mat (1) containing several resistive membrane, force sensing resistor cells. The sensor is secured by two adhesive patches (2) to the top surface of the seat cushion foam. If the vehicle is equipped with either heated seats or heated and ventilated seats the respective heater or heat and ventilation mat is placed over the top of the ODS mat on the seat cushion foam. The adhesive patches on the

ODS are a one time only material and cannot be reactivated or reused if removed.

A short, two-conductor pigtail wire and connector (4) connect the sensor to the vehicle electrical system through a dedicated take out and connector of the seat wire harness. A hot melt adhesive block (3) encapsulates and protects the connections between the electrical conductors in the tail of the sensor mat and the pigtail wires as well as a diagnostic resistor.

The ODS cannot be adjusted or repaired, and must be replaced if damaged or ineffective.

OPERATION

OPERATION

The Occupant Detection Sensor (ODS) acts as a simple switch to detect loads placed upon the passenger side front seat cushion. The sensor circuits are connected to and monitored by the Occupant Restraint Controller (ORC) whenever the ignition switch is in the ON position. The ORC uses an algorithm logic in monitoring the changing states of the sensor input to determine whether the seat cushion load is static or dynamic.

The ORC microcontroller continuously monitors all of the Supplemental Restraint System (SRS) electrical circuits to determine the system status and readiness. If the ORC detects a monitored system fault, it sets a Diagnostic Trouble Code (DTC). However, because the ODS input is only used for control of the passenger belt alert feature, which has no effect on SRS component features or functions, the airbag indicator is **NOT** illuminated in response to a detected ODS circuit fault.

The ODS receives source current and a clean ground through dedicated sensor plus and minus circuits from the ORC. The ORC then sends the appropriate sensor status information to the Body Control Module (BCM) (also known as the Common Body Controller/CBC), which uses this information as an additional logic input used for control of the seat belt indicator and the passenger belt alert feature in the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC).

The hard wired circuits between the ODS and the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the ODS or the electronic controls and communication between other modules and devices that provide some features of the passenger belt alert feature. The most reliable, efficient and accurate means to diagnose the ODS or the electronic controls and communication related to the passenger belt alert feature operation requires the use of a diagnostic scan tool. Refer to the appropriate Diagnostic & Testing article.

REMOVAL

WITH CLOTH SEAT TRIM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

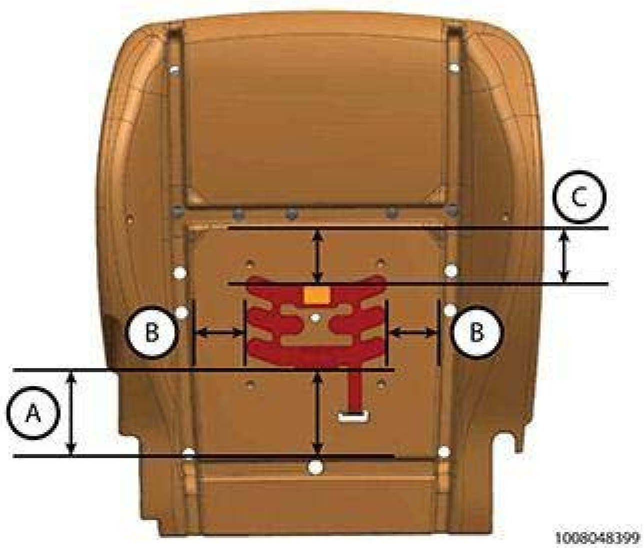

Fig. 69: Cloth - SRT
Courtesy of CHRYSLER GROUP, LLC

1. Position the passenger side front seat to its most forward position for easiest access to the front seat mounting hardware.
2. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
3. Remove the passenger side front seat from the vehicle. Refer to **SEAT, FRONT, REMOVAL** .
4. Remove the trim from the front seat cushion foam and frame. Refer to **COVER, SEAT CUSHION, FRONT, REMOVAL** .
5. If the vehicle is so equipped, remove the heater mat or heater and ventilation mat from the seat cushion foam. Refer to **PAD, HEATER, REMOVAL** .
6. Reach under the back of the front seat cushion frame to access and disconnect the Occupant Detection

Sensor (ODS) pigtail wire connector from the seat wire harness.

7. Disengage the ODS hot melt block and pigtail wire from the clearance hole near the back of the seat cushion foam.
8. Disengage the adhesive patches of the ODS from the top surface of the seat cushion foam.
9. Remove the ODS from the seat cushion.

WITH LEATHER SEAT TRIM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

1. Position the passenger side front seat to its most forward position for easiest access to the front seat mounting hardware.
2. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
3. Remove the passenger side front seat from the vehicle. Refer to **SEAT, FRONT, REMOVAL** .
4. Remove the trim from the front seat cushion foam and frame. Refer to **COVER, SEAT CUSHION, FRONT, REMOVAL** .
5. If the vehicle is so equipped, remove the heater mat or heater and ventilation mat from the seat cushion foam. Refer to **PAD, HEATER, REMOVAL** .
6. Reach under the back of the front seat cushion frame to access and disconnect the Occupant Detection Sensor (ODS) pigtail wire connector from the seat wire harness.
7. Disengage the ODS hot melt block and pigtail wire from the clearance hole near the back of the seat cushion foam.
8. Disengage the adhesive patches of the ODS from the top surface of the seat cushion foam.
9. Remove the ODS from the seat cushion.

INSTALLATION

WITH CLOTH SEAT TRIM

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

CAUTION: When handling a new Occupant Detection Sensor (ODS), it should never be bent, creased, torn, cut or abraded. The ODS should not be handled with or come into contact with hard or sharp-edged tools or objects. Do not allow the ODS to drop more than 2 meters (6.5 feet). Prior to installation, do not sit on, stand on or place boxes, tools or any other foreign object on the ODS. If the ODS adhesive patches become inadvertently adhered to any seat materials or foreign objects prior to proper positioning on the seat cushion, the ODS must be scrapped and replaced with a new unit. Do not modify the seat foam or trim materials of a seat that contains an ODS. Failure to observe these cautions may result in an inoperative ODS, or an ODS that provides inaccurate inputs to the Occupant Restraint Controller (ORC).

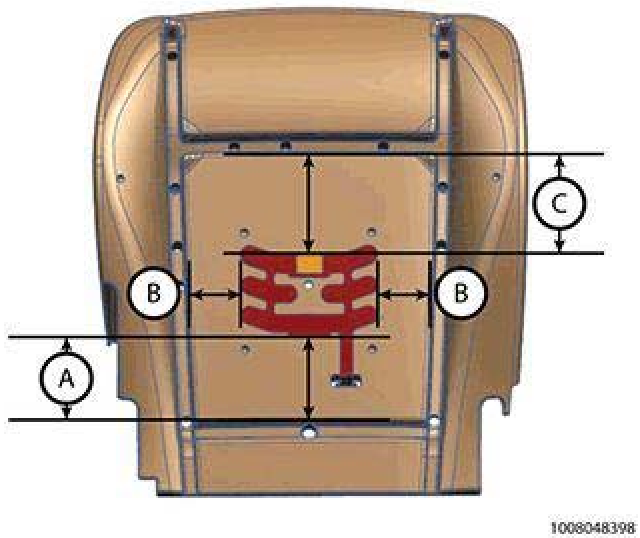

Fig. 72: Cloth - Except SRT
Courtesy of CHRYSLER GROUP, LLC

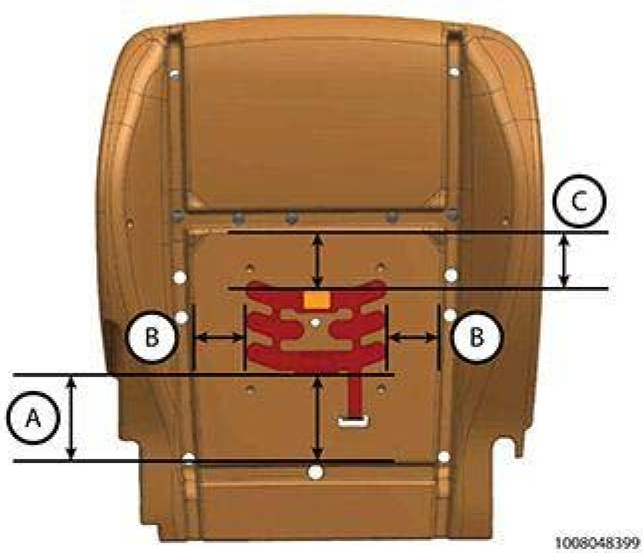

Fig. 73: Cloth - SRT
Courtesy of CHRYSLER GROUP, LLC

1. Route the Occupant Detection Sensor (ODS) pigtail wires and the hot melt block through the clearance

hole near the back of the seat cushion foam.

2. Remove the release paper from the front adhesive patch on the underside of the ODS mat.
3. Carefully position the sensor mat on the seat cushion foam with Distances A, B and C as shown in the following table before sticking the adhesive patch down onto the foam.

REFERENCE POINTS	EXCEPT SRT	SRT
Distance A - Front edge of rear crimp channel to center of rear edge of sensor mat.	100 millimeters (3.93 inches)	90 millimeters (3.54 inches)
Distance B - Inside edge of each side crimp channel to nearest edge of sensor mat.	62 millimeters (2.44 inches)	62 millimeters (2.44 inches)
Distance C - Rear edge of front crimp channel to center of front edge of sensor mat.	120 millimeters (4.72 inches)	75 millimeters (2.95 inches)

CAUTION: The adhesive used to secure the ODS to the seat is heat activated and requires that both the adhesive and the material it is applied to be ideally between 21Ā° and 38Ā° C (between 70Ā° and 100Ā° F). Application of the ODS to surfaces below 10Ā° C (50Ā° F) is not recommended as the adhesive becomes too firm to readily adhere. Do not touch or allow the adhesive patches to contact any foreign materials with the release paper removed. Do not attempt to add adhesive materials to the ODS.

4. Peel the release paper off of the rear adhesive patch on the underside of the ODS mat.
5. One at a time, apply hand pressure (0.8 bar or 12 psi) over each of the adhesive patches of the ODS mat for at least four seconds to activate and adhere the adhesive to the seat cushion foam.
6. Confirm the ODS mat is properly positioned on the seat cushion foam.
7. Reach under the back of the front seat cushion frame to access, route and reconnect the ODS pigtail wire and connector to the seat wire harness.
8. If the vehicle is so equipped, reinstall the heater mat or the heater and ventilation mat onto the seat cushion foam. Refer to PAD, HEATER, INSTALLATION .
9. Reinstall the trim onto the front seat cushion. Refer to COVER, SEAT CUSHION, FRONT, INSTALLATION .
10. Reinstall the passenger side front seat into the vehicle. Refer to SEAT, FRONT, INSTALLATION .
11. Reconnect the negative cable to the battery. If equipped with an Intelligent Battery Sensor (IBS), reconnect the IBS connector.

WITH LEATHER SEAT TRIM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to

disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

CAUTION: When handling a new Occupant Detection Sensor (ODS), it should never be bent, creased, torn, cut or abraded. The ODS should not be handled with or come into contact with hard or sharp-edged tools or objects. Do not allow the ODS to drop more than 2 meters (6.5 feet). Prior to installation, do not sit on, stand on or place boxes, tools or any other foreign object on the ODS. If the ODS adhesive patches become inadvertently adhered to any seat materials or foreign objects prior to proper positioning on the seat cushion, the ODS must be scrapped and replaced with a new unit. Do not modify the seat foam or trim materials of a seat that contains an ODS. Failure to observe these cautions may result in an inoperative ODS, or an ODS that provides inaccurate inputs to the Occupant Restraint Controller (ORC).

1. Route the Occupant Detection Sensor (ODS) pigtail wires and the hot melt block through the clearance hole near the back of the seat cushion foam.
2. Remove the release paper from the front adhesive patch on the underside of the ODS mat.
3. Carefully position the sensor mat on the seat cushion foam with Distances A, B and C as shown in the following table before sticking the adhesive patch down onto the foam.

REFERENCE POINTS	EXCEPT SRT	SRT
Distance A - Front edge of rear crimp channel to center of rear edge of sensor mat.	95 millimeters (3.74 inches)	94 millimeters (3.70 inches)
Distance B - Inside edge of each side crimp channel to nearest edge of sensor mat.	63 millimeters (2.48 inches)	63 millimeters (2.48 inches)
Distance C - Rear edge of front crimp channel to center of front edge of sensor mat.	115 millimeters (4.52 inches)	70 millimeters (2.75 inches)

CAUTION: The adhesive used to secure the ODS to the seat is heat activated and requires that both the adhesive and the material it is applied to be ideally between 21Ā° and 38Ā° C (between 70Ā° and 100Ā° F). Application of the ODS to surfaces below 10Ā° C (50Ā° F) is not recommended as the adhesive becomes too firm to readily adhere. Do not touch or allow the adhesive patches to contact any foreign materials with the release paper removed. Do not attempt to add adhesive materials to the ODS.

4. Peel the release paper off of the rear adhesive patch on the underside of the ODS mat.
5. One at a time, apply hand pressure (0.8 bar or 12 psi) over each of the adhesive patches of the ODS mat for at least four seconds to activate and adhere the adhesive to the seat cushion foam.
6. Reach under the back of the front seat cushion frame to access, route and reconnect the ODS pigtail wire and connector to the seat wire harness.
7. If the vehicle is so equipped, reinstall the heater mat or the heater and ventilation mat onto the seat

cushion foam. Refer to **PAD, HEATER, INSTALLATION** .

8. Reinstall the trim onto the front seat cushion. Refer to **COVER, SEAT CUSHION, FRONT, INSTALLATION** .
9. Reinstall the passenger side front seat into the vehicle. Refer to **SEAT, FRONT, INSTALLATION** .
10. Reconnect the negative cable to the battery. If equipped with an Intelligent Battery Sensor (IBS), reconnect the IBS connector.

SENSOR, SEAT TRACK POSITION

DESCRIPTION

DESCRIPTION

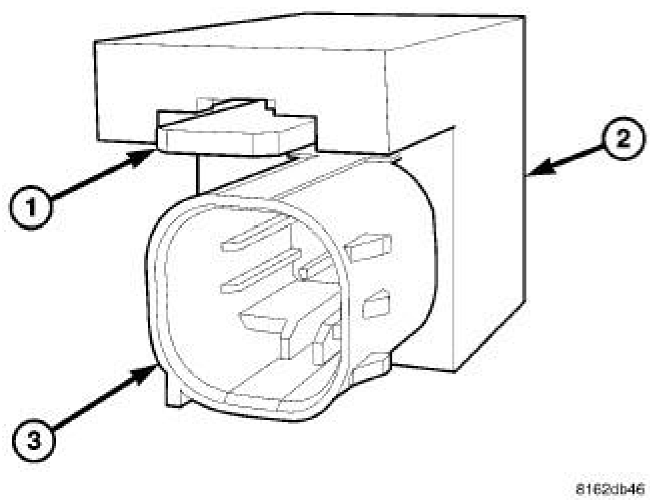

Fig. 74: Identifying Seat Track Position Sensor
Courtesy of CHRYSLER GROUP, LLC

The Seat Track Position Sensor (STPS) (2) is a Hall Effect-type sensor used on some vehicles. This sensor consists of a Hall Effect Integrated Circuit (IC) chip encased in potting material within a cavity of the molded plastic sensor housing.

The STPS housing has a mounting slot containing an integral latch feature (1) and slides and latches onto a stamped metal blade-type bracket located on the inboard side of one of the upper seat adjuster tracks near the rear of the driver side or passenger side front seat. A molded connector receptacle (3) integral to the STPS housing is connected to the vehicle electrical system through a connector and take out of the front seat wire harness beneath the front seat cushion frame.

The STPS cannot be adjusted or repaired and, if ineffective or damaged, the entire STPS unit must be replaced.

OPERATION

OPERATION

The Seat Track Position Sensor (STPS) is designed to provide a seat position data input to the Occupant

Restraint Controller (ORC) indicating whether the driver or passenger side front seat is in a full forward or a not full forward position. The ORC uses this data as an additional logic input for use in determining the appropriate deployment force to be used when deploying the multistage Driver AirBag (DAB) or Passenger AirBag (PAB).

The STPS receives a nominal five volt supply from the ORC. The STPS communicates the seat position by modulating the voltage returned to the ORC on a sensor data circuit. The ORC also monitors the condition of the STPS circuits and will store a Diagnostic Trouble Code (DTC) for any fault that is detected. The ORC sends messages over the CAN data bus to control the illumination of the airbag indicator in the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC).

The hard wired circuits between the STPS and the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the STPS or the electronic controls and communication between other modules and devices that provide features of the Supplemental Restraint System (SRS). The most reliable, efficient and accurate means to diagnose the STPS or the electronic controls and communication related to STPS operation requires the use of a diagnostic scan tool. Refer to the appropriate Diagnostic & Testing article.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

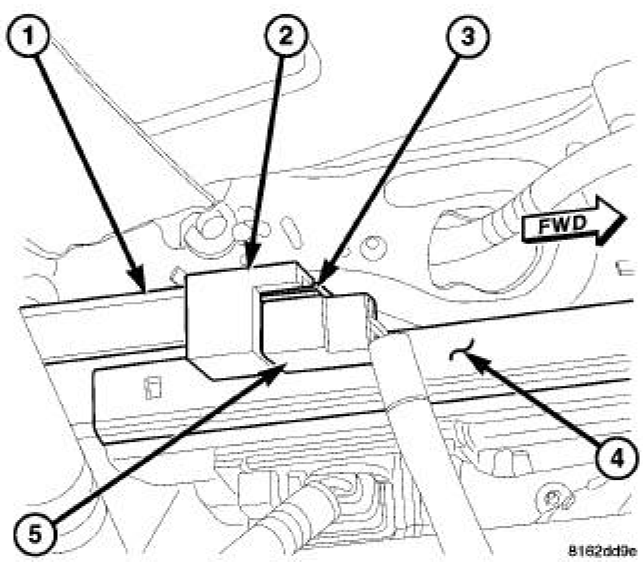

Fig. 75: Seat Track Position Sensor, Bracket, Upper Inboard Seat Track & Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
2. Reach under the rear edge of the front seat cushion to access the Seat Track Position Sensor (STPS) (2) on a bracket (1) located on the inboard side near the rear of one of the upper seat tracks (4).
3. Using a small screwdriver, hold the latch feature (3) depressed while sliding the connector end of the STPS off of the bracket.
4. Disconnect the seat wire harness connector (5) from the STPS connector receptacle.
5. Remove the STPS from under the front seat.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

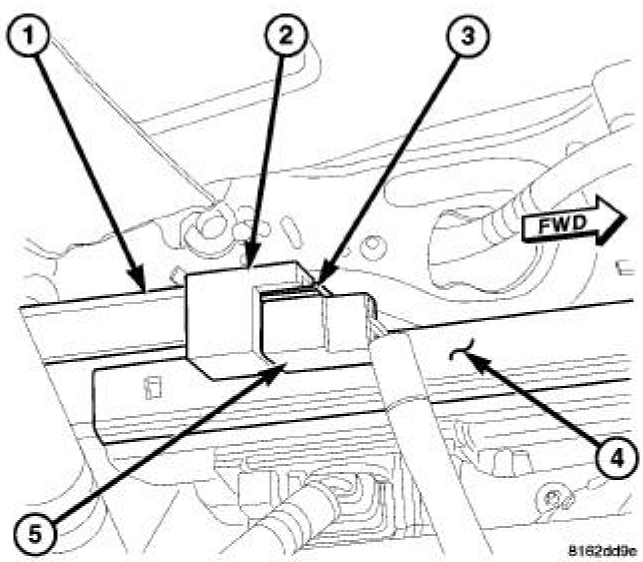

Fig. 76: Seat Track Position Sensor, Bracket, Upper Inboard Seat Track & Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Reach under the rear edge of the front seat cushion to reconnect the seat wire harness connector (5) to the Seat Track Position Sensor (STPS) (2) connector receptacle. Be certain that the latch on the connector is fully engaged.
2. Align the open end of the STPS mounting slot to the blade of the STPS bracket (1) located on the inboard side near the rear of one of the upper seat tracks (4).
3. Push the STPS firmly onto the bracket until the latch feature (3) snaps into place with an audible click.

4. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

SWITCH, SEAT BELT

DESCRIPTION

DESCRIPTION

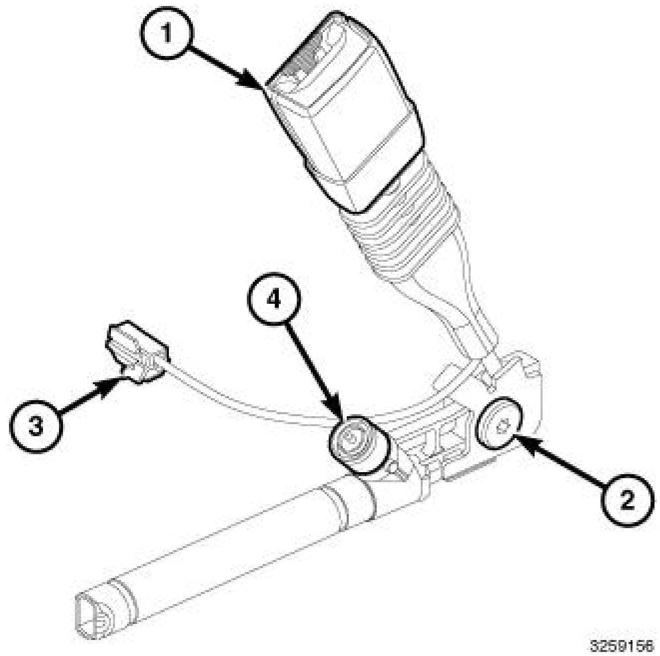

Fig. 77: Seat Belt Tensioner Initiator, Buckle And Tensioner, Switch Pigtail Wire Connector & Screw
Courtesy of CHRYSLER GROUP, LLC

The driver and passenger side front seat belt switches for this vehicle are actually Hall Effect-type sensors. These sensors consist of a fixed-position, Hall Effect Integrated Circuit (IC) chip and a small permanent magnet that is integral to each front seat belt buckle (1). The front seat belt buckles are located on a molded plastic scabbard and secured by a screw (2) to the inboard side of each front seat cushion frame so that the buckles travel with the seat.

The front seat belt switches are connected to the vehicle electrical system through a two-lead pigtail wire and connector (3) on the front seat belt buckle-half, which is connected to a wire harness connector and take out of the seat wire harness. A one kilohm diagnostic resistor is connected in parallel with the IC where the two pigtail wire leads connect to the IC pins.

The seat belt switches cannot be adjusted or repaired and, if ineffective or damaged, the entire front seat belt buckle-half unit must be replaced.

OPERATION

OPERATION

The front seat belt switches are designed to control a hard wired sense input to the Occupant Restraint Controller (ORC). A spring-loaded slide with a small window-like opening is integral to the buckle latch

mechanism. When a seat belt tip-half is inserted and latched into the seat belt buckle, the slide is pushed downward and the window of the slide exposes the Hall Effect Integrated Circuit (IC) chip within the buckle. The field of the permanent magnet induces a current within the chip. The chip provides this induced current as an output to the ORC. When the seat belt is unbuckled, the spring-loaded slide moves upward and shields the IC from the field of the permanent magnet, causing the output current from the seat belt switch to be reduced.

The seat belt switches receive a supply of current from the ORC, and the ORC senses the status of the front seat belt switches through its connection to the seat wire harness. The ORC provides electronic **seat belt switch status** messages to the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) over the Controller Area Network (CAN) data bus. The IC uses these messages as an additional logic input for control of the seat belt indicator. The ORC monitors the condition of the seat belt switch circuits and will store a Diagnostic Trouble Code (DTC) for any fault that is detected.

The hard wired circuits between the seat belt switches and the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the switches or the electronic controls and communication between other modules and devices that provide some features of the seat belt reminder system. The most reliable, efficient and accurate means to diagnose the seat belt switches or the electronic controls and communication related to seat belt switch operation requires the use of a diagnostic scan tool. Refer to the appropriate Diagnostic & Testing article.

TENSIONER, SEAT BELT

DESCRIPTION

SEAT BELT TENSIONERS

In vehicles manufactured for domestic markets, the front seat belt incorporates dual tensioners: one integral to the retractor, and one integral to the buckle. In vehicles manufactured for export markets, only the retractor tensioner is used. Each of these tensioner types is described in further detail elsewhere within this service information.

BUCKLE TENSIONER

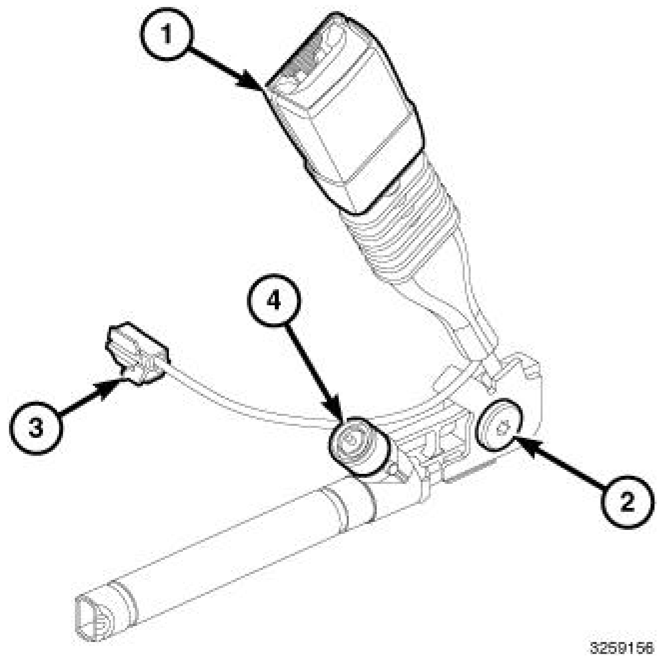

Fig. 78: Seat Belt Tensioner Initiator, Buckle And Tensioner, Switch Pigtail Wire Connector & Screw
Courtesy of CHRYSLER GROUP, LLC

A seat belt buckle tensioner supplements the dual front airbags for domestic market versions of this vehicle. This tensioner is integral to the front seat belt buckle unit, which is secured by a large screw to the outside of the inboard seat cushion frame of the front seat. The buckle tensioner consists primarily of a buckle (1), a molded plastic scabbard, a cable and piston, a cable guide and bracket, a metal cylinder tube and a small pyrotechnically activated gas generator (4).

The buckle tensioner is controlled by the Occupant Restraint Controller (ORC) and is connected to the vehicle electrical system through a dedicated take out of the seat wire harness by a keyed and latching yellow molded plastic connector insulator to ensure a secure connection. The buckle tensioner has a single pigtail harness (3) for the integral seat belt switch.

The buckle tensioner cannot be repaired and, if ineffective or damaged, the entire front seat belt buckle unit must be replaced. If the front airbags have been deployed, the buckle tensioners have also been deployed. The buckle tensioners are not intended for reuse and must be replaced following any front airbag deployment. Refer to **BUCKLE, SEAT BELT, REMOVAL**.

RETRACTOR TENSIONER

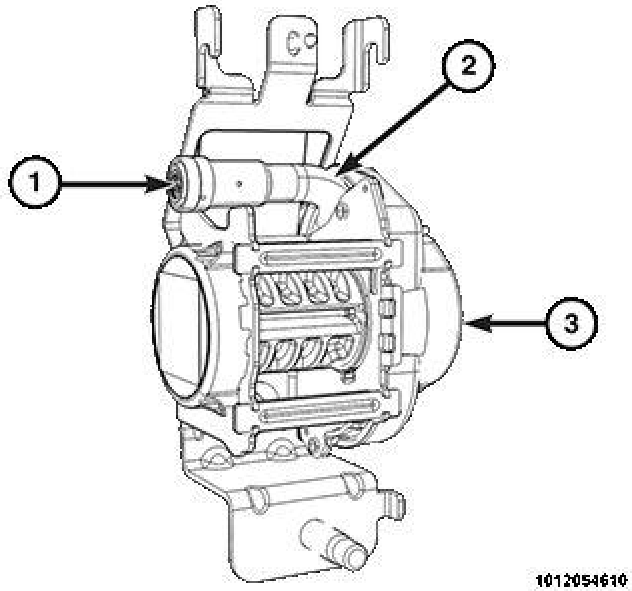

Fig. 79: Seat Belt Retractor Tensioner
Courtesy of CHRYSLER GROUP, LLC

Seat belt retractor tensioners supplement the dual front airbag system for all versions of this vehicle. These tensioners are integral to the front seat belt and retractor units (3), which are secured to the inner quarter panel on the right and left sides of the vehicle. The retractor is concealed beneath the molded plastic inner quarter panel trim. The seat belt tensioner consists primarily of a sprocket/pinion, a steel tube (2), a cast metal housing, numerous steel balls, a torsion bar and a small pyrotechnically activated Micro Gas Generator (MGG) with a connector receptacle (1).

All of these components are located on one side of the retractor spool on the outside of the retractor housing except for the torsion bar, which serves as the spindle upon which the retractor spool rides. The seat belt tensioners are controlled by the Occupant Restraint Controller (ORC) and are connected to the vehicle electrical system through a dedicated take outs of the body wire harness by keyed and latching yellow molded plastic connector insulator to ensure a secure connection.

The retractor tensioners cannot be repaired and, if ineffective or damaged, the entire front seat belt and retractor unit must be replaced. If the front airbags have been deployed, the seat belt tensioners have also been deployed. The seat belt tensioners are not intended for reuse and must be replaced following any front airbag deployment. A growling or grinding sound while attempting to operate the seat belt retractor is a sure indication that the seat belt tensioner has been deployed and requires replacement. Refer to **RETRACTOR, SEAT BELT, REMOVAL**.

OPERATION

OPERATION

The seat belt tensioners are deployed in conjunction with the dual front airbags by a signal generated by the Occupant Restraint Controller (ORC) through the driver or passenger seat belt tensioner line 1 and line 2 (or squib) circuits. When the ORC sends the proper electrical signal to the tensioners, the electrical energy generates enough heat to initiate a small pyrotechnic gas generator.

On the retractor tensioner, the gas generator is installed in one end of a steel tube that contains numerous steel

balls. As the gas expands, it pushes the steel balls through the tube into a cast metal housing, where a ball guide directs the balls into engagement with the teeth of a sprocket that is geared to one end of the retractor spool. As the balls drive past the sprocket, the sprocket turns and drives the seat belt retractor spool causing the slack to be removed from the front seat belts. The ball trap captures the balls as they leave the sprocket and are expelled from the housing.

On the buckle tensioner, the gas generator is installed in one end of the tubular metal piston housing, which contains a piston secured to one end of a cable. The cable is routed around an integral guide to the buckle, which is secured to the opposite end of the cable. As the gas expands, it pushes the piston and the cable through the tube and pulls the buckle downward, causing the slack to be removed from the front seat belt.

Removing excess slack from the front seat belts not only keeps the occupants properly positioned for an airbag deployment following a frontal impact of the vehicle, but also helps to reduce injuries that the occupants of the front seats might experience in these situations as a result of harmful contact with the steering wheel, steering column, instrument panel or windshield. The seat belt retractor also has a torsion bar mechanism that is designed to deform in order to control the loading being applied to the occupants by the seat belts during a frontal impact, further reducing the potential for occupant injuries.

The ORC monitors the condition of the seat belt tensioners through circuit resistance. If any fault is detected the ORC will illuminate the airbag indicator in the instrument cluster and store a Diagnostic Trouble Code (DTC). Proper diagnosis of the seat belt tensioner gas generator and squib circuits requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate Diagnostic & Testing article.

2015-16 ACCESSORIES AND EQUIPMENT

Speed Control - Service Information - Challenger

DESCRIPTION

DESCRIPTION

Two electronic speed control systems are available factory-installed equipment on this vehicle: a conventional system and an adaptive system. Additional details of these two systems and their components can be found under the subheadings and paragraphs that follow.

CONVENTIONAL SPEED CONTROL

The conventional electronic speed control system includes the following major components, which are described in further detail elsewhere in this service information:

- **Antilock Brake System Module** - An Antilock Brake System (ABS) module is located below the antilock brake Hydraulic Control Unit (HCU) in the engine compartment. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, DESCRIPTION** .
- **Brake Lamp Sensor** - The brake (also known as stop) lamp switch in this vehicle is actually a brake pedal position sensor. This sensor is located on the brake pedal support bracket under the driver side of the instrument panel. Refer to **DESCRIPTION** .
- **Instrument Panel Cluster** - An indicator located in the Instrument Panel Cluster (IPC) displays "CRUISE" to inform the vehicle operator when the speed control system is turned ON. Refer to **DESCRIPTION** .
- **Powertrain Control Module** - The Powertrain Control Module (PCM) is located in the engine compartment. The PCM contains the software and hardware that monitors all BUSSED and hardwired inputs related to the speed control system. Along with monitoring the inputs the PCM controls all of the speed control system outputs. Refer to **MODULE, POWERTRAIN CONTROL, DESCRIPTION** .
- **Speed Control Switches** - A speed control switch pod containing five momentary switch push buttons is located in the right horizontal spoke of the steering wheel. The switches communicate over the LIN bus system.
- **Steering Column Control Module** - A Steering Column Control Module microcontroller is internal to the SCCM located at the top of the steering column just below the steering wheel. Refer to **MODULE, STEERING COLUMN CONTROL, DESCRIPTION** .
- **Wheel Speed Sensors** - A wheel speed sensor is located on the knuckle of each front and rear wheel. Refer to **SENSOR, WHEEL SPEED, FRONT, DESCRIPTION** .

The ABS, the IPC, the PCM and the SCCM each contain a microcontroller and programming that allow them to communicate with each other using the Controller Area Network (CAN) data bus. This method of communication is used by the SCCM microcontroller to relay the status of the speed control switches over a dedicated LIN bus to the PCM, and by the PCM for control of the CRUISE indicator in the IC. Refer to **COMMUNICATION, DESCRIPTION** .

Hard wired circuitry connects the conventional electronic speed control system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed

throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the speed control system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

ADAPTIVE SPEED CONTROL

The adaptive electronic speed control system includes the following major components, which are described in further detail elsewhere in this service information:

- **Adaptive Cruise Control (ACC) Module** - An ACC module and the radar sensor or module) is located on a bracket secured near the right outboard end of the front bumper support member of the Front End Module (FEM) behind the front fascia. Refer to **MODULE, ADAPTIVE CRUISE CONTROL, DESCRIPTION** .
- **Antilock Brake System Module** - An Antilock Brake System (ABS) module is located below the antilock brake Hydraulic Control Unit (HCU) in the engine compartment. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, DESCRIPTION** .
- **Brake Lamp Switch** - The brake (also known as stop) lamp sensor in this vehicle is actually a brake pedal position sensor. This sensor is located on the brake pedal support bracket under the driver side of the instrument panel. Refer to **DESCRIPTION** .
- **Instrument Panel Cluster** - An indicator located in the Instrument Panel Cluster (IPC) displays "CRUISE" to inform the vehicle operator when the speed control system is turned ON. Refer to **DESCRIPTION** .
- **Electronic Vehicle Information Center** - The Electronic Vehicle Information Center (EVIC) is located in the Integrated Center Stack (ICS) and provides an interface to the vehicle operator for setting the adaptive speed control customer preferences as well as a display of the adaptive speed control and Forward Collision Warning (FCW) system status messages. Refer to **CENTER, ELECTRONIC VEHICLE INFORMATION, DESCRIPTION** .
- **Powertrain Control Module** - The Powertrain Control Module (PCM) is located in the engine compartment. The PCM contains the software and hardware that monitors all of the speed control system inputs and controls all of the speed control system outputs. Refer to **MODULE, POWERTRAIN CONTROL, DESCRIPTION** .
- **Speed Control Switches** - A speed control switch pod containing eight momentary switch push buttons is located in the right horizontal spoke of the steering wheel.
- **Steering Column Control Module** - A microcontroller is integral to the Steering Column Control Module (SCCM) located at the top of the steering column just below the steering wheel. Refer to **MODULE, STEERING COLUMN CONTROL, DESCRIPTION** .
- **Wheel Speed Sensors** - A wheel speed sensor is located on the knuckle of each front and rear wheel. Refer to **SENSOR, WHEEL SPEED, FRONT, DESCRIPTION** .

The ACC sensor, the ABS, the IPC, the EVIC, the PCM and the SCCM each contain a microcontroller and programming that allow them to communicate with each other using the Controller Area Network (CAN) data bus. This method of communication is used by the ACC sensor to provide inputs to the ABM, the EVIC and the PCM, is used by the ABM to provide inputs to the PCM, is used by the SCCM to relay the status of the speed

control switches to the PCM and is used by the PCM for control of the indicators in the IC and the indications in the EVIC. Refer to **COMMUNICATION, DESCRIPTION** .

Hard wired circuitry connects the adaptive electronic speed control system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the speed control system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OPERATION

CONVENTIONAL SPEED CONTROL

The vehicle operator controls all conventional speed control system features through the speed control switch pod on the face of the right horizontal spoke of the steering wheel. The Steering Column Control Module (SCCM) reads the speed control switch input via LIN bus. The SCCM relays an electronic speed control switch status message to the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus (CAN-C). The PCM software continually monitors these inputs as well as electronic vehicle distance message inputs from the Antilock Brake System Module (ABS) and numerous hard wired inputs including the brake (stop) lamp sensor, then provides the appropriate electronic message and hard wired outputs to invoke the requested electronic speed control features. The PCM manages the Cruise Control algorithm to maintain vehicle speed established by the driver. It is also the responsibility of the PCM to send out cruise control override information and perform stuck button diagnostics.

The PCM microcontroller continuously monitors all of the speed control system electrical circuits to determine the system readiness. If the PCM detects a monitored system fault, it sets and stores a Diagnostic Trouble Code (DTC). The PCM uses On-Board Diagnostics (OBD) and can communicate with other electronic modules in the vehicle as well as with the diagnostic scan tool using the CAN data bus. This method of communication is used for control of the Malfunction Indicator Lamp (MIL) (also known as the Check Engine lamp) in the Instrument Cluster (IC) and for system diagnosis and testing through the 16-way data link connector located on the driver side lower edge of the instrument panel.

The hard wired inputs and outputs for the PCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the PCM or the electronic controls or communication between other modules and devices that provide features of the conventional speed control system. The most reliable, efficient, and accurate means to diagnose the PCM or the electronic controls and communication related to speed control system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

ADAPTIVE SPEED CONTROL

The vehicle operator controls all Adaptive Speed Control (ACC) system features through the speed control switch pod on the face of the right horizontal spoke of the steering wheel. When a push button of the switch pod is depressed, it provides a LIN switch input to the Steering Column Control Module (SCCM).

The SCCM reads the speed control switch input, then relays an electronic speed control switch status message to the Powertrain Control Module (PCM) and to the ACC module over the Controller Area Network (CAN) data bus. The PCM and ACC module continually monitor these inputs as well as electronic wheel speed message inputs from the Antilock Brake System Module (ABS), electronic gear selector message inputs from the Transmission Control Module (TCM), and numerous hard wired inputs including the brake (stop) lamp sensor, then provides the appropriate electronic message and hard wired outputs to invoke the requested electronic speed control features.

Using the MODE push button of the speed control switch pod on the face of the right horizontal spoke of the steering wheel, the vehicle operator can choose between adaptive speed control and conventional speed control modes of operation. As the name implies, when in the conventional speed control mode the speed control system is used and functions exactly like a conventional speed control system. When in the adaptive speed control mode, the vehicle operator can use the DISTANCE increase or decrease push buttons of the speed control switch pod to select from one of three distance settings for the adaptive cruise system to maintain. These settings equate to the time in seconds separating the vehicle from a preceding vehicle. The ACC module sends electronic message outputs to the ABS, the TCM and the PCM to maintain the selected separation distance. The available distance settings are:

- **1** - 1.0 second
- **2** - 1.5 seconds
- **3** - 2.0 seconds

If the PCM detects a fault on one of the following systems, it will disable the cruise control system. The PCM will store an appropriate DTC.

- Engine Speed Sensor
- Sensor or actuators of the electric throttle (only for gasoline engines)
- Accelerator Pedal Potentiometer (APP Sensor)
- Brake Pedal Position
- Clutch Switch rationality
- Engine Load sensor (only for gasoline engines)
- Ignition Coils (only for gasoline engines)
- Fuel Injectors
- Turbo sensors or actuators

The PCM and ACC module continuously monitor all of the speed control system electrical circuits to determine the system readiness and accuracy. If the PCM or ACC module detects a monitored system fault, it sets and stores a Diagnostic Trouble Code (DTC). The PCM and ACC components use On-Board Diagnostics (OBD) and can communicate with other electronic modules in the vehicle as well as with the diagnostic scan tool using the CAN data bus. This method of communication is used for control of the Malfunction Indicator Lamp (MIL) (also known as the Check Engine lamp) in the Instrument Cluster (IC) and for system diagnosis and testing through the 16-way data link connector located on the driver side lower edge of the instrument panel.

The hard wired inputs and outputs for the PCM and the ACC module may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the PCM, the ACC module or the electronic controls or

communication between other modules and devices that provide features of the adaptive speed control system. The most reliable, efficient, and accurate means to diagnose the PCM, the ACC module or the electronic controls and communication related to speed control system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SPEED CONTROL SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Refer to WARNING . Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

The hard wired inputs and outputs of the speed control system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the multi-function switch integral to the Steering Column Control Module (SCCM), the SCCM microcontroller, the Antilock Brake System (ABS) module, the Powertrain Control Module (PCM) or the electronic controls and communication between modules and other devices that provide some features of the speed control system. The most reliable, efficient and accurate means to diagnose the multifunction switch, the SCCM microcontroller, the ABS module, the PCM or the electronic controls and communication related to speed control system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

SWITCH, SPEED CONTROL

DESCRIPTION

DESCRIPTION

Fig. 1: Speed Control Switch Pod
Courtesy of CHRYSLER GROUP, LLC

The speed control switch pod is located in the right spoke of the steering wheel spoke bezel. Two different switches are used. One switch has five buttons and is used on vehicles not equipped with the optional Adaptive Cruise Control (ACC) system. The other switch has eight buttons and is used on vehicles equipped with the ACC system option. These switches are the primary control used by the vehicle operator to manage the particular speed control system installed in the vehicle. The only visible components of the switch pod are the switch push buttons and a decorative bezel around the push buttons, which stands slightly proud of the steering wheel spoke bezel. The remainder of the switch pod including its mounting provisions and its electrical connection are concealed beneath the spoke bezel.

The switch pod housing and push buttons are constructed of molded plastic. Each of the push buttons has white International Control and Display Symbol graphics or text applied to it, which clearly identify the function of each push button. The switch pod is secured through three integral mounting tabs to mounting bosses on the back of the spoke bezel by three screws. A connector receptacle integral to the inboard end of the switch pod housing connects the speed control switch and the Local Interface Network (LIN) slave node circuitry integral to the switch pod to the vehicle electrical system through a dedicated take out and connector of the steering wheel wire harness.

The speed control switch pod cannot be adjusted or repaired. If any function of the switch or the LIN slave node is ineffective or damaged, the switch pod must be replaced.

OPERATION

OPERATION

- The speed control switch pod is a LIN unit that provides LIN bussed inputs to the Steering Column Control Module (SCCM) microcontroller.
- The driver acts on the speed control switch assembly installed into the steering column.
- SCCM acquires LIN inputs from the speed control push button assembly and then transmits the status via CAN-C network to the Powertrain Control Module (PCM).

- PCM manages the Speed Control algorithm to maintain vehicle speed established by the driver. It is also the responsibility of the PCM to send out cruise control override information and perform stuck button diagnostics.
- The radio switch resistive ladder inputs are read by the steering wheel switch bank and broadcasts the signals on LIN

The speed control switch pod for vehicles equipped with a conventional electronic speed control system and not equipped with the optional Adaptive Cruise Control (ACC) system contains five switch push buttons whose functions are:

- **On/Off** - This switch button enables or disables the speed control system and clears any previous speed control set speed from system memory.
- **Set (+)** - This switch button sets the current vehicle speed as the stored set speed or accelerates the vehicle to a speed that is faster than the already attained set speed.
- **Set / (-)** - This switch button sets the current vehicle speed as the stored set speed or decelerates (coasts) the vehicle to a speed that is slower than the already attained set speed.
- **Resume / (+)** - Resume is a momentary switch that allows the driver to re-engage Cruise Control to the last stored vehicle speed, provided that the cruise control system is still enabled and current vehicle speed is greater than the calibrated minimum resume speed.
- **Cancel** - This switch button cancels the current speed control event, but does not turn the system OFF or clear the currently stored set speed.

The optional adaptive speed control switch pod for vehicles equipped with the ACC system option contains the same five switch push buttons as the conventional speed control switch pod, then adds three buttons whose functions are:

- **Mode** - This switch button toggles the speed control system between ACC or conventional (non-ACC) modes of operation.
- **Distance Buttons** - These switch buttons select the separation or following distance (in seconds) that the ACC system maintains between this vehicle and any preceding vehicle.

The SCCM LIN master node provides a clean ground and fused B(+) current for all of the switches and sensors on the rotating steering wheel through the LIN slave node circuitry of the speed control switch pod as well as for the Light Emitting Diode (LED) back lighting of both the speed control and the EVIC switch pods. The SCCM continually monitors all of the hard wired speed control switch circuits as well as the LIN bus data. The SCCM will set a Diagnostic Trouble Code (DTC) for any problem it detects in the speed control switch circuits, and will store a Signal Not Available (SNA) code for any LIN bus input errors. The SCCM also communicates with other electronic modules over the Controller Area Network (CAN) data bus. Therefore, any SCCM DTC information can be retrieved using a diagnostic scan tool connected to the Data Link Connector (DLC).

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SPEED CONTROL SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service.

Refer to WARNING . Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

The hard wired inputs and outputs of the speed control system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the Local Interface Network (LIN) slave node integral and internal to the speed control switch, the Steering Column Control Module (SCCM) integral and internal to the multi-function switch, the Antilock Brake System (ABS) module, the Powertrain Control Module (PCM) or the electronic controls and communication between modules and other devices that provide some features of the speed control system. The most reliable, efficient and accurate means to diagnose the LIN slave node, the SCCM, the ABS module, the PCM or the electronic controls and communication related to speed control system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Refer to WARNING . Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

1. Remove the air bag from the steering wheel. Refer to **AIR BAG, DRIVER, REMOVAL** .
2. Remove the remote radio switch on the speed control switch bezel side of the steering wheel. Refer to **SWITCH, REMOTE RADIO, REMOVAL** .

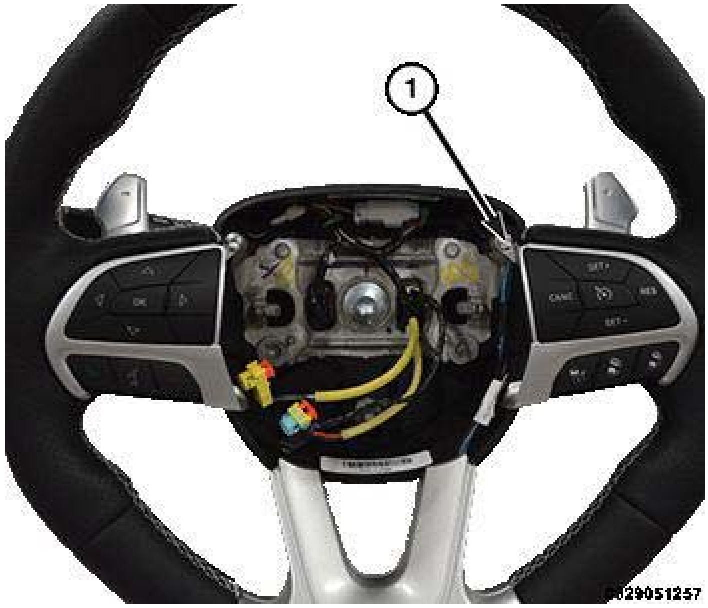

Fig. 2: Speed Control Switch Screw
Courtesy of CHRYSLER GROUP, LLC

3. Remove screw from front if speed control switch bezel to steering wheel.
4. From the backside of the steering wheel, remove two screws securing the speed control switch bezel to the steering wheel.
5. Disconnect the electrical connection from the switch bezel.
6. Remove the switch from the bezel.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Refer to WARNING . Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

1. Position the Speed Control switch pod to the back of the steering wheel armature.

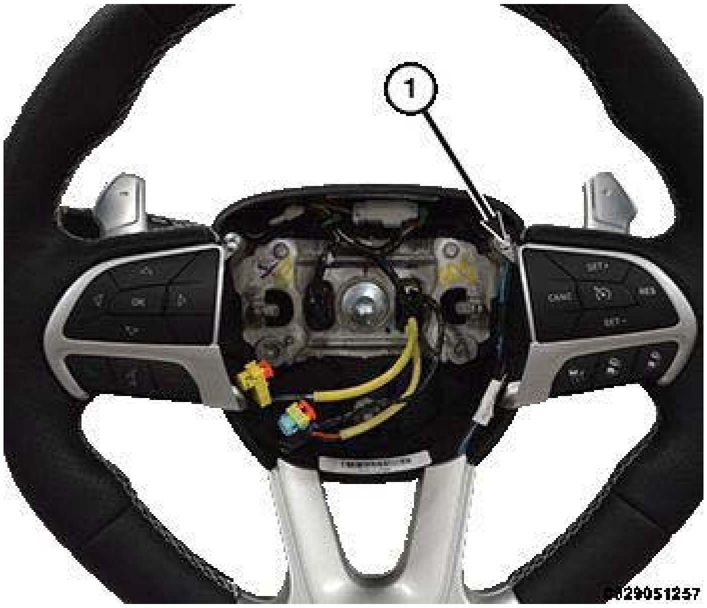

Fig. 3: Speed Control Switch Screw
Courtesy of CHRYSLER GROUP, LLC

2. Install and tighten the three screws (one front (1), two back) securing the speed control switch bezel to the steering wheel armature.
3. Connect the wiring harness to the speed control switch bezel.
4. Install the remote radio switch. Refer to **SWITCH, REMOTE RADIO, INSTALLATION** .
5. Install the air bag. Refer to **AIR BAG, DRIVER, INSTALLATION** .
6. Connect the negative battery cable.

.

Starting - Non-DTC Based Diagnostics - Challenger

DIAGNOSIS AND TESTING

NO CRANK (BCM EQUIPPED)

For a complete wiring diagram, **refer to SYSTEM WIRING DIAGRAMS article** .

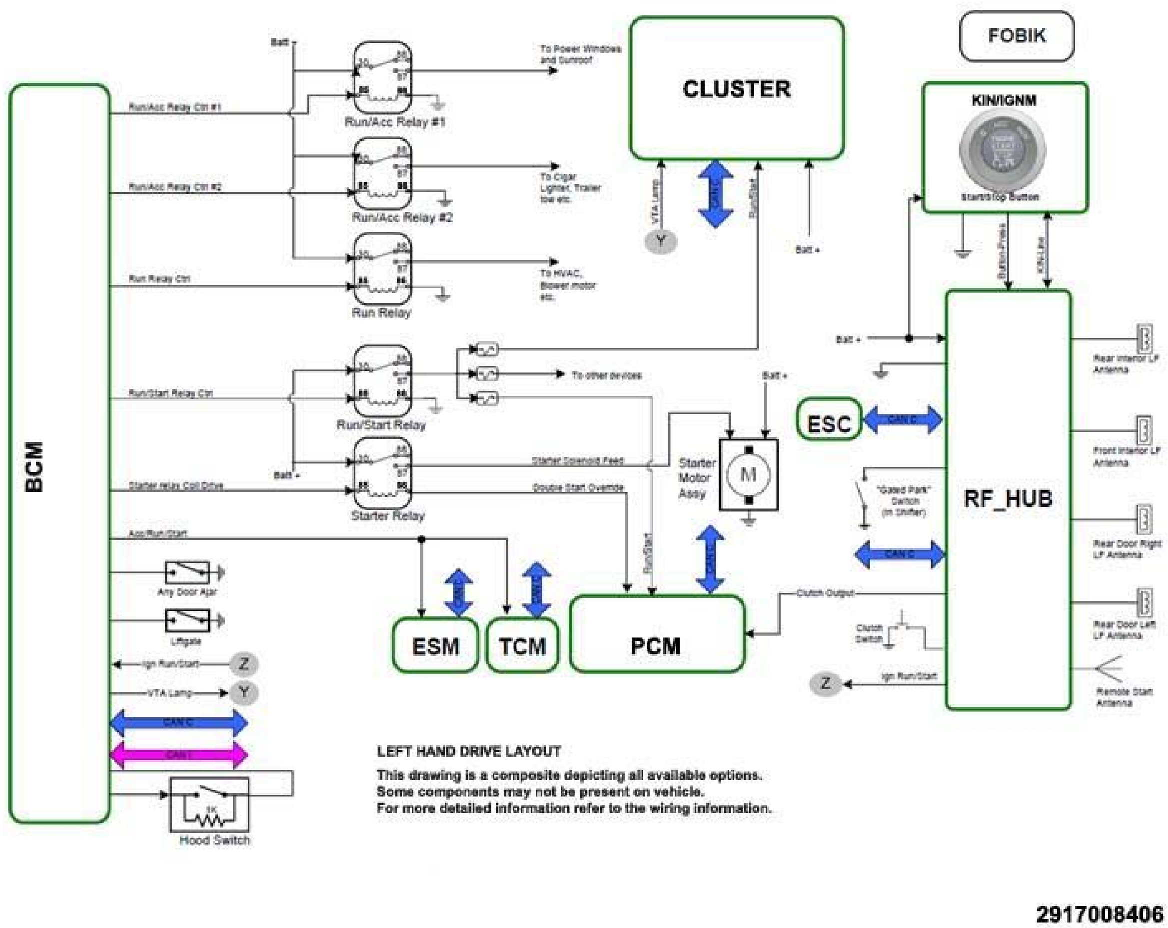

Fig. 1: Starting System Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

This vehicle may come equipped with one of two types of ignitions, the IGNM (IGnition Node Module) or a KIN (Keyless Ignition Node). The KIN uses a Keyless Go Start/Stop push button for cycling the ignition on/off. The IGNM does not use a Keyless Go Start/Stop push button, instead providing a visible slot for the FOBIK to fit into for cycling the ignition on/off.

When the operator presses the Start/Stop Button on a KIN or cycles the FOBIK in a IGNM type ignition, the FOBIK is validated wirelessly by the RF Hub (Radio Frequency Hub Module). If the FOBIK is recognized as belonging to the vehicle and is inside the vehicle, the system allows the ignition state of the vehicle to be

changed by the operator between the LOCK, ACCESSORY, RUN, and START ignition states.

LED Operation

The LEDs in the IGNM and Start/Stop Button provide visual indication of the ignition system and button use to aid the driver. The Logic for LED control is implemented in the IGNM and RF HUB. The IGNM and Start/Stop Button contain four LEDs:

- OFF Indication
- ACC Indication (Accessory)
- ON Indication (On or Run)
- Ignition Switch Indicator (button backlight)

The LEDs indicate the vehicle ignition position and are driven by the CAN bus signals related to the ignition position. The Center LED (Ignition Switch Indicator) will blink if there is a related concern.

The RF HUB will log a DTC indicating an incorrect Ignition status value is present; in this state the ignition status is unknown. This will continue until the correct signal is received by the RF Hub.

EVIC Operation

The Keyless Go feature requires the vehicle to be equipped with an EVIC display for prompts and status information. The display messages are:

- Service Keyless System
- FOB Not Detected
- FOB Left Vehicle
- Not in Park
- Push Brake Pedal and Push Button to Start
- Push Clutch Pedal and Push Button to Start
- Vehicle not in Park Warning

BCM/RF Hub Module Interaction

There are a few things that must take place before the starter relay can apply voltage to the starter. Below are some key points to check when diagnosing a no crank condition.

The BCM requires two signals from the RF HUB to verify the ignition is in the run or start position. The voltage on the F20 circuit is one of these signals. It can be monitored in both the RF HUB and BCM data display screens as the Ignition Run/Start under the "Sensor" value. The run or start position voltage on this circuit should be at or close to battery voltage.

Simultaneously the RF HUB busses the Ignition Run/Start status to the BCM. The BCM monitors the bussed input information as the secondary verification on the Ignition Run/Start status. The bussed messages can be monitored with the scan tool in both the RF HUB and BCM data display screens.

The F20 circuit voltage and the bussed ignition run/start status message received by the BCM must agree to enable starting. Once the vehicle is started, the loss of only one ignition signal will not cause the vehicle to

cycle off as long as the other feed still indicates a "run status".

The RF HUB also requires an input from the Gated park switch (hardwired) and the OK to start CAN Bus message from the TCM (Crank Enable).

Diagnostic Aids

NOTE: **The No Crank Diagnostic serves as an aid in diagnosing the concern and is intended to be used as a general guide, since each no crank condition can be unique.**

The No Crank Diagnostic Test assumes all of the following to be true:

- Communication to all configured modules in the vehicle is possible with the scan tool.
- The condition is currently present.
- The TCM, PCM, RF HUB, and BCM are at the latest calibration (part number) levels.
- There are no active DTCs.
- There are no applicable Recalls.
- There are no applicable TSBs.
- There are no PCM inhibits (i.e. RPM, Trans Range, Clutch).
- The FOBIKs complete function and operation is correct.
- All battery cables and connections are clean and tight.
- There are no open fuses.
- The battery is fully charged and can pass a load test from the GR8 tester.
- The engine rotates freely.
- Any aftermarket equipment/wiring that has been installed is operating correctly.

Starter Relay Operation

In a no crank condition the Starter Relay can be missing power at pin 85, feed at pin 30, controlled ground at pin 86 or output at pin 87. Further explanation of how a relay operates is listed below:

- Pin 85 receives power from the BCM once the parameters for the Ignition Switch position and status, and all inhibit monitors (i.e. clutch switch, RPM, etc.) are satisfied.
- Pin 30 is a constant B+ feed.
- Pin 86 is a controlled ground by a module (i.e. PCM or BCM). Once power is sent from the BCM to the pin 85 of the relay it passes through a coil and leaves the relay through pin 86 to the control module.
- Pin 87 is an output circuit to the Starter solenoid. Once the circuit on pin 86 is grounded by the control module, the coil winding in the relay magnetically pulls the internal switch closed. When the internal switch is closed the power at pin 30 is sent to pin 87 of the relay.

DIAGNOSTIC TEST

1. **STARTER RELAY CHECK**
    1. When attempting to start the vehicle, listen and if needed feel for a click at the starter relay in the

PDC.

NOTE: **Some starter relays are internal to a module and may not be accessible, making it more difficult to hear, or feel the clicking response. It is possible for a poor ground or the Trans Range Sensor position to be lost causing the starter to click once.**

Did you hear an audible click at the relay or starter?

Yes

- Go To Step 9

No

- Go To Step 2

2. **STARTER RELAY INPUT CHECK**
    1. Use a 12-volt test light/DVOM to check for power at pin 85 of the starter relay.

       Is there Power/12 volts at pin 85?

       Yes

       - Go To Step 8

       No

       - Go To Step 3
3. **RF HUB OPERATION**
    1. Using the scan tool, confirm the ignition switch status changes in the RF HUB under the data display screen for the "Sensor" values.

       Does the ignition switch status on the data screen match the physical position of the KIN/IGNM?

       Yes

       - Go To Step 5

       No

       - Go To Step 4
4. **REMOTE START ANTENNA**

    NOTE: **If the vehicle is not equipped with Remote Start, proceed to the next test step.**

    1. Cycle the ignition off.
    2. Disconnect the Remote Start Antenna from the RF HUB.
    3. Using one FOBIK and sitting in the driver's seat, attempt to start the vehicle.

Did the vehicle start?

Yes

- Replace the Remote Start Antenna in accordance with the Service Information.
- Perform the **BODY VERIFICATION TEST** .

No

- Go To Step 5

5. **BCM IGNITION STATUS**
   1. Using the scan tool, confirm the ignition switch status changes in the BCM under the data display screen for the "Bussed Input" and "Sensor" values.

   NOTE: **The change of status in the BCM for the "Sensor" value validates the voltage activity (with very low amperage) of the F20 circuit.**

   In the BCM, do both values for the ignition switch status match; and do they match those in the RF HUB?

   Yes

   - Go To Step 6

   No

   - If the status of the Ignition Switch position is not changing under the "Sensor" value, check the F20 circuit at the BCM for battery voltage with a DVOM (not a test light).
   - If there is Battery voltage **at the BCM on the F20 circuit** verify all power, ground and bus circuits are OK for the BCM. If no problem found replace the BCM in accordance with Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - If there is **NO** Battery voltage **at the BCM** on the F20 circuit, then check for voltage on the F20 circuit at the RF HUB.
   - If there is Battery voltage **coming out of the RF HUB on the F20 circuit** , check the F20 circuit between the RF HUB and BCM for a short, open condition or high resistance.
   - If there is **NO** Battery voltage **coming out of the RF HUB on the F20 circuit** verify all power, ground & communication circuits, & connections to the RF HUB prior to replacing. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
   - In the data screen, if the status of the Ignition Switch was not changing under the "Bussed Input" value, further diagnosis is needed between the RF HUB, (bus circuits, connections) and the BCM.
6. **PCM IGNITION, TRANS RANGE/CLUTCH SWITCH STATUS VERIFICATION**
   1. Using the scan tool confirm there are no inhibits that have been triggered in the PCM (i.e. Ignition Switch, Trans Range or Clutch Switch) and any switch inputs (filtered states) relating to the starting system function and operate correctly under the data display screen.

   Does the PCM show any inhibits (**not DTCs**) for starting (**not remote starting**)?

Yes

- Correct the inhibit reason listed.
- If no problem can be found, then verify all power, ground and bus circuits to the PCM and replace the PCM in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .

No

- Go To Step 7

7. **BCM TO STARTER RELAY POWER INPUT CHECK**
   1. At this time if all the correct inputs for the ignition switch status are correct in the RF HUB, BCM and PCM, verify both power feeds are present (pin 30 and 85) to the Starter Relay while in the crank position.

      Are both power feeds present at the relay when the ignition is in the crank position?

      Yes

      - Go To Step 8

      No

      - If, there is no power to pin 30 or 85, no DTCs, TSBs, Recalls, or Inhibits replace the BCM in accordance with Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
8. **STARTER RELAY CONTROL CIRCUIT CHECK**
   1. Using a test light/DVOM determine if the Starter Control circuit at pin 86 of the relay is missing ground (at the relay if equipped with a removable relay or wiring to the internal relay) when the ignition is in the crank position.

      Was the Starter Control circuit for pin 86 being grounded when the ignition was in the crank position?

      Yes

      - Go To Step 10

      No

      - Verify the Starter Relay Control circuit from pin 86, has no shorts, opens or high resistance on the wiring going from the Starter Relay in the BCM (or PDC) to the PCM.
      - Verify the cables do not have excessive resistance by performing a voltage drop on the battery cables.
9. **STARTER RELAY OUTPUT CIRCUIT CHECK**

NOTE: **At this point in the test, when the key is in the crank position power has been verified at Pin 30 & 85, along with the control circuit being grounded**

for pin 86.

1. Remove the Starter Relay Output circuit connector from the Starter solenoid.
2. Using a test light/DVOM and ignition in the crank position check for power at pin 87 (If equipped with a removable relay or wiring to the internal relay) of the relay and at the connection to the starter.

   Was there power at pin 87 for the output circuit?

   Yes

   - Go To Step 10

   No

   - If power is missing to pin 30 of the starter relay the BCM is suspect. Verify all power, ground, communication circuits and connections to the BCM before replacing in accordance with service information.
   - If power is missing at pin 87 of the starter relay and the relay is replaceable, change out the relay and recheck the concern. If a known good relay causes no change, check the Starter Output circuit from pin 87 of the relay to the starter for an open, short, excessive resistance, or poor connections to the solenoid or starter.
   - Verify and Inspect the Starter to ensure it is free of corrosion, oil, and there is no damage, or binding conditions.
   - Verify that all wiring, cables and connections are clean and tight.

10. **STARTER RELAY OUTPUT CIRCUIT LOAD TEST**
    1. Load test the Starter Relay output circuit going from the BCM to the Starter.

       Does the starter relay output circuit pass the load test?

       Yes

       - Verify that all connections are clean, tight and there is no damage to starter when fully inspected. If no problem found then replace the Starter in accordance with Service Information. Refer to **STARTER, REMOVAL** .

       No

       - Adjust the shift cable in accordance with the Service Information. Perform the POWERTRAIN VERIFICATION TEST. Refer to appropriate ELECTRICAL DIAGNOSTICS article.

REMOTE START INOPERATIVE (BCM - RF HUB EQUIPPED)

For a complete wiring diagram, **refer to SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The customer may notice that the signal range of the Remote Keyless Entry (RKE) system is reduced. This

condition may be due to the RKE antenna where the RKE key fob may need to be closer than 3 meters (10 feet) before the functions available on the key fob will operate. The diagnostic test is provided as a diagnostic aid for the dealer technician.

It is necessary to confirm the correct sales code(s) are present in the Standard and Optional Equipment sections of DealerCONNECT to determine if a factory or a MoparÂ® Accessory Remote Start kit was installed. If the vehicle has a MoparÂ® Accessory Remote Start kit, verify that at least 20 minutes has elapsed since the sales codes were added to DealerCONNECT. Once it has been confirmed that the proper sales codes have been added and the allotted time has passed, verify the vehicle has been configured properly using the scan tool. Also, make sure that the system shows as enabled in the BCM and that the temporary remote start override is set to disabled.

For any further assistance on diagnosing the installed MoparÂ® Accessory kit contact the MoparÂ® Accessories group at 800-84-MOPAR (66787).

DIAGNOSTIC TEST

1. **REMOTE START FUNCTION**

   NOTE: In some cases the vehicle will start then stall, indicating a fuel level concern (less than a quarter of a tank). Before proceeding verify there is enough fuel in the tank for the vehicle to start and run.

   1. Attempt to start the vehicle with the FOBIK.

      Does the vehicle start when using the FOBIK?

      Yes

      - At this time the Remote Start is functioning properly.
      - Using the scan tool, check for any related Starting, Communication, or Ignition related DTCs that may inhibit the Remote Starting feature. Check the BCM for any previous Remote Start Inhibits and mileage that were stored. Inhibits may be found under the system tests or miscellaneous functions tab.

      No

      - Go To Step 2
2. **REMOTE START VISUAL CHECK**
   1. While pressing the remote start button on the FOBIK, observe the exterior lights and the horn operation.

      Does the horn sound and the exterior parking lights flash?

      Yes

      - Go To Step 3

      No

- Go To Step 4

3. **CHECKING BCM INHIBITS**

   NOTE: Since the horn sounds and the parking lights flash, this verifies the BCM is receiving the CAN BUS message from the RF HUB. It also verifies the RF signal for Remote Start from the FOBIK to the RF HUB is operating correctly.

   1. Using the scan tool, check the Remote Start inhibits of the BCM or any ACTIVE DTCs listed in all modules.

      NOTE: Inhibits may be found under the system tests or miscellaneous functions tab. The fuel level may not be a listed inhibit.

      Are there any Remote Start inhibits or any ACTIVE DTCs listed in the entire vehicle?

      Yes

      - For any inhibits for a complete list of Remote Start inhibits. Refer to **DIAGNOSIS AND TESTING** .
      - For any ACTIVE DTCs, perform the appropriate diagnostic procedure in **DTC INDEX** article.

      No

      - Check for any related TSBs prior to replacing the BCM. If no related TSBs are found, then replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .

4. **RKE FUNCTION SHORT RANGE**
   1. While standing next to the Driver door and using the FOBIK, attempt to lock and unlock the doors.

      Does the RKE function properly?

      Yes

      - Go To Step 5

      No

      - Go To Step 7

5. **RKE FUNCTION MID RANGE**
   1. While standing 20 feet from the vehicle and using the FOBIK, attempt to lock and unlock the doors.

      Does the RKE function properly at 20 feet?

      Yes

      - Go To Step 6

No

- Go To Step 7

6. **RKE FUNCTION LONG RANGE**
    1. While standing 100 feet from the vehicle and using the FOBIK, attempt to lock and unlock the doors.

       Does the RKE function properly at 100 feet?

       Yes

       - Go To Step 9

       No

       - Go To Step 7
7. **FOBIK SIGNAL STRENGTH**
    1. Use the RF Tester 9001 to check the signal strength of the FOBIK.

       Does the FOBIK pass?

       Yes

       - Go To Step 10

       No

       - Go To Step 8
8. **CHECKING THE FOBIK**
    1. Replace the battery in the FOBIK with a known good battery and recheck the signal from the FOBIK with the RF Tester 9001.

       Does the FOBIK pass?

       Yes

       - Go To Step 9

       No

       - Check for any related TSBs prior to replacing the FOBIK. If no related TSBs are found, then replace the FOBIK in accordance with the Service Information.
9. **CHECKING FOR ACTIVE DTCs**

   NOTE: **The RKE portion of the FOBIK is operational, this verifies that the RF HUB is capable of receiving signals and communicating to operate the locks.**

    1. Use the scan tool to check for ACTIVE DTCs.

Did the scan tool show any ACTIVE DTCs in the entire vehicle?

Yes

- Diagnose the DTCs in accordance with the Service Information before proceeding with the Remote Start Inoperative concern.

No

- Go To Step 10

10. **CHECKING THE RF HUB**

NOTE: **Even though the RKE function of the system may work with no concern, the BCM is either not receiving a message or is receiving a corrupt message from the RF HUB for remote start operation.**

1. While sitting in the driver seat and using the scan tool, monitor the RF HUB on the data display screen for changes when the Remote Start button of the FOBIK is pressed.

Did the status change when the Remote Start button of the FOBIK was pressed?

Yes

- Go To Step 11

No

- Go To Step 12

11. **CHECKING BCM INHIBITS**

NOTE: **The parking lights flash and the horn are inoperative when using the FOBIK, this indicates a faulty BCM or "Inhibit" that may be preventing the start request from occurring.**

1. Use the scan tool to check for any Remote Start inhibits listed in the BCM. This may be found under the system tests or miscellaneous functions tab.

Were there any Remote Start inhibits listed in the BCM?

Yes

- Perform the REMOTE START SYSTEM Diagnosing and Testing. Refer to **DIAGNOSIS AND TESTING** .

No

- If this has had a MoparÃ® Accessory kit installed verify the correct Sales Code for Remote Start has been added to Dealer Connect and a Restore Vehicle Configuration has been performed.
- Confirm the system is enabled; and the temporary Remote Start override is set to disabled in

the BCM and contact the MoparÂ® Accessories group (800-84-Mopar) for further details before proceeding.

- If this has a factory installed Remote Start, check for any related TSBs prior to replacing the BCM. If no related TSBs are found, then replace the BCM in accordance with the Service Information.

12. **CHECKING THE REMOTE START ANTENNA**
    1. Cycle the ignition off
    2. Disconnect the Remote Start antenna from the RF Hub.
    3. Using one FOBIK and sitting in the driver's seat, attempt to start the vehicle.

    Did the vehicle start?

    Yes

    - Replace the Remote Start Antenna in accordance with the Service Information.
    - Perform the BODY VERIFICATION TEST. **BODY VERIFICATION TEST**

    No

    - Verify all power, ground, communication circuits, & connections to the RF HUB prior to replacing. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .

Article GUID: A00735950

2015-16 ENGINE

Starting - Service Information - Challenger

DESCRIPTION

REMOTE START SYSTEM

NOTE: Available on automatic transmission equipped vehicles only.

Remote start conveniently starts the engine from outside the vehicle by using the Remote Keyless Entry (RKE) key fob while maintaining security. The system has a targeted range of 200 ft. (61 m). The vehicle must be locked, the deck lid and hood closed and the transmission in Park in order to start the engine using the Remote Start button on the key fob.

STANDARD STARTING SYSTEM

The starting system consists of:

- Starter relay.
- Starter motor (including an integral starter solenoid).

Other components to be considered as part of starting system are:

- Battery.
- Battery cables.
- Ignition switch and key lock cylinder.
- Clutch pedal position switch (manual transmission).
- Park/neutral position switch (automatic transmission).
- Wire harnesses and connections.

The Battery, Starting, and Charging systems operate in conjunction with one another, and must be tested as a complete system. For correct operation of starting/charging systems, all components used in these 3 systems must perform within specifications. When attempting to diagnose any of these systems, it is important that you keep their interdependency in mind.

The diagnostic procedures used in each of these groups include the most basic conventional diagnostic methods, to the more sophisticated On-Board Diagnostics (OBD) built into the Powertrain Control Module (PCM). Use of an induction-type milliampere ammeter, volt / ohmmeter, battery charger, carbon pile rheostat (load tester), and 12-volt test lamp may be required.

OPERATION

REMOTE START SYSTEM

The optional Smart Remote Start system (which operates from as far as 200 feet) not only starts the vehicle via fob activation, but also activates the climate control and (if equipped) the optional heated/ventilated seats and

optional heated steering wheel depending on temperatures outside and inside the car.

REMOTE START OPERATING CONDITIONS

In order to operate remote start, the following conditions must be met:

- Key fob sequence must be operated within a 200 foot range of the vehicle.
- The vehicle must be in Park.
- Key is not in the ignition.
- The hazard switch off.
- Vehicle Theft Alarm or Panic is not alarming.
- Doors and hood must be closed.
- The battery voltage is within a normal operating range of 11 to 15 volts.

REMOTE START SHUT DOWN/DEACTIVATE CONDITIONS

Engine will NOT start or will shut down/deactivate during any of the following conditions:

- Key in Ignition.
- Doors or hood are opened before remote unlock.
- Hazard Switch depressed.
- Panic or theft alarm active.
- Brake applied.
- A prior remote start cranked the engine, but failed to start the engine.
- Battery voltage NOT in the normal range.
- High (run away) or Low Idle (stall) RPM.
- MIL Active.
- High Engine Coolant Temperature.
- Low Engine Oil Pressure.
- Low fuel levels

INITIATE REMOTE START

To Remote Start the vehicle:

1. Press remote button on the Key Fob twice within 5 seconds.

   NOTE: **Engine will run for 15 minutes after a remote start is initiated. After 15 minutes, the engine will shut off. The system allows for only two sequential remote starts without a key ignition cycle.**

2. Unlock vehicle with Key Fob to enter the vehicle.
3. Put key in ignition, turn key to run position to exit remote start and enter a normal start without engine shut off.

IDENTIFICATION THAT REMOTE START IS ACTIVATED

To identify that Remote Start has been activated the following will occur:

- Horn will sound and lights will flash to acknowledge a start command was received.
- Park Lamps will turn on to indicate that the engine is running in remote start mode.

TERMINATE REMOTE START

To terminate Remote Start, press Remote Start button on the Key Fob once.

NOTE: **In order to avoid inadvertent shut downs, the one-time press to shut down the vehicle will be disabled for two seconds after receipt of a valid remote start request.**

STANDARD STARTING SYSTEM

Starting System Flow

- Pressing the Keyless Ignition Node (KIN Button), a request is sent to the Remote Frequency Hub Module (RFHM) via the private LIN bus.
- The RFHM receives the request from the KIN and then looks for the valid key via the Low Frequency (LF) antennas.
- If the RFHM detects a valid key and if the brake is engaged, then the RFHM sets the ignition position to START/CRANK.
- The Body Control Module (BCM) turns the Ignition status to START/CRANK.
- Then the BCM sends the command to turn the vehicle to CRANK.
- If conditions are correct to start, the Powertrain Control Module (PCM) turns on the high side of the PCM starter relay and turns the Crank Hold Signal to True. If the BCM is still in crank and the Crank Hold is true then the BCM turns on the Low side of the BCM Starter relay and the engine will start cranking.
- Once the engine is started the PCM deactivates the double start over ride.
- The BCM will then deactivate the starter either when the engine starts or the maximum time of 10 seconds has been reach for the tip start.
- The RFHM changes the ignition position to RUN if the start type is TIP start or the 5 second time expires or the engine controller indicates the vehicle is not in park or neutral.
- The engine can be manually shut down by the driver with speeds over 5 MPH in any gear.

DIAGNOSIS AND TESTING

REMOTE START SYSTEM

For diagnostic and testing information, refer to DIAGNOSIS AND TESTING .

STANDARD STARTING SYSTEM

The battery, starting, and charging systems operate in conjunction with one another, and must be tested as a complete system. For correct starting/charging system operation, all of the components involved in these three systems must perform within specifications.

Starting System Diagnosis		
CONDITION	**POSSIBLE CAUSE**	**CORRECTION**
STARTER FAILS TO OPERATE.	1. Battery discharged or faulty.	1. Refer to **BATTERY, DIAGNOSIS AND TESTING** . Charge or replace battery, if required.
	2. Starting circuit wiring faulty.	2. See the appropriate Wiring Information. Test and repair starter feed and/or control circuits, if required.
	3. Starter relay faulty.	3. The starter relay is located within the front Power Distribution Center (PDC). See no crank condition, refer to **DIAGNOSIS AND TESTING** .
	4. Park/Neutral position switch faulty or misadjusted.	4. Refer to Park/Neutral Position Switch. Replace park/neutral position switch if required. See the appropriate TRANSMISSION SERVICE INFORMATION article.
	5. Starter solenoid faulty.	5. Refer to Starter Motor. Replace starter motor assembly if required. See **STARTER**.
	6. Starter motor faulty.	6. If all other starting system components and circuits test OK, replace starter motor. See **STARTER**.
STARTER ENGAGES, FAILS TO TURN ENGINE.	1. Battery discharged or faulty.	1. Refer to **BATTERY, DIAGNOSIS AND TESTING** . Charge or replace battery, if required.
	2. Starting circuit wiring faulty.	2. See the appropriate Wiring Information. Test and repair starter feed and/or control circuits if required.
	3. Starter motor faulty.	3. If all other starting system components and circuits test OK, replace starter motor assembly. See **STARTER**.
	4. Engine seized.	4. Refer to the appropriate Engine Service Information article for diagnostic and service procedures. .
STARTER ENGAGES, SPINS OUT BEFORE ENGINE STARTS.	1. Starter ring gear faulty.	1. Refer to Starter Motor Removal and Installation. Remove starter motor to inspect starter ring gear. Replace starter ring gear if required. See **STARTER**.
	2. Starter motor faulty.	2. If all other starting system components and circuits test OK, replace starter motor assembly. See **STARTER**.
STARTER DOES NOT DISENGAGE.	1. Starter motor improperly installed.	1. Refer to Starter Motor Removal and Installation. Tighten starter mounting hardware to correct torque specifications. See **STARTER**.
	2. Starter relay faulty.	3. The starter relay is located within the front PDC. See no crank condition, refer to **DIAGNOSIS AND TESTING** .
	3. Ignition switch faulty.	4. Replace KIN module if required.

Starting System Diagnosis		
CONDITION	POSSIBLE CAUSE	CORRECTION
	4. Starter motor faulty.	4. If all other starting system components and circuits test OK, replace starter motor. See **STARTER**.

INSPECTION

For complete starter wiring circuit diagrams, refer to **SYSTEM WIRING DIAGRAMS** . Before removing any unit from starting system for repair or diagnosis, perform the following inspections:

WARNING: On vehicles equipped with airbags, refer to RESTRAINTS - SERVICE INFORMATION before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

- **Battery** - Visually inspect battery for indications of physical damage and loose or corroded cable connections. Determine state-of-charge and cranking capacity of battery. Charge or replace battery if required. Refer to **Battery** in the **BATTERY SYSTEM - SERVICE INFORMATION** article .
- **Clutch Pedal Position Switch** - If equipped with manual transmission, visually inspect clutch pedal position switch for indications of physical damage and loose or corroded wire harness connections. Refer to **Clutch Pedal Position Switch** in the **CLUTCH SYSTEM** article .
- **Park/Neutral Position Switch** - If equipped with automatic transmission, visually inspect park/neutral position switch for indications of physical damage and loose or corroded wire harness connections. Refer to **Park/Neutral Position Switch** in the appropriate TRANSMISSION SERVICE INFORMATION article .
- **Starter Relay** - The starter relay is located within the front Power Distribution Center (PDC). Refer to **DIAGNOSIS AND TESTING** .
- **Starter Motor** - Visually inspect starter motor for indications of physical damage and loose or corroded wire harness connections.
- **Starter Solenoid** - Visually inspect starter solenoid for indications of physical damage and loose or corroded wire harness connections.
- **Wiring** - Visually inspect wire harnesses for damage. Repair or replace any faulty wiring, as required. Refer to **SYSTEM WIRING DIAGRAMS** . .

TESTING

COLD CRANKING TEST

NOTE: For complete starter wiring circuit diagrams, refer to SYSTEM WIRING DIAGRAMS . The battery must be fully-charged and load-tested before proceeding. Refer to Battery in the BATTERY SYSTEM - SERVICE INFORMATION article .

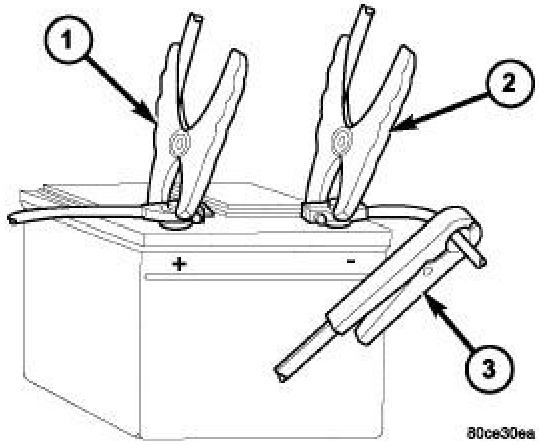

Fig. 1: Induction Ammeter, Positive & Negative Clamp
Courtesy of CHRYSLER GROUP, LLC

1 - POSITIVE CLAMP
2 - NEGATIVE CLAMP
3 - INDUCTION AMMETER CLAMP

1. Connect volt-ampere tester (1) and (2) to battery terminals. See instructions provided by manufacturer of volt-ampere tester being used.
2. Fully engage parking brake.
3. If equipped with manual transmission, place gearshift selector lever in Neutral position and block clutch pedal in fully depressed position. If equipped with automatic transmission, place gearshift selector lever in Park position.
4. Verify that all lamps and accessories are turned off.
5. To prevent a gasoline engine from starting, remove either the ignition run fuse, or the fuel pump control fuse.

WARNING: Attempt to start engine a few times before proceeding with following step.

NOTE: A cold engine will increase starter current (amperage) draw reading, and reduce battery voltage reading.

6. Press and hold the ignition in **Start** position. Note cranking voltage and current (amperage) draw readings shown on volt-ampere tester.
   a. If voltage reads below 9.6 volts, refer to **STANDARD STARTING SYSTEM** . If starter motor is OK, refer to the appropriate Engine Service Information article for further testing of engine. If starter motor is not OK, replace faulty starter motor.
   b. If voltage reads above 9.6 volts and current (amperage) draw reads below specifications, refer to **FEED CIRCUIT TEST** in this service information .
   c. If voltage reads 12.5 volts or greater and starter motor does not turn, refer to **CONTROL CIRCUIT TESTING** in this service information. .
   d. If voltage reads 12.5 volts or greater and starter motor turns very slowly, refer to **FEED CIRCUIT**

TEST in this service information. .

FEED CIRCUIT TEST

The starter feed circuit test (voltage drop method) will determine if there is excessive resistance in high-amperage feed circuit. For complete starter wiring circuit diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

When performing these tests, it is important to remember that voltage drop is giving an indication of resistance between two points at which voltmeter probes are attached.

Example: When testing resistance of positive battery cable, touch voltmeter leads to positive battery cable clamp and cable connector at starter solenoid. If you probe positive battery terminal post and cable connector at starter solenoid, you are reading combined voltage drop in positive battery cable clamp-to-terminal post connection and positive battery cable.

The following operation will require a voltmeter accurate to 1/10 (0.10) volt. Before performing tests, be certain that following procedures are accomplished:

- Battery is fully-charged and load-tested. Refer to **Battery** in **BATTERY SYSTEM - SERVICE INFORMATION** .
- Fully engage parking brake.
- If equipped with manual transmission, place gearshift selector lever in Neutral position and block clutch pedal in fully depressed position. If equipped with automatic transmission, place gearshift selector lever in Park position.
- Verify that all lamps and accessories are turned off.
- To prevent a gasoline engine from starting, remove Automatic Shut Down (ASD) relay. These relays are located in front PDC. Refer to label on PDC cover for relay location.

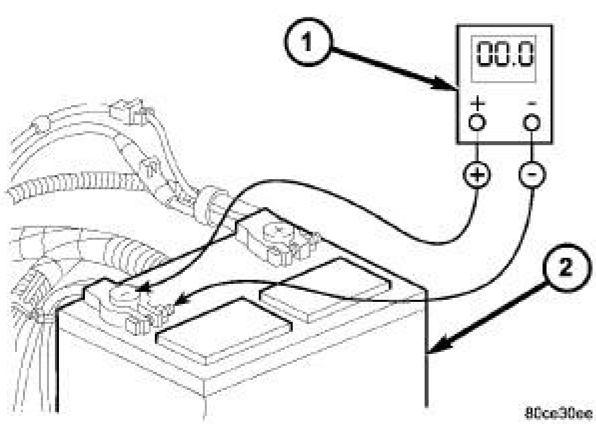

Fig. 2: Testing Battery Negative Connection Resistance - Typical
Courtesy of CHRYSLER GROUP, LLC

1 - VOLTMETER	
2 - BATTERY	

1. Connect positive lead of voltmeter (1) to negative battery cable terminal post. Connect negative lead of voltmeter to negative battery cable clamp. Press and hold the ignition in **Start** position. Observe voltmeter. If voltage is detected, correct poor contact between cable clamp and terminal post.

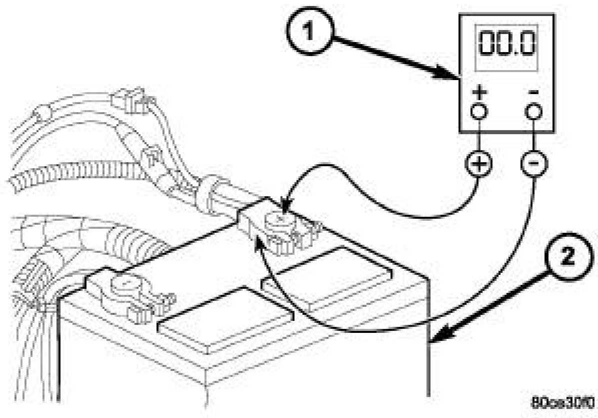

Fig. 3: Testing Battery Positive Connection Resistance - Typical
Courtesy of CHRYSLER GROUP, LLC

1 - VOLTMETER
2 - BATTERY

2. Connect positive lead of voltmeter to positive battery terminal post. Connect negative lead of voltmeter to battery positive cable clamp. Press and hold the ignition in **Start** position. Observe voltmeter. If voltage is detected, correct poor contact between cable clamp and terminal post.

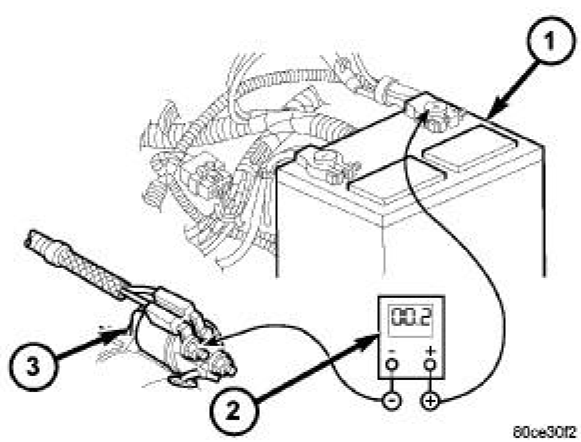

Fig. 4: Testing Battery Positive Cable Resistance - Typical
Courtesy of CHRYSLER GROUP, LLC

1 - BATTERY
2 - VOLTMETER
3 - STARTER MOTOR

3. Connect voltmeter to measure between battery positive terminal post and starter solenoid battery terminal stud. Press and hold the ignition in **Start** position. Observe voltmeter. If reading is above 0.2 volt, clean and tighten battery cable connection at solenoid. Repeat test. If reading is still above 0.2 volt, replace faulty positive battery cable.

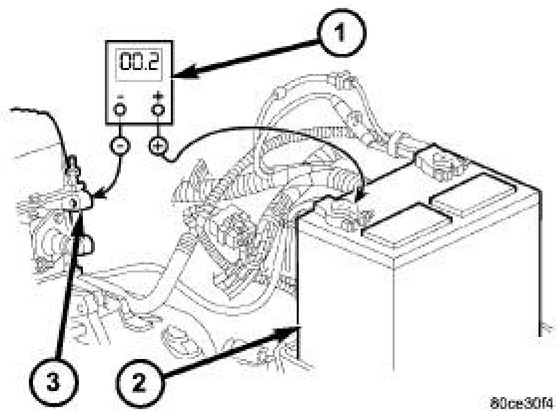

Fig. 5: Testing Ground Circuit Resistance - Typical
Courtesy of CHRYSLER GROUP, LLC

1 - VOLTMETER
2 - BATTERY
3 - ENGINE GROUND

4. Connect voltmeter to measure between negative battery terminal post and a good clean ground on engine block. Press and hold the ignition in **Start** position. Observe voltmeter. If reading is above 0.2 volt, clean and tighten negative battery cable attachment on engine block. Repeat test. If reading is still above 0.2 volt, replace faulty negative battery cable.

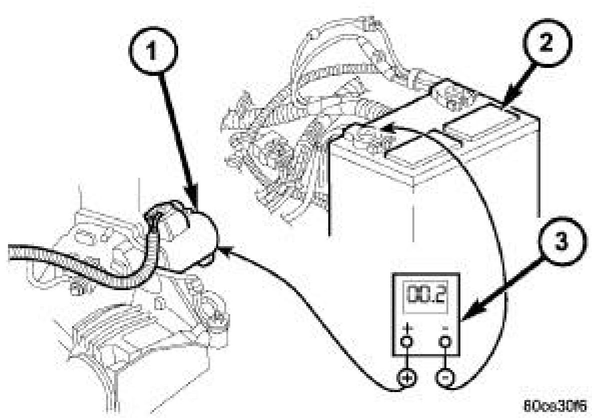

Fig. 6: Testing Starter Ground - Typical
Courtesy of CHRYSLER GROUP, LLC

1 - STARTER MOTOR

2 - BATTERY
3 - VOLTMETER

5. Connect positive lead of voltmeter to starter housing. Connect negative lead of voltmeter to negative battery terminal post. Press and hold the ignition in **Start** position. Observe voltmeter. If reading is above 0.2 volt, correct poor starter to engine block ground contact.
6. If equipped with dual battery system, connect positive lead of voltmeter to positive battery cable clamp on battery located on left side of vehicle. Connect negative lead of voltmeter to positive battery terminal post on battery located on right side of vehicle. Press and hold the ignition in **Start** position. Observe voltmeter. If reading is above 0.2 volt, clean and tighten battery cables at both batteries. Repeat test. If reading is still above 0.2 volt, replace faulty positive battery cable.

If resistance tests detect no feed circuit problems, refer to STANDARD STARTING SYSTEM .

CONTROL CIRCUIT TESTING

The starter control circuit components should be tested in the order in which they are listed, as follows:

- **Starter Relay** - The starter relay is located within the PDC. Refer to DIAGNOSIS AND TESTING .
- **Starter Solenoid** - Refer to **Starter Motor** DIAGNOSIS AND TESTING .
- **Ignition Switch** - Refer to **Ignition Switch and Key Lock Cylinder**
- **Clutch Pedal Position Switch** - If equipped with manual transmission, refer to **Clutch Pedal Position Switch** . See CLUTCH SYSTEM .
- **Park/Neutral Position Switch** - If equipped with automatic transmission, refer to **Park/Neutral Position Switch** in the appropriate TRANSMISSION SERVICE INFORMATION article .
- **Wire harnesses and connections** - Refer to SYSTEM WIRING DIAGRAMS .

SPECIFICATIONS

STARTER MOTOR

Engine Application	Power Rating	Cranking Amperage Draw Test	
3.6L	1.2 Kilowatt / 1.6 Horsepower	100 - 300 Amperes	
5.7L	1.4 Kilowatt / 1.87 Horsepower	100 - 300 Amperes	
6.2L	1.4 Kilowatt / 1.87 Horsepower	100 - 300 Amperes	
6.4L	2.0 Kilowatt / 1.87 Horsepower	100 - 300 Amperes	
* Test at operating temperature. A cold engine, tight (new) engine, or heavy oil increases starter amperage draw. Starters are equipped with permanent magnets. Never strike the starter case in an attempt to loosen a sticking/stuck armature as the permanent magnets may crack or break.			Ā

ANTENNA, REMOTE START

DESCRIPTION

DESCRIPTION

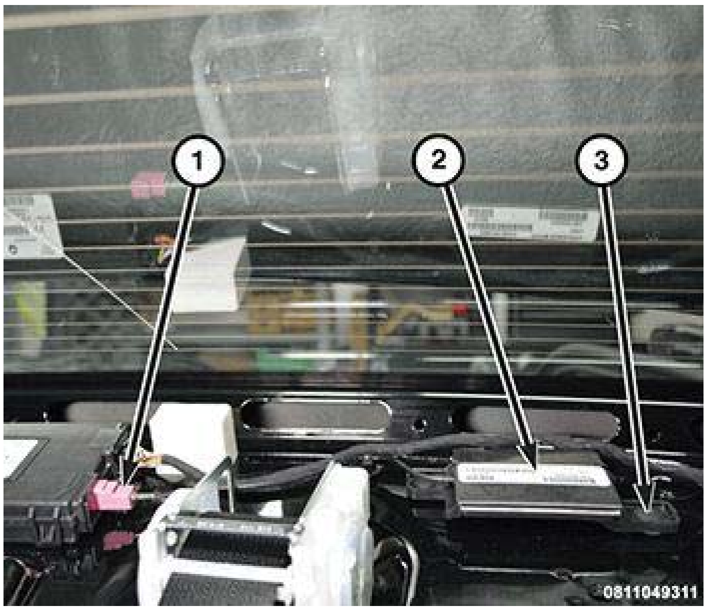

Fig. 7: Remote Frequency Hub Module (RFHM) Jump Wire, Remote Start Antenna Module & Push Tab
Courtesy of CHRYSLER GROUP, LLC

The Remote Start Antenna Module Assembly (2) consists of an electrical connection to the Radio Frequency Hub Module (RFHM) (1), a short length of coaxial cable with a connection to the RFHM, two mounting clips (3), and the control module/antenna. The antenna is located on the rear shelf package tray area next to the RFHM. The antenna which is printed on a circuit board in an enclosed plastic housing that is fed regulated 5v DC (+/-5%) via the attached coaxial cable pigtail. The Remote Start Antenna captures radiated RF signals that are transmitted from the Key FOB transmitter throughout the intended broadcast bands. The RF signal captured is then amplified and sent to the desired receiver/tuner.

OPERATION

OPERATION

The Remote Start Antenna is used to receive the signal from the remote key. The antenna captures radiated RF signals that are transmitted from the Key FOB transmitter throughout the intended broadcast bands. The RF signal captured is then amplified and sent to the Remote Frequency Hub Module (RFHM).

REMOVAL

REMOVAL

1. Disconnect the negative battery cable.
2. Remove the trim panel from the rear shelf. Refer to **PANEL, REAR SHELF, REMOVAL** .

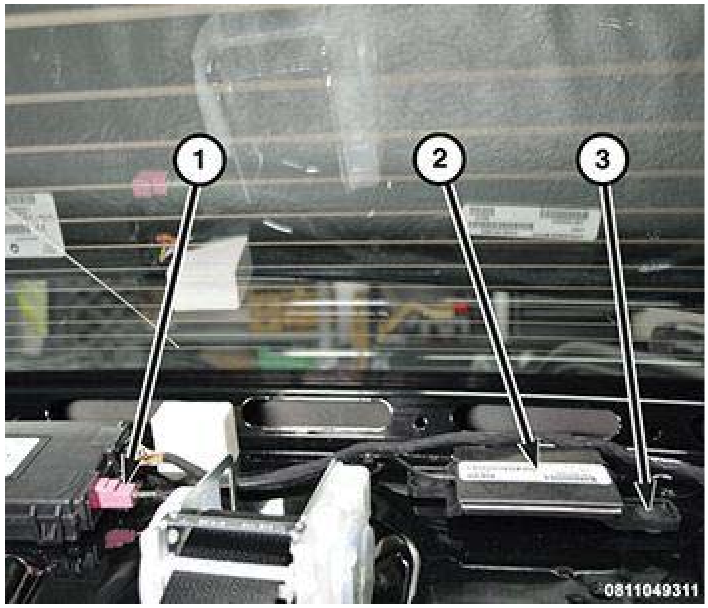

Fig. 8: Remote Frequency Hub Module (RFHM) Jump Wire, Remote Start Antenna Module & Push Tab
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the remote start antenna from the Remote Frequency Hub Module (RFHM) jump wire (1).
4. Remove the two push tabs (3) securing the remote start antenna to the shelf.
5. Remove the remote start antenna module (2) from the mounting bracket.

INSTALLATION

INSTALLATION

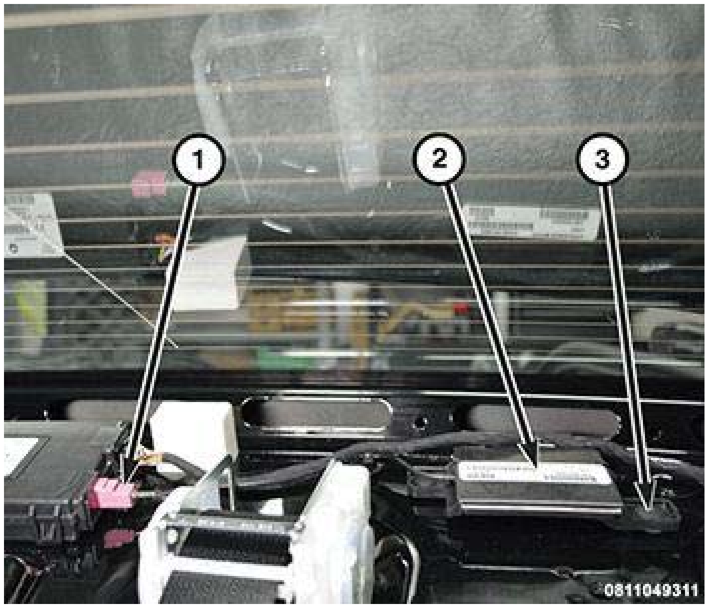

Fig. 9: Remote Frequency Hub Module (RFHM) Jump Wire, Remote Start Antenna Module & Push Tab
Courtesy of CHRYSLER GROUP, LLC

1. Position the Remote Start Antenna assembly (2) to the vehicle and install the push tab retainers (3).
2. Connect the electrical connectors at both the antenna module and the Remote Frequency Hub Module (RFHM) (1).
3. Connect the negative battery cable.
4. Connect the scan tool to the vehicle.
5. Perform the "Programming the RF-Hub" instructions. Refer to **STANDARD PROCEDURE** .
6. After programming the FOBIKs and the module, install the rear shelf cover. Refer to **PANEL, REAR SHELF, INSTALLATION** .
7. Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

NOTE: **Replace and Program the module(s) per the "RF-Hub, BCM, PCM, FOBIK and ELV Replacement and Programming Order Guide". Refer to STANDARD PROCEDURE .**

STARTER

REMOVAL

3.6L

1. Disconnect and isolate the negative battery cable at the battery.

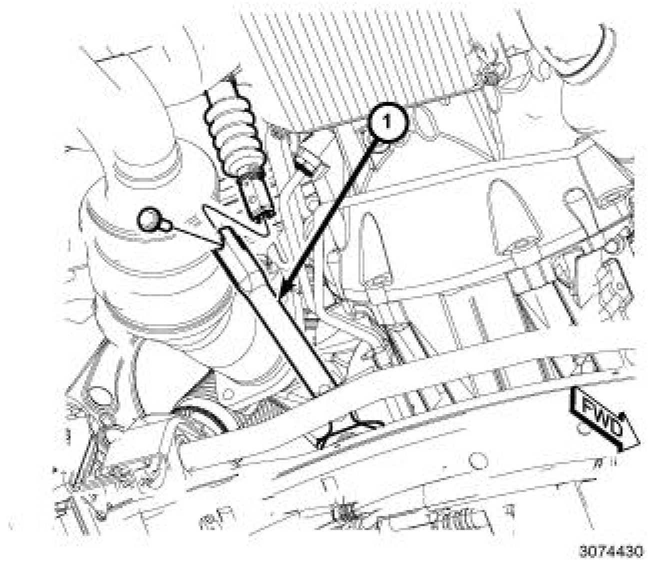

Fig. 10: Steering Gear Intermediate Shaft
Courtesy of CHRYSLER GROUP, LLC

2. Secure the steering wheel.
3. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
4. Disconnect the steering gear intermidiate shaft (1). Refer to **SHAFT, INTERMEDIATE, LOWER, REMOVAL** .

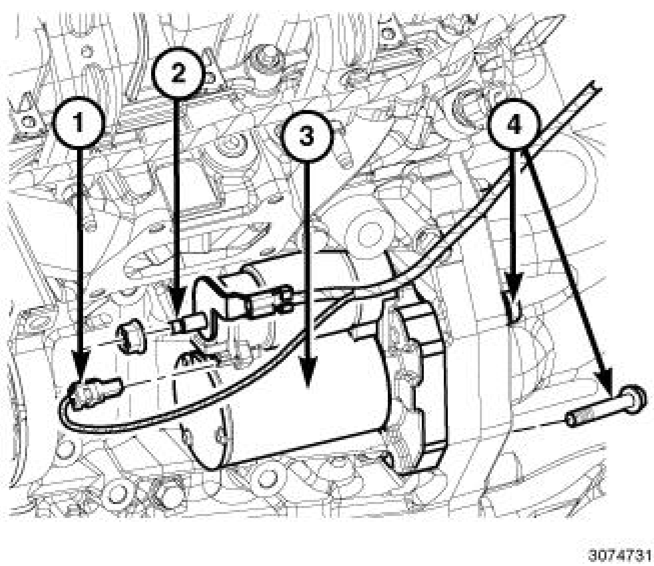

Fig. 11: Starter Solenoid Electrical Connector, Solenoid Stud, Starter Mounting Bolts & Starter Assembly
Courtesy of CHRYSLER GROUP, LLC

5. Remove the starter solenoid heat shield.
6. Disconnect the starter solenoid electrical connector (1) from the starter solenoid terminal.
7. Remove the battery cable nut and battery cable from the solenoid stud (2).
8. Remove the starter mounting bolts (4), the electrical harness mounting bracket should remain in position.

9. Rotate and remove the starter assembly (3) from the transmission.

5.7L / 6.4L WITH AUTO TRANS

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle.

Fig. 12: Electric Power Steering Harness Connector
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the electric power steering harness connector (1) in order to gain access to the starter wiring connections.
4. If equipped, remove the starter assembly heat shield.

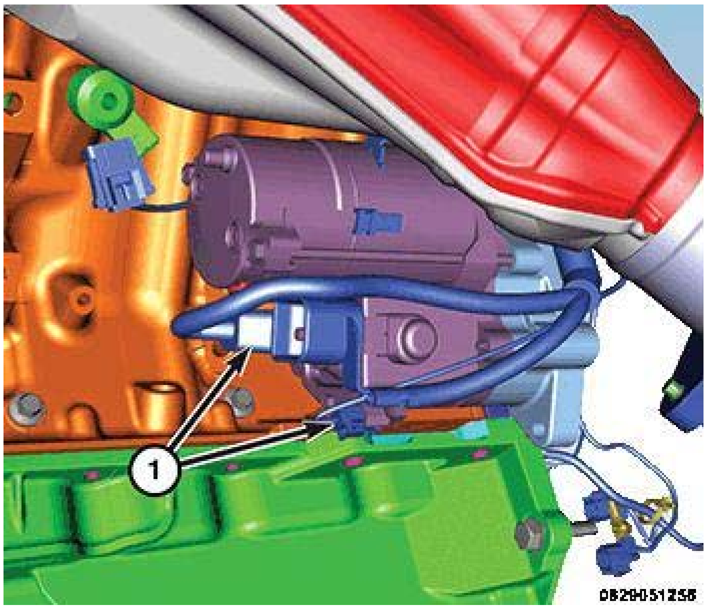

Fig. 13: Starter Connections
Courtesy of CHRYSLER GROUP, LLC

5. Remove the wiring harness connectors from the starter (1).

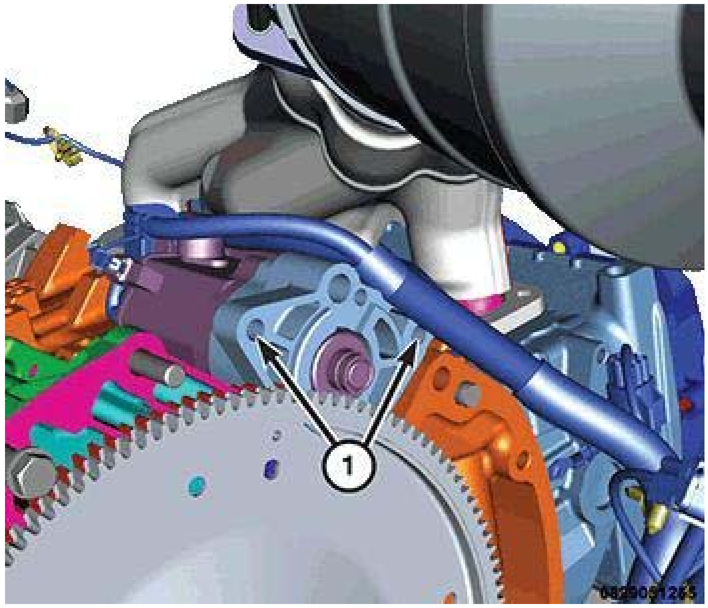

Fig. 14: Starter Mount To Transmission Bell Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Remove the two starter mount to transmission bell housing bolts (1).
7. Remove the starter motor.

5.7L / 6.4L WITH MAN TRANS

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle.

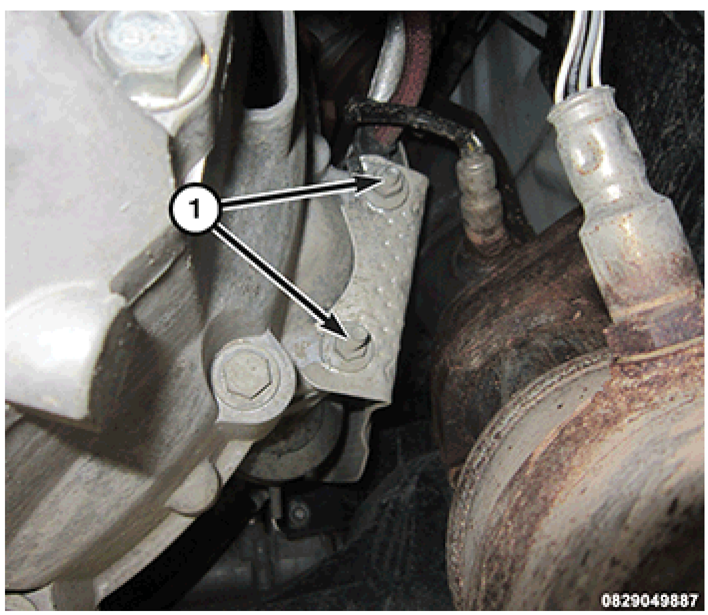

Fig. 15: Heat Shield Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Remove the heat shield (if equipped).

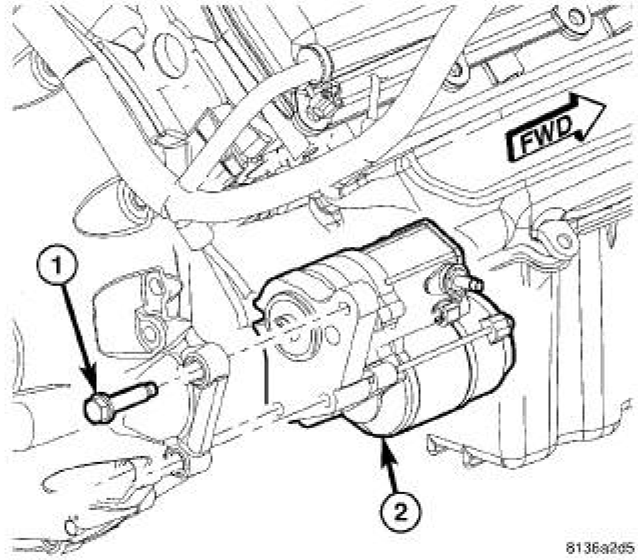

Fig. 16: Starter Mounting Bolt & Starter Motor
Courtesy of CHRYSLER GROUP, LLC

4. Remove the three starter mounting bolts (1).
5. Move the starter motor (2) towards front of vehicle far enough for nose of starter to clear. Always support starter motor (2) during this process. Do not let starter motor hang from wire harness.

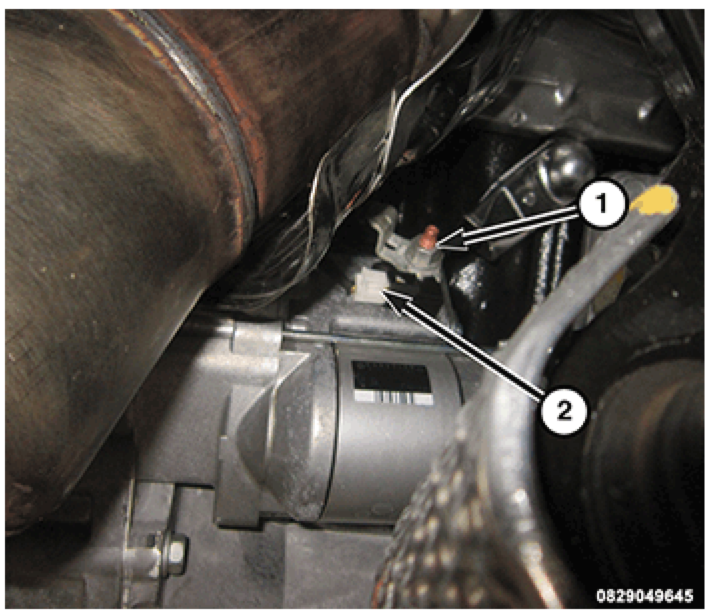

Fig. 17: Battery Cable-To-Solenoid Nut & Solenoid Stud
Courtesy of CHRYSLER GROUP, LLC

6. Remove the battery cable-to-solenoid nut (1).
7. Remove the solenoid wire from solenoid stud (2).
8. Remove the starter motor.

6.2L

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle.

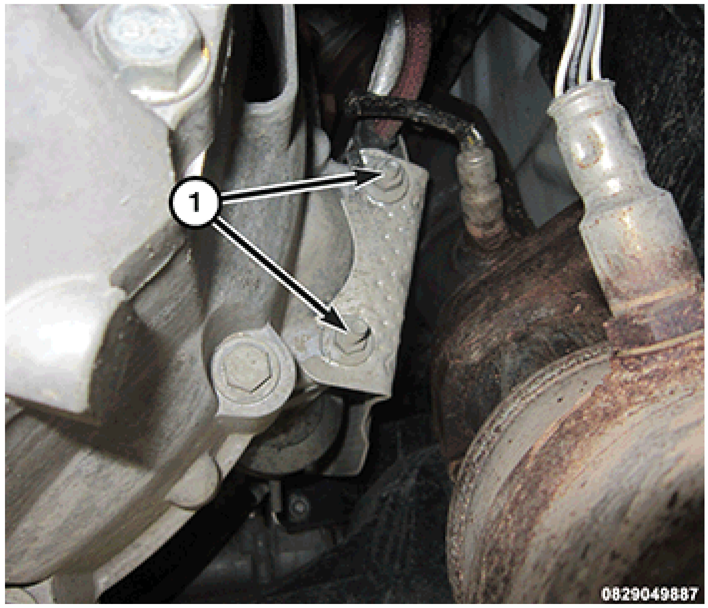

Fig. 18: Heat Shield Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Remove the two heat shield nuts (1) and remove the heat shield.

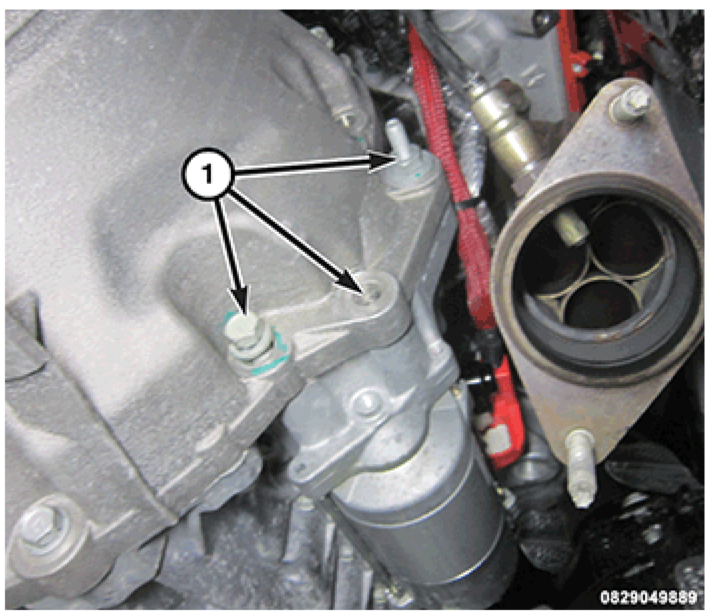

Fig. 19: Starter Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Remove the three starter mounting bolts (1).
5. Move the starter motor towards the front of vehicle far enough for the nose of starter to clear. Always support the starter motor during this process. Do not let the starter motor hang from the wire harness.

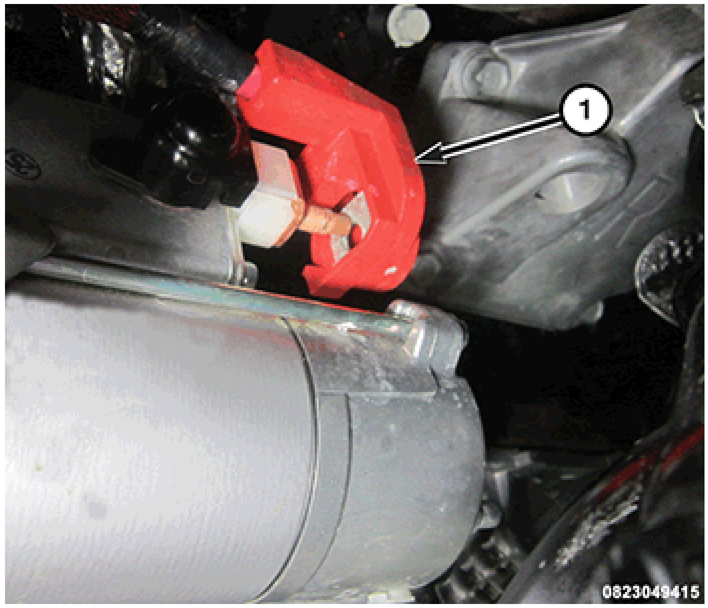

Fig. 20: Solenoid Wire
Courtesy of CHRYSLER GROUP, LLC

6. Remove the battery cable-to-solenoid nut (1).
7. Remove the solenoid wire (1) from the solenoid stud.
8. Remove the starter motor.

INSTALLATION

3.6L

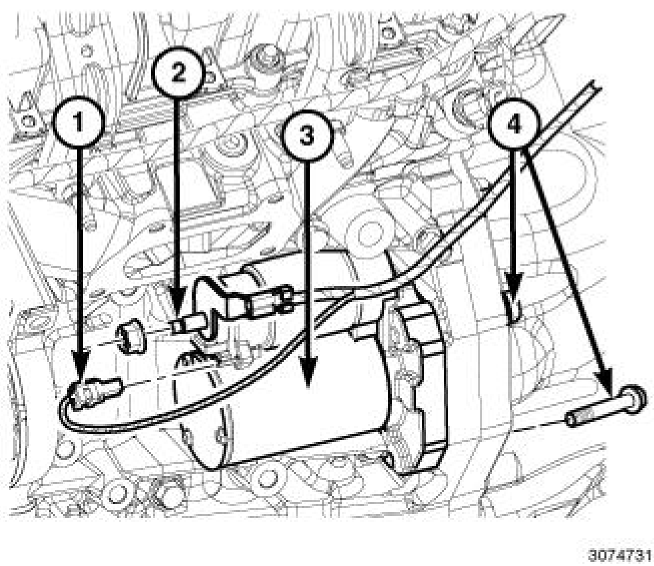

Fig. 21: Starter Solenoid Electrical Connector, Solenoid Stud, Starter Mounting Bolts & Starter Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Position the starter (3) inside the transmission.

2. Install the starter mounting bolts (4) and tighten to the proper torque specification. Refer to **SPECIFICATIONS**.
3. Connect the starter solenoid electrical connector (1) to starter solenoid terminal.
4. Install the battery cable and nut to the solenoid stud (2). Tighten to the proper torque specification. Refer to **SPECIFICATIONS**.
5. Install the starter solenoid heat shield. Tighten to the proper torque specification. Refer to **SPECIFICATIONS**.

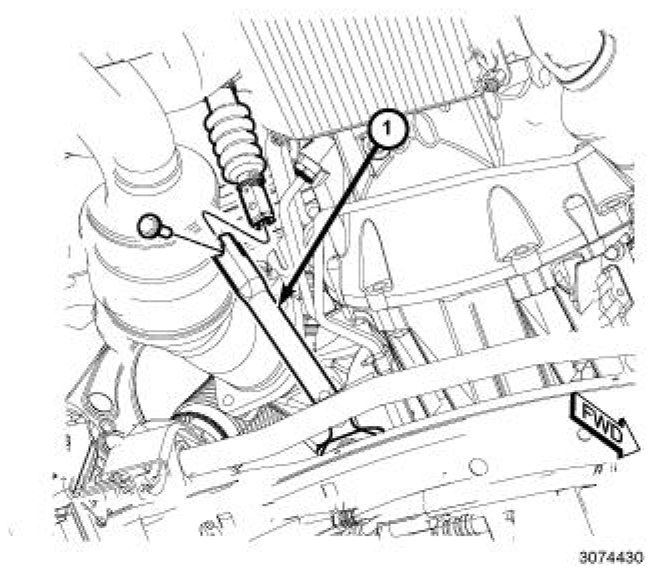

Fig. 22: Steering Gear Intermediate Shaft
Courtesy of CHRYSLER GROUP, LLC

6. Install the steering gear lower intermediate shaft (1). Refer to **SHAFT, INTERMEDIATE, LOWER, INSTALLATION** .
7. Remove the steering wheel holder.
8. Connect the negative battery cable and tighten to the proper torque specification. Refer to **SPECIFICATIONS**.

5.7L / 6.4L WITH AUTO TRANS

1. Position the starter into transmission but do not install bolts.

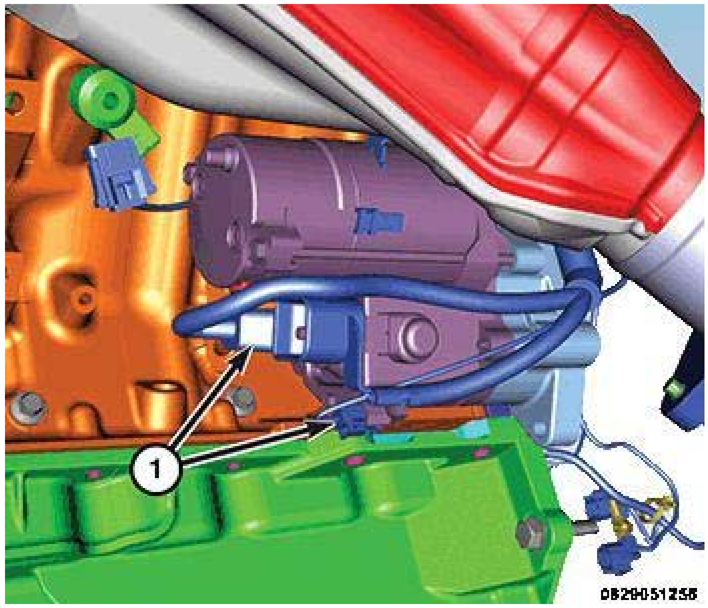

Fig. 23: Starter Connections
Courtesy of CHRYSLER GROUP, LLC

2. Connect the solenoid harness connector (1) to starter motor (snaps on). Tighten to the proper torque specification. Refer to **SPECIFICATIONS**.
3. Position the battery cable (1) to solenoid stud. Install and tighten the battery cable eyelet nut to the proper torque specification. Refer to **SPECIFICATIONS**. Do not allow the starter motor to hang from wire harness.

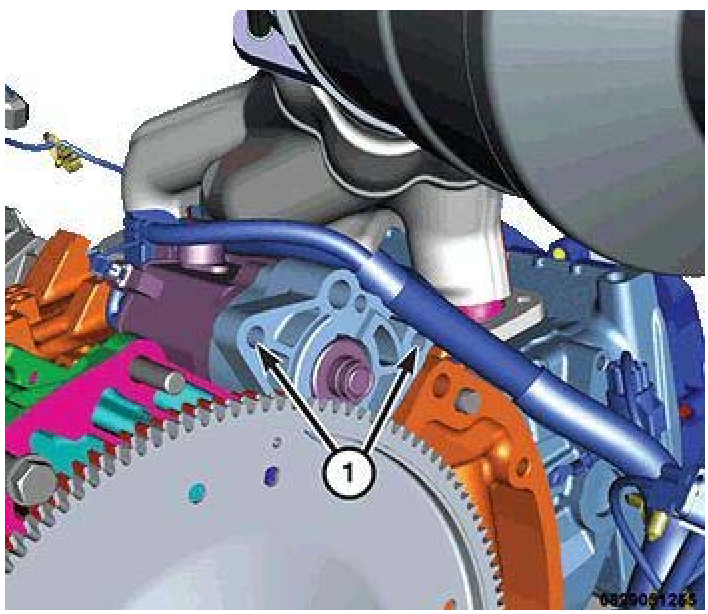

Fig. 24: Starter Mount To Transmission Bell Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Install and tighten two mounting bolts (1). Tighten to the proper torque specification. Refer to **SPECIFICATIONS**.
5. Install the starter heat shield (if equipped). Tighten to the proper torque specification. Refer to **SPECIFICATIONS**.

Fig. 25: Electric Power Steering Harness Connector
Courtesy of CHRYSLER GROUP, LLC

6. Connect the electronic power steering connector (1).
7. Connect the negative battery cable. Tighten to the proper torque specification. Refer to **SPECIFICATIONS**.

5.7L / 6.4L WITH MAN TRANS

1. Position the starter into the transmission but do not install bolts.

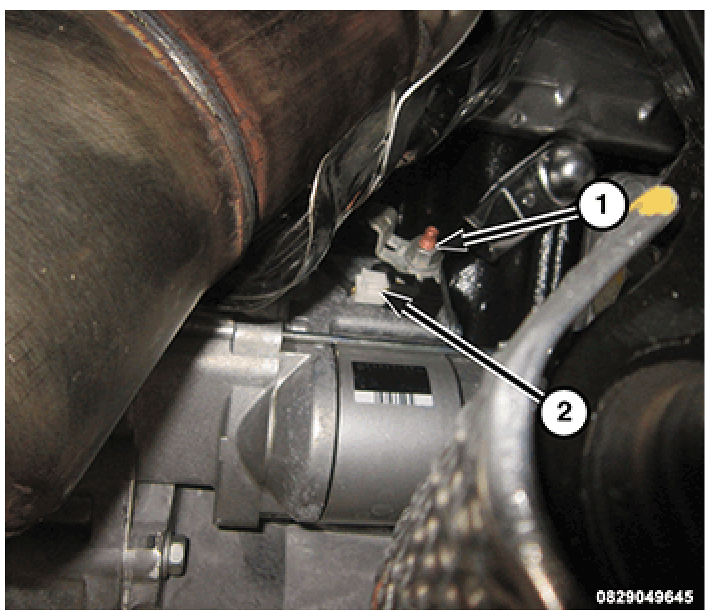

Fig. 26: Battery Cable-To-Solenoid Nut & Solenoid Stud
Courtesy of CHRYSLER GROUP, LLC

2. Connect the solenoid wire (2) to the starter motor (snaps on). Tighten to the proper torque specification. Refer to **SPECIFICATIONS**.
3. Position the battery cable to the solenoid stud (1). Install the battery cable eyelet nut.

Tighten to the proper torque specification. Refer to **SPECIFICATIONS**.

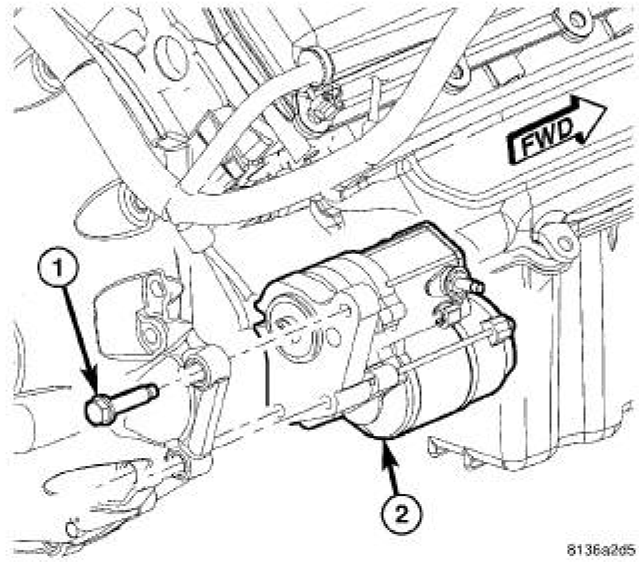

Fig. 27: Starter Mounting Bolt & Starter Motor
Courtesy of CHRYSLER GROUP, LLC

4. Install the three mounting bolts (1).

   Tighten to the proper torque specification. Refer to **SPECIFICATIONS**.

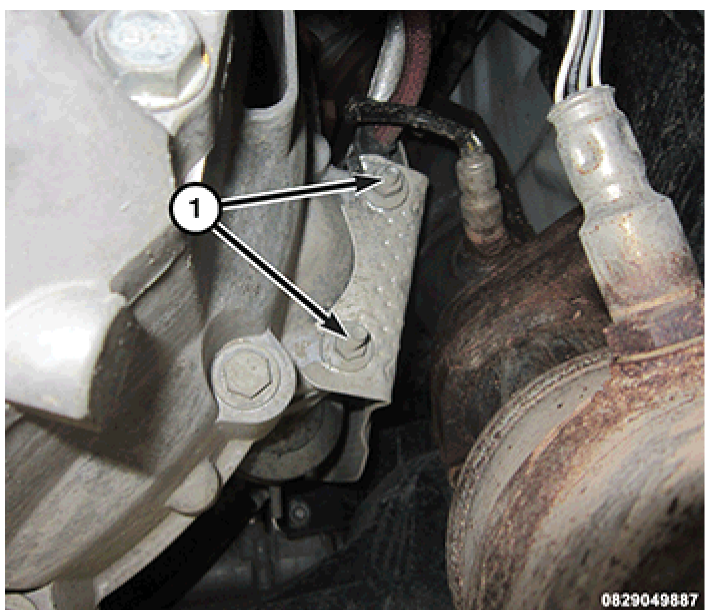

Fig. 28: Heat Shield Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Position the heat shield and install the two shield mounting nuts (1). Tighten to the proper torque specification. Refer to **SPECIFICATIONS**.
6. Connect the negative battery cable. Tighten to the proper torque specification. Refer to **SPECIFICATIONS**.

6.2L

1. Position the starter into the transmission but do not install bolts.
2. Connect the solenoid wire to the starter motor (snaps on).
3. Position the battery cable to the solenoid stud. Install the battery cable eyelet nut.

   Tighten to the proper torque specification. Refer to **SPECIFICATIONS**.

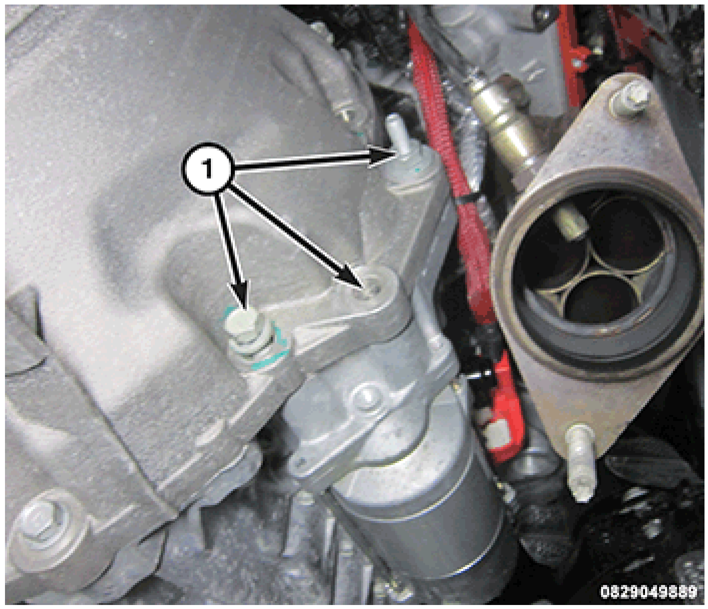

Fig. 29: Starter Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Install the three mounting bolts (1).

   Tighten to the proper torque specification. Refer to **SPECIFICATIONS**.

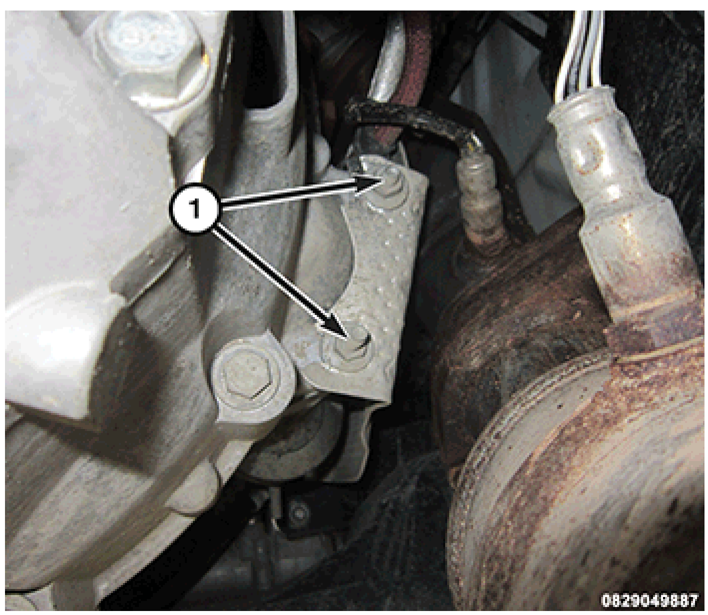

Fig. 30: Heat Shield Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Position the heat shield and install the two shield mounting nuts (1). Tighten to the proper torque specification. Refer to **SPECIFICATIONS**.
6. Connect the negative battery cable. Tighten to the proper torque specification. Refer to **SPECIFICATIONS**.

2015-16 GENERAL INFORMATION

Steering Column Control Module (SCCM) - Dodge Challenger

DIAGNOSTIC CODE INDEX

DIAGNOSTIC CODE INDEX

DTC	Description
B1D9C-00	STEERING COLUMN TILT SWITCH
B1D9C-2A	STEERING COLUMN TILT SWITCH - STUCK
B2225-00	(SCM) STEERING COLUMN MODULE INTERNAL
B2306-2A	FRONT WASHER SWITCH - STUCK
B23A1-2A	FLASH TO PASS/OPTICAL HORN SWITCH - STUCK
C1240-76	STEERING ANGLE SENSOR ANGLE OVERTRAVEL PERFORMANCE - WRONG MOUNTING POSITION
C2129-16	BATTERY VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD
C2129-17	BATTERY VOLTAGE - CIRCUIT VOLTAGE ABOVE THRESHOLD
C212A-16	SYSTEM VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD
C212A-17	SYSTEM VOLTAGE - CIRCUIT VOLTAGE ABOVE THRESHOLD
C2205-00	STEERING ANGLE SENSOR INTERNAL
C2205-29	STEERING ANGLE SENSOR INTERNAL - SIGNAL INVALID
C2205-2F	STEERING ANGLE SENSOR INTERNAL - SIGNAL ERRATIC
C2205-41	STEERING ANGLE SENSOR INTERNAL - GENERAL CHECKSUM FAILURE
C2205-96	STEERING ANGLE SENSOR INTERNAL - COMPONENT INTERNAL FAILURE
P0815-2A	UPSHIFT SWITCH - STUCK
P0816-2A	DOWNSHIFT SWITCH - STUCK
P0826-11	UP/DOWN SHIFT SWITCH - CIRCUIT SHORT TO GROUND
P0826-13	UP/DOWN SHIFT SWITCH - CIRCUIT OPEN
P0826-15	UP/DOWN SHIFT SWITCH - CIRCUIT SHORT TO BATTERY OR OPEN
U0002-00	CAN C BUS OFF PERFORMANCE
U0100-00	LOST COMMUNICATION WITH ECM/PCM
U0140-00	LOST COMMUNICATION WITH BODY CONTROL MODULE
U0155-00	LOST COMMUNICATION WITH CLUSTER-CCN
U0401-00	IMPLAUSIBLE DATA RECIEVED FROM ECM/PCM
U0422-00	IMPLAUSIBLE DATA RECIEVED FROM THE BODY CONTROL MODULE
U0423-00	IMPLAUSIBLE DATA RECEIVED FROM CLUSTER/CCN
U1008-00	LIN 1 BUS
U121E-00	LOST COMMUNICATION WITH STEERING WHEEL CRUISE CONTROL SWITCH

DTC TROUBLESHOOTING

B1D9C-00-STEERING COLUMN TILT SWITCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Steering Column Control Module (SCCM) is located near the top of the Steering Column underneath the Steering Wheel. The SCCM includes the Clockspring, the Multi-Function Switch and a LIN/CAN C Gateway. LIN Bus messages received by the LIN/CAN C Gateway are broadcast over the CAN C Bus to the appropriate modules.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The Battery voltage is between 7 and 17 volts.

SET CONDITION

- The Steering Column Control Module (SCCM) detects a Steering Column Power Tilt and Telescope Switch failure for greater than 50 milliseconds.

DEFAULT ACTION

- The Tilt and Telescope Switches will be inactive.

POSSIBLE CAUSES

Possible Causes
STEERING COLUMN CONTROL MODULE (SCCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read Steering Column Control Module (SCCM) DTCs and record on the repair order.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read SCCM DTCs.

    Did the DTC return?

    Yes

    - Go to 2

    No

- The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension. If no problems are found, test complete.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK RELATED HARNESS CONNECTIONS**
   1. Disconnect all SCCM Module harness connectors.
   2. Disconnect all related in-line harness connections (if equipped).
   3. Disconnect the related component harness connectors.
   4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
      - Proper connector installation.
      - Damaged connector locks.
      - Corrosion.
      - Other signs of water intrusion.
      - Weather seal damage (if equipped).
      - Bent terminals.
      - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
      - Terminals that have been pushed back into the connector cavity.
      - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

      Repair any conditions that are found.
   5. Reconnect all SCCM Module harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
   6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
   7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
   8. With the scan tool, erase DTCs.
   9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
   10. With the scan tool, read SCCM Module DTCs.

       Did the DTC return?

       Yes

       - Replace the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to **MODULE, STEERING COLUMN CONTROL, REMOVAL** .
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
- Test complete.

B1D9C-2A-STEERING COLUMN TILT SWITCH - STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Steering Column Control Module (SCCM) is located near the top of the Steering Column underneath the Steering Wheel. The SCCM includes the Clockspring, the Multi-Function Switch and a LIN/CAN C Gateway. LIN Bus messages received by the LIN/CAN C Gateway are broadcast over the CAN C Bus to the appropriate modules.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The Battery voltage is between 7 and 17 volts.

SET CONDITION

- The Steering Column Control Module (SCCM) detects the Steering Column Power Tilt and Telescope Switch has been active for greater than 50 seconds.

DEFAULT ACTION

- The Tilt and Telescope Switches will be inactive.

POSSIBLE CAUSES

Possible Causes
STEERING COLUMN TILT SWITCH STUCK
STEERING COLUMN CONTROL MODULE (SCCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read Steering Column Control Module (SCCM) DTCs and record on the repair order.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read SCCM DTCs.

    Did the DTC return?

Yes

- Check the Steering Column Tilt Switch for any debris that could cause a sticking or stuck switch. If no problem is found, refer to 2.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension. If no problems are found, test complete.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK RELATED HARNESS CONNECTIONS**
    1. Disconnect all SCCM Module harness connectors.
    2. Disconnect all related in-line harness connections (if equipped).
    3. Disconnect the related component harness connectors.
    4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
        - Proper connector installation.
        - Damaged connector locks.
        - Corrosion.
        - Other signs of water intrusion.
        - Weather seal damage (if equipped).
        - Bent terminals.
        - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
        - Terminals that have been pushed back into the connector cavity.
        - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

       Repair any conditions that are found.
    5. Reconnect all SCCM Module harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
    6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
    7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
    8. With the scan tool, erase DTCs.
    9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    10. With the scan tool, read SCCM Module DTCs.

Did the DTC return?

Yes

- Replace the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to **MODULE, STEERING COLUMN CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
- Test complete.

B2225-00-(SCM) STEERING COLUMN MODULE INTERNAL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Steering Column Control Module (SCCM) is located near the top of the Steering Column underneath the Steering Wheel. The SCCM includes the Clockspring, the Multi-Function Switch and a LIN/CAN C Gateway. LIN Bus messages received by the LIN/CAN C Gateway are broadcast over the CAN C Bus to the appropriate modules.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The Battery voltage is between 7 and 17 volts.

SET CONDITION

- The Steering Column Control Module (SCCM) detects a Steering Angle Sensor (SAS) failure.

POSSIBLE CAUSES

Possible Causes
LOW BATTERY VOLTAGE
STEERING COLUMN CONTROL MODULE (SCCM)

DIAGNOSTIC TEST

1. **CHECK FOR CHARGING OR VOLTAGE RELATED DTC(S)**
    1. With the scan tool, read PCM DTCs and record on the repair order.

       Are there any charging system or battery voltage related DTCs present?

       Yes

       - Repair the Powertrain Control Module (PCM) DTCs before continuing with this test. Refer

to **DTC INDEX** .

-

No

- Go To 2

2. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read Steering Column Control Module (SCCM) DTCs and record on the repair order.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read SCCM DTCs.

    Did the DTC return?

    Yes

    - Go to 3

    No

    - The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension. If no problems are found, test complete.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK RELATED HARNESS CONNECTIONS**
    1. Disconnect all SCCM Module harness connectors.
    2. Disconnect all related in-line harness connections (if equipped).
    3. Disconnect the related component harness connectors.
    4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
        - Proper connector installation.
        - Damaged connector locks.
        - Corrosion.
        - Other signs of water intrusion.
        - Weather seal damage (if equipped).
        - Bent terminals.
        - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
        - Terminals that have been pushed back into the connector cavity.

- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all SCCM Module harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read SCCM Module DTCs.

Did the DTC return?

Yes

- Replace the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to **MODULE, STEERING COLUMN CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
- Test complete.

B2306-2A-FRONT WASHER SWITCH - STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Steering Column Control Module (SCCM) is located near the top of the Steering Column underneath the Steering Wheel. The SCCM includes the Clockspring, the Multi-Function Switch and a LIN/CAN C Gateway. LIN Bus messages received by the LIN/CAN C Gateway are broadcast over the CAN C Bus to the appropriate modules.

The Right Hand (RH) Multifunction Switch provides a Front Wiper Washer Switch signal to the Steering Column Control Module (SCCM). The SCCM sends the Front Wiper Washer Switch signal to the Body Control Module (BCM) through the LIN 3 Bus circuit. When the BCM receives the Front Wiper Washer Switch signal from the SCCM, the BCM activates the Front Wiper Washer Pump.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.

SET CONDITION

- The Steering Column Control Module (SCCM) detects the Washer Switch has been active for greater than 20 seconds.
- Battery voltage is between 7 and 17 volts.

DEFAULT ACTION

- The Washer Switch will be inactive.

POSSIBLE CAUSES

Possible Causes
FRONT WASHER SWITCH STUCK
STEERING COLUMN CONTROL MODULE (SCCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read Steering Column Control Module (SCCM) DTCs and record on the repair order.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read SCCM DTCs.

       Did the DTC return?

       Yes

       - Go to 2

       No

       - The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension. If no problems are found, test complete.
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK RELATED HARNESS CONNECTIONS**
    1. Disconnect all SCCM Module harness connectors.
    2. Disconnect all related in-line harness connections (if equipped).
    3. Disconnect the related component harness connectors.
    4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
        - Proper connector installation.

- Damaged connector locks.
- Corrosion.
- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all SCCM Module harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read SCCM Module DTCs.

Did the DTC return?

Yes

- Replace the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to **MODULE, STEERING COLUMN CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
- Test complete.

B23A1-2A-FLASH TO PASS/OPTICAL HORN SWITCH - STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Steering Column Control Module (SCCM) is located near the top of the Steering Column underneath the Steering Wheel. The SCCM includes the Clockspring, the Multi-Function Switch and a LIN/CAN C Gateway. LIN Bus messages received by the LIN/CAN C Gateway are broadcast over the CAN C Bus to the appropriate modules.

The LH Multifunction Switch provides Flash to Pass/Optical Horn Switch signals to the Steering Column Control Module (SCCM). The SCCM sends the requested signal to the Body Control Module (BCM) through the LIN 3 Bus circuit.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The Battery voltage is between 7 and 17 volts.

SET CONDITION

- The Steering Column Control Module (SCCM) detects the Flash To Pass/Optical Horn Switch has been active for greater than 20 seconds.

DEFAULT ACTION

- The Flash To Pass/Optical Horn Switch will be inactive.

POSSIBLE CAUSES

Possible Causes
STEERING COLUMN CONTROL MODULE (SCCM)
FLASH TO PASS/OPTICAL HORN SWITCH STUCK

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read Steering Column Control Module (SCCM) DTCs and record on the repair order.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read SCCM DTCs.

    Did the DTC return?

    Yes

    - Go to 2

    No

    - The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension. If no problems are found, test complete.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK RELATED HARNESS CONNECTIONS**
   1. Disconnect all SCCM Module harness connectors.
   2. Disconnect all related in-line harness connections (if equipped).
   3. Disconnect the related component harness connectors.
   4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
      - Proper connector installation.
      - Damaged connector locks.
      - Corrosion.
      - Other signs of water intrusion.
      - Weather seal damage (if equipped).
      - Bent terminals.
      - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
      - Terminals that have been pushed back into the connector cavity.
      - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

      Repair any conditions that are found.
   5. Reconnect all SCCM Module harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
   6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
   7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
   8. With the scan tool, erase DTCs.
   9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
   10. With the scan tool, read SCCM Module DTCs.

      Did the DTC return?

      Yes

      - Replace the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to **MODULE, STEERING COLUMN CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
      - Test complete.

C1240-76-STEERING ANGLE SENSOR ANGLE OVERTRAVEL PERFORMANCE - WRONG MOUNTING POSITION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Steering Column Control Module (SCCM) is located near the top of the Steering Column underneath the Steering Wheel. The SCCM includes the Clockspring, the Multi-Function Switch and a LIN/CAN C Gateway. LIN Bus messages received by the LIN/CAN C Gateway are broadcast over the CAN C Bus to the appropriate modules.

The Steering Angle Sensor (SAS) for this vehicle is integral to the Steering Column Control Module (SCCM).

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- The Steering Column Control Module (SCCM) detects an incorrect installation of the Steering Angle Sensor (SAS).

DEFAULT ACTION

- The SAS will be inactive.

POSSIBLE CAUSES

Possible Causes
INCORRECT STEERING ANGLE SENSOR (SAS) INSTALLATION
STEERING COLUMN CONTROL MODULE (SCCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

NOTE: **If steering system service has been performed and the Steering Angle Sensor (SAS) has been installed incorrectly, this DTC may set. Refer to the Service Information to verify repairs have been performed correctly.**

1. With the scan tool, read Steering Column Control Module (SCCM) DTCs and record on the repair order.
2. Record the Environmental Data and any DTCs.
3. With the scan tool, erase DTCs.
4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
5. With the scan tool, read SCCM DTCs.

   Did the DTC return?

Yes

- Go to 2

No

- The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension. If no problems are found, test complete.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK RELATED HARNESS CONNECTIONS**
    1. Disconnect all SCCM Module harness connectors.
    2. Disconnect all related in-line harness connections (if equipped).
    3. Disconnect the related component harness connectors.
    4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
        - Proper connector installation.
        - Damaged connector locks.
        - Corrosion.
        - Other signs of water intrusion.
        - Weather seal damage (if equipped).
        - Bent terminals.
        - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
        - Terminals that have been pushed back into the connector cavity.
        - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

        Repair any conditions that are found.
    5. Reconnect all SCCM Module harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
    6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
    7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
    8. With the scan tool, erase DTCs.
    9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    10. With the scan tool, read SCCM Module DTCs.

        Did the DTC return?

        Yes

- Replace the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to **MODULE, STEERING COLUMN CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
- Test complete.

C2129-16-BATTERY VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Steering Column Control Module (SCCM) is located near the top of the Steering Column underneath the Steering Wheel. The SCCM includes the Clockspring, the Multi-Function Switch and a LIN/CAN C Gateway. LIN Bus messages received by the LIN/CAN C Gateway are broadcast over the CAN C Bus to the appropriate modules.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- The Steering Column Control Module (SCCM) detects the voltage is below 10 volts for greater than 15 seconds.

DEFAULT ACTION

- All switch outputs will be inactive.

POSSIBLE CAUSES

Possible Causes
CHARGING OR VOLTAGE DTCS PRESENT
LOW BATTERY VOLTAGE
STEERING COLUMN CONTROL MODULE (SCCM)

DIAGNOSTIC TEST

1. **CHECK FOR CHARGING OR VOLTAGE RELATED DTC(S) PRESENT IN OTHER MODULES**
    1. With the scan tool, read the PCM DTCs and record on the repair order.

       Are there any charging system or battery voltage related DTCs present?

       Yes

       - Repair the Powertrain Control Module (PCM) DTCs before continuing with this test. Refer

to **DTC INDEX** .

-

No

- Go To 2

2. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read Steering Column Control Module (SCCM) DTCs and record on the repair order.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read SCCM DTCs.

    Did the DTC return?

    Yes

    - Go to 3

    No

    - The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension. If no problems are found, test complete.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK RELATED HARNESS CONNECTIONS**
    1. Disconnect all SCCM Module harness connectors.
    2. Disconnect all related in-line harness connections (if equipped).
    3. Disconnect the related component harness connectors.
    4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
        - Proper connector installation.
        - Damaged connector locks.
        - Corrosion.
        - Other signs of water intrusion.
        - Weather seal damage (if equipped).
        - Bent terminals.
        - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
        - Terminals that have been pushed back into the connector cavity.

- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all SCCM Module harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read SCCM Module DTCs.

Did the DTC return?

Yes

- Replace the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to **MODULE, STEERING COLUMN CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
- Test complete.

C2129-17-BATTERY VOLTAGE - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Steering Column Control Module (SCCM) is located near the top of the Steering Column underneath the Steering Wheel. The SCCM includes the Clockspring, the Multi-Function Switch and a LIN/CAN C Gateway. LIN Bus messages received by the LIN/CAN C Gateway are broadcast over the CAN C Bus to the appropriate modules.

WHEN MONITORED

- This diagnostic runs continuously when the Engine is on.

SET CONDITION

- The Steering Column Control Module (SCCM) detects the voltage is above 16 volts for greater than 15 seconds.

DEFAULT ACTION

- All switch outputs will be inactive.

POSSIBLE CAUSES

Possible Causes
CHARGING OR VOLTAGE DTCS PRESENT
HIGH BATTERY VOLTAGE
STEERING COLUMN CONTROL MODULE (SCCM)

DIAGNOSTIC TEST

1. **CHECK FOR CHARGING OR VOLTAGE RELATED DTC(S) PRESENT IN OTHER MODULES**
    1. Start the Engine.
    2. With the scan tool, read the PCM DTCs and record on the repair order.

       Are there any charging system or battery voltage related DTCs present?

       Yes

       - Repair the Powertrain Control Module (PCM) DTCs before continuing with this test. Refer to **DTC INDEX** .
       -

       No

       - Go To 2
2. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read Steering Column Control Module (SCCM) DTCs and record on the repair order.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read SCCM DTCs.

       Did the DTC return?

       Yes

       - Go to 3

       No

       - The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension. If no problems are found, test complete.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK RELATED HARNESS CONNECTIONS**
    1. Disconnect all SCCM Module harness connectors.
    2. Disconnect all related in-line harness connections (if equipped).
    3. Disconnect the related component harness connectors.
    4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
        - Proper connector installation.
        - Damaged connector locks.
        - Corrosion.
        - Other signs of water intrusion.
        - Weather seal damage (if equipped).
        - Bent terminals.
        - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
        - Terminals that have been pushed back into the connector cavity.
        - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

        Repair any conditions that are found.
    5. Reconnect all SCCM Module harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
    6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
    7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
    8. With the scan tool, erase DTCs.
    9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    10. With the scan tool, read SCCM Module DTCs.

        Did the DTC return?

        Yes

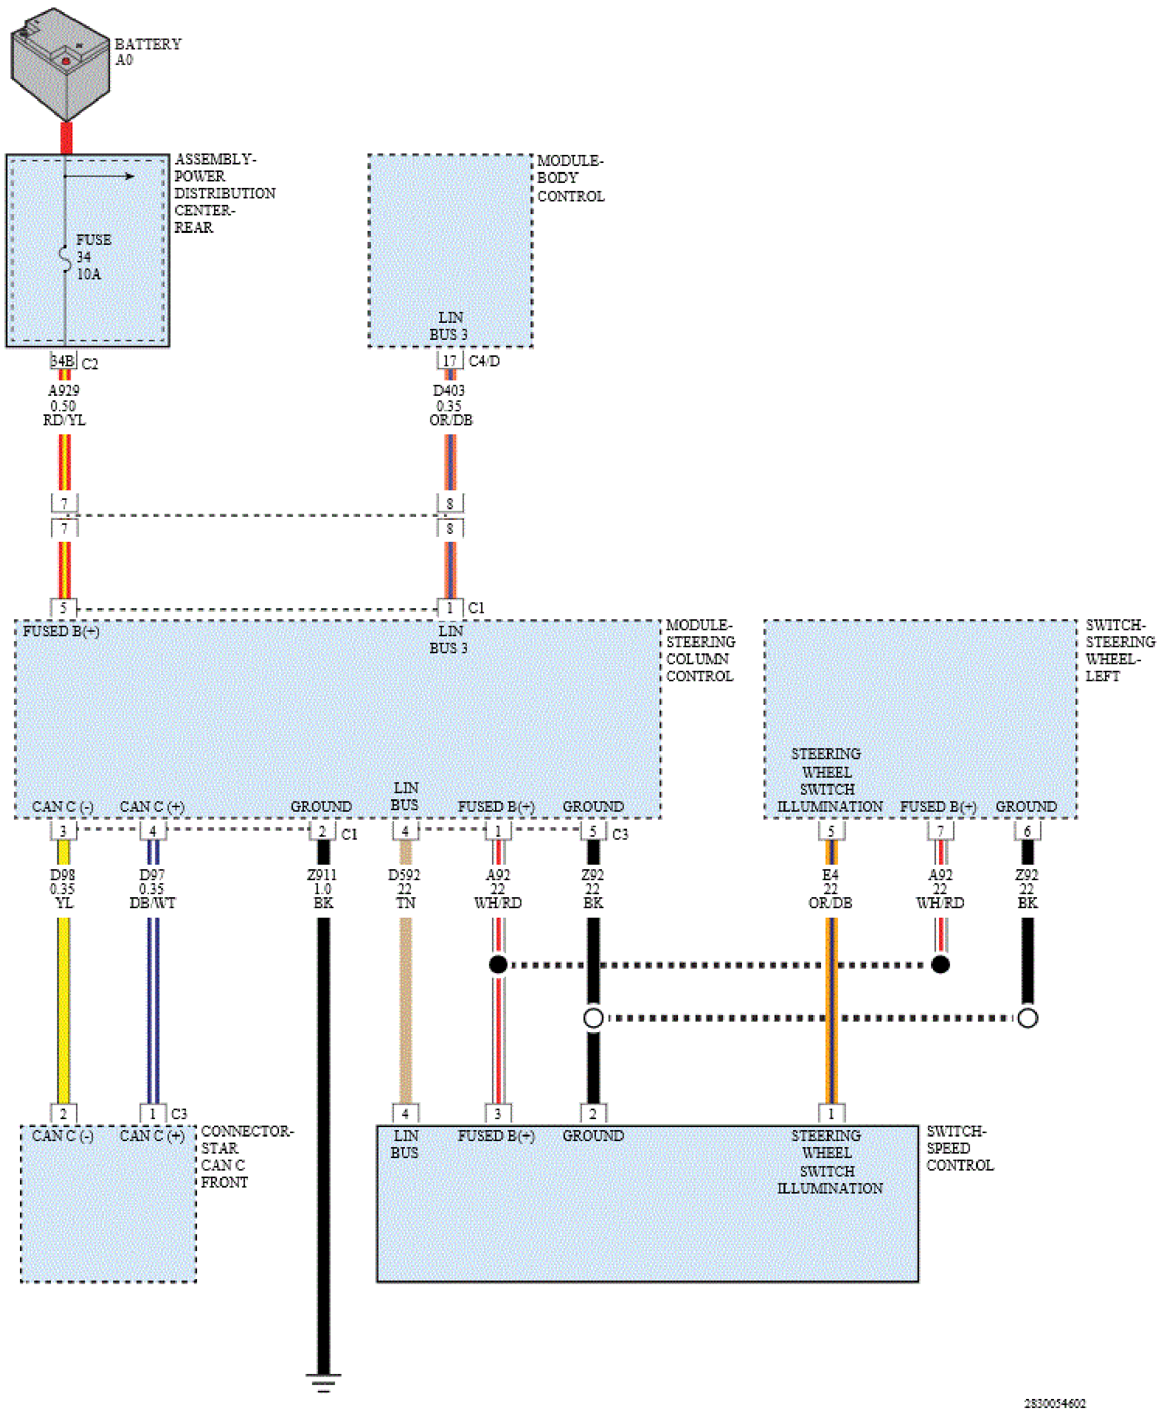
        - Replace the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to **MODULE, STEERING COLUMN CONTROL, REMOVAL** .
        - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

        No

        - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
        - Test complete.

C212A-16-SYSTEM VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .



[Fig. 1: Steering Column Control Module Circuit Diagram]
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Steering Column Control Module (SCCM) is located near the top of the Steering Column underneath the Steering Wheel. The SCCM includes the Clockspring, the Multi-Function Switch and a LIN/CAN C Gateway. LIN Bus messages received by the LIN/CAN C Gateway are broadcast over the CAN C Bus to the appropriate

modules.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- The Steering Column Control Module (SCCM) internal power supply is below 10 volts for more than 15 seconds.

DEFAULT ACTION

- All switch outputs will be inactive.

POSSIBLE CAUSES

Possible Causes
CHARGING OR VOLTAGE DTCS PRESENT
LOW BATTERY VOLTAGE
FUSED B(+) CIRCUIT OPEN OR EXCESSIVE RESISTANCE
GROUND CIRCUIT OPEN OR EXCESSIVE RESISTANCE
STEERING COLUMN CONTROL MODULE (SCCM)

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTC(S) PRESENT IN PCM**
    1. With the scan tool, read the Powertrain Control Module (PCM) DTCs and record on the repair order.

       Are there any charging system or related battery voltage DTCs present?

       Yes

       - Perform the appropriate Charging System DTC diagnostic procedures before continuing with this test. Refer to **DTC INDEX** .

       No

       - Go To 2
2. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read Steering Column Control Module (SCCM) DTCs and record on the repair order.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read SCCM DTCs.

Did the DTC return?

Yes

- Go To 3

No

- The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension. If no problems are found, test complete.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (A929) FUSED B(+) CIRCUIT FOR VOLTAGE**
    1. Turn the ignition off.
    2. Disconnect the Steering Control Module C1 harness connector.
    3. Turn the ignition on.
    4. Measure the voltage of the (A929) Fused B(+) circuit.

    Is voltage above 10 volts?

    Yes

    - Go To 4

    No

    - Repair the (A929) Fused B(+) circuit for an open.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE CONTINUITY OF THE (Z912) GROUND CIRCUIT**
    1. Turn the ignition off.
    2. Check for continuity between ground and the (Z912) Ground circuit at the Steering Control Module C1 harness connector.

    Is there continuity between ground and the (Z912) Ground circuit?

    Yes

    - Go to 5

    No

    - Repair the (Z912) Ground circuit for an open.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
5. **CHECK RELATED HARNESS CONNECTIONS**
    1. Disconnect all SCCM Module harness connectors.
    2. Disconnect all related in-line harness connections (if equipped).

3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
    - Proper connector installation.
    - Damaged connector locks.
    - Corrosion.
    - Other signs of water intrusion.
    - Weather seal damage (if equipped).
    - Bent terminals.
    - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
    - Terminals that have been pushed back into the connector cavity.
    - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

    Repair any conditions that are found.

5. Reconnect all SCCM Module harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read SCCM Module DTCs.

    Did the DTC return?

    Yes

    - Replace the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to **MODULE, STEERING COLUMN CONTROL, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
    - Test complete.

   3. Disconnect the related component harness connectors.
   4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
      - Proper connector installation.
      - Damaged connector locks.
      - Corrosion.
      - Other signs of water intrusion.
      - Weather seal damage (if equipped).
      - Bent terminals.
      - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
      - Terminals that have been pushed back into the connector cavity.
      - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

      Repair any conditions that are found.

   5. Reconnect all SCCM Module harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
   6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
   7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
   8. With the scan tool, erase DTCs.
   9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
   10. With the scan tool, read SCCM Module DTCs.

Did the DTC return?

Yes

- Replace the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to **MODULE, STEERING COLUMN CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
- Test complete.

C2205-00-STEERING ANGLE SENSOR INTERNAL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Steering Column Control Module (SCCM) is located near the top of the Steering Column underneath the Steering Wheel. The SCCM includes the Clockspring, the Multi-Function Switch and a LIN/CAN C Gateway. LIN Bus messages received by the LIN/CAN C Gateway are broadcast over the CAN C Bus to the appropriate modules.

The Steering Angle Sensor (SAS) for this vehicle is integral to the Steering Column Control Module (SCCM).

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- The Steering Column Control Module (SCCM) detects the Steering Angle Sensor (SAS) has set an internal failure.

DEFAULT ACTION

- The SAS will be inactive.

POSSIBLE CAUSES

Possible Causes
STEERING COLUMN CONTROL MODULE (SCCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read Steering Column Control Module (SCCM) DTCs and record on the repair order.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.

4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
5. With the scan tool, read SCCM DTCs.

   Did the DTC return?

   Yes

   - Go to 2

   No

   - The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension. If no problems are found, test complete.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK RELATED HARNESS CONNECTIONS**
   1. Disconnect all SCCM Module harness connectors.
   2. Disconnect all related in-line harness connections (if equipped).
   3. Disconnect the related component harness connectors.
   4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
      - Proper connector installation.
      - Damaged connector locks.
      - Corrosion.
      - Other signs of water intrusion.
      - Weather seal damage (if equipped).
      - Bent terminals.
      - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
      - Terminals that have been pushed back into the connector cavity.
      - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

      Repair any conditions that are found.

   5. Reconnect all SCCM Module harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
   6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
   7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
   8. With the scan tool, erase DTCs.
   9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions

above, operate the vehicle in the conditions that set the DTC.

10. With the scan tool, read SCCM Module DTCs.

    Did the DTC return?

    Yes

    - Replace the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to **MODULE, STEERING COLUMN CONTROL, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
    - Test complete.

C2205-29-STEERING ANGLE SENSOR INTERNAL - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Steering Column Control Module (SCCM) is located near the top of the Steering Column underneath the Steering Wheel. The SCCM includes the Clockspring, the Multi-Function Switch and a LIN/CAN C Gateway. LIN Bus messages received by the LIN/CAN C Gateway are broadcast over the CAN C Bus to the appropriate modules.

The Steering Angle Sensor (SAS) for this vehicle is integral to the Steering Column Control Module (SCCM).

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- The Steering Column Control Module (SCCM) detects the Steering Angle Sensor (SAS) has set an internal failure.

DEFAULT ACTION

- The SAS will be inactive.

POSSIBLE CAUSES

Possible Causes
STEERING COLUMN CONTROL MODULE (SCCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read Steering Column Control Module (SCCM) DTCs and record on the repair

order.

2. Record the Environmental Data and any DTCs.
3. With the scan tool, erase DTCs.
4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
5. With the scan tool, read SCCM DTCs.

   Did the DTC return?

   Yes

   - Go to 2

   No

   - The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension. If no problems are found, test complete.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK RELATED HARNESS CONNECTIONS**
   1. Disconnect all SCCM Module harness connectors.
   2. Disconnect all related in-line harness connections (if equipped).
   3. Disconnect the related component harness connectors.
   4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
      - Proper connector installation.
      - Damaged connector locks.
      - Corrosion.
      - Other signs of water intrusion.
      - Weather seal damage (if equipped).
      - Bent terminals.
      - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
      - Terminals that have been pushed back into the connector cavity.
      - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

      Repair any conditions that are found.

   5. Reconnect all SCCM Module harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
   6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
   7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated

and the connector locks are fully engaged.

8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read SCCM Module DTCs.

Did the DTC return?

Yes

- Replace the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to **MODULE, STEERING COLUMN CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
- Test complete.

C2205-2F-STEERING ANGLE SENSOR INTERNAL - SIGNAL ERRATIC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Steering Column Control Module (SCCM) is located near the top of the Steering Column underneath the Steering Wheel. The SCCM includes the Clockspring, the Multi-Function Switch and a LIN/CAN C Gateway. LIN Bus messages received by the LIN/CAN C Gateway are broadcast over the CAN C Bus to the appropriate modules.

The Steering Angle Sensor (SAS) for this vehicle is integral to the Steering Column Control Module (SCCM).

    1. Disconnect all SCCM Module harness connectors.
    2. Disconnect all related in-line harness connections (if equipped).
    3. Disconnect the related component harness connectors.
    4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
        - Proper connector installation.
        - Damaged connector locks.
        - Corrosion.
        - Other signs of water intrusion.
        - Weather seal damage (if equipped).
        - Bent terminals.
        - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
        - Terminals that have been pushed back into the connector cavity.
        - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

        Repair any conditions that are found.
    5. Reconnect all SCCM Module harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
    6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully

seated and the connector locks are fully engaged.

7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read SCCM Module DTCs.

Did the DTC return?

Yes

- Replace the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to **MODULE, STEERING COLUMN CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
- Test complete.

C2205-41-STEERING ANGLE SENSOR INTERNAL - GENERAL CHECKSUM FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Steering Column Control Module (SCCM) is located near the top of the Steering Column underneath the Steering Wheel. The SCCM includes the Clockspring, the Multi-Function Switch and a LIN/CAN C Gateway. LIN Bus messages received by the LIN/CAN C Gateway are broadcast over the CAN C Bus to the appropriate modules.

The Steering Angle Sensor (SAS) for this vehicle is integral to the Steering Column Control Module (SCCM).

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- The Steering Column Control Module (SCCM) detects the Steering Angle Sensor (SAS) has set an internal failure.

DEFAULT ACTION

- The SAS will be inactive.

POSSIBLE CAUSES

Possible Causes

Possible Causes
STEERING COLUMN CONTROL MODULE (SCCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read Steering Column Control Module (SCCM) DTCs and record on the repair order.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read SCCM DTCs.

    Did the DTC return?

    Yes

    - Go to 2

    No

    - The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension. If no problems are found, test complete.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK RELATED HARNESS CONNECTIONS**
    1. Disconnect all SCCM Module harness connectors.
    2. Disconnect all related in-line harness connections (if equipped).
    3. Disconnect the related component harness connectors.
    4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
        - Proper connector installation.
        - Damaged connector locks.
        - Corrosion.
        - Other signs of water intrusion.
        - Weather seal damage (if equipped).
        - Bent terminals.
        - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
        - Terminals that have been pushed back into the connector cavity.
        - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all SCCM Module harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read SCCM Module DTCs.

    Did the DTC return?

    Yes

    - Replace the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to **MODULE, STEERING COLUMN CONTROL, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
    - Test complete.

C2205-96-STEERING ANGLE SENSOR INTERNAL - COMPONENT INTERNAL FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Steering Column Control Module (SCCM) is located near the top of the Steering Column underneath the Steering Wheel. The SCCM includes the Clockspring, the Multi-Function Switch and a LIN/CAN C Gateway. LIN Bus messages received by the LIN/CAN C Gateway are broadcast over the CAN C Bus to the appropriate modules.

The Steering Angle Sensor (SAS) for this vehicle is integral to the Steering Column Control Module (SCCM).

WHEN MONITORED

- The SAS will be inactive.

POSSIBLE CAUSES

Possible Causes
STEERING COLUMN CONTROL MODULE (SCCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read Steering Column Control Module (SCCM) DTCs and record on the repair order.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read SCCM DTCs.

        Did the DTC return?

        Yes

        - Go to 2

        No

        - The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension. If no problems are found, test complete.
        - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK RELATED HARNESS CONNECTIONS**
    1. Disconnect all SCCM Module harness connectors.
    2. Disconnect all related in-line harness connections (if equipped).
    3. Disconnect the related component harness connectors.
    4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
        - Proper connector installation.
        - Damaged connector locks.
        - Corrosion.
        - Other signs of water intrusion.
        - Weather seal damage (if equipped).
        - Bent terminals.
        - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).

- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all SCCM Module harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read SCCM Module DTCs.

Did the DTC return?

Yes

- Replace the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to **MODULE, STEERING COLUMN CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
- Test complete.

P0815-2A-UPSHIFT SWITCH - STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Paddle Shifters are integral to the Remote Radio Switches. The Paddle Shifters in the two remote radio switch units are normally open MUX switches that are hard wired to the Right Steering Wheel Switch (Speed Control Switch). The right steering wheel switch (speed control switch) provides a five volt signal and return circuit to the switches. Both switches share the signal and return circuits. The Right Steering Wheel Switch senses the status of the switches by reading the voltage drop of the signal circuit.

When the Right Steering Wheel Switch senses an input (voltage drop) from any one of the Paddle Shifters, it communicates the switch status message to the Steering Column Control Module (SCCM) through the LIN Bus (through the Clockspring). The SCCM then broadcasts the switch status information over the CAN Bus to the Transmission Control Module (TCM) communicating the request for Transmission upshift or downshift.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The Battery voltage is between 7 and 17 volts.

SET CONDITION

- The Steering Column Control Module (SCCM) detects the Upshift Paddle Shift Switch has been active for greater than 20 seconds.

DEFAULT ACTION

- The Upshift Paddle Shift Switch will be inactive.

POSSIBLE CAUSES

Possible Causes
UPSHIFT PADDLE SHIFT SWITCH STUCK
UPSHIFT PADDLE SHIFT SWITCH

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read the Steering Column Control Module (SCCM) DTCs and record on the repair order.

       Is the DTC active?

       Yes

       - Go To 2

       No

       - The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. If no problems are found, test complete.
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE UPSHIFT PADDLE SHIFT SWITCH**
    1. With the scan tool, view the Upshift Paddle Shift Switch status.
    2. While monitoring the Upshift Paddle Shift Switch status, actuate the switch multiple times.

       Does the scan tool display the correct status of the switch in the data display?

       Yes

       - Replace the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to **MODULE, STEERING COLUMN CONTROL, REMOVAL** .
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Verify all connections between the Downshift Paddle Shift Switch and the SCCM are properly made, properly seated and verify proper pin terminal tension. If no problems are found, replace the Upshift Paddle Shift Switch in accordance with the Service Information. Refer to **SWITCH, REMOTE RADIO, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P0816-2A-DOWNSHIFT SWITCH - STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Paddle Shifters are integral to the Remote Radio Switches. The Paddle Shifters in the two remote radio switch units are normally open MUX switches that are hard wired to the Right Steering Wheel Switch (Speed Control Switch). The right steering wheel switch (speed control switch) provides a five volt signal and return circuit to the switches. Both switches share the signal and return circuits. The Right Steering Wheel Switch senses the status of the switches by reading the voltage drop of the signal circuit.

When the Right Steering Wheel Switch senses an input (voltage drop) from any one of the Paddle Shifters, it communicates the switch status message to the Steering Column Control Module (SCCM) through the LIN Bus (through the Clockspring). The SCCM then broadcasts the switch status information over the CAN Bus to the Transmission Control Module (TCM) communicating the request for Transmission upshift or downshift.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The Battery voltage is between 7 and 17 volts.

SET CONDITION

- The Steering Column Control Module (SCCM) detects the Downshift Paddle Shift Switch has been active for greater than 20 seconds.

DEFAULT ACTION

- The Downshift Paddle Shift Switch will be inactive.

Possible Causes
DOWNSHIFT PADDLE SHIFT SWITCH STUCK
DOWNSHIFT PADDLE SHIFT SWITCH

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read the Steering Column Control Module (SCCM) DTCs and record on the

repair order.

Is the DTC active?

Yes

- Go To 2

No

- The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. If no problems are found, test complete.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE DOWNSHIFT PADDLE SHIFT SWITCH**
    1. With the scan tool, view the Downshift Paddle Shift Switch status.
    2. While monitoring the Downshift Paddle Shift Switch status, actuate the switch multiple times.

    Does the scan tool display the correct status of the switch in the data display?

    Yes

    - Replace the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to **MODULE, STEERING COLUMN CONTROL, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Verify all connections between the Downshift Paddle Shift Switch and the SCCM are properly made, properly seated and verify proper pin terminal tension. If no problems are found, replace the Downshift Paddle Shift Switch in accordance with the Service Information. Refer to **SWITCH, REMOTE RADIO, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P0826-11-UP/DOWN SHIFT SWITCH - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Paddle Shifters are integral to the Remote Radio Switches. The Paddle Shifters in the two remote radio switch units are normally open MUX switches that are hard wired to the Right Steering Wheel Switch (Speed Control Switch). The right steering wheel switch (speed control switch) provides a five volt signal and return circuit to the switches. Both switches share the signal and return circuits. The Right Steering Wheel Switch senses the status of the switches by reading the voltage drop of the signal circuit.

When the Right Steering Wheel Switch senses an input (voltage drop) from any one of the Paddle Shifters, it communicates the switch status message to the Steering Column Control Module (SCCM) through the LIN Bus

(through the Clockspring). The SCCM then broadcasts the switch status information over the CAN Bus to the Transmission Control Module (TCM) communicating the request for Transmission upshift or downshift.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The Battery voltage is between 7 and 17 volts.

SET CONDITION

- The Steering Column Control Module (SCCM) detects one of the Paddle Shift Switch circuits is shorted to ground for greater than 40 milliseconds.

DEFAULT ACTION

- The Paddle Shift Switches will be inactive.

POSSIBLE CAUSES

Possible Causes
PADDLE SHIFT SWITCH SIGNAL CIRCUIT SHORTED TO GROUND
LEFT OR RIGHT PADDLE SHIFT SWITCHES
STEERING COLUMN CONTROL MODULE (SCCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read the Steering Column Control Module (SCCM) DTCs and record on the repair order.

       Is the DTC active?

       Yes

       - Go To 2

       No

       - The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. If no problems are found, test complete.
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE WIRING HARNESS**
    1. Turn the ignition off.
    2. Disconnect the Upshift and Downshift Paddle Shift Switches.
    3. Visually and physically inspect the wiring harness between the Upshift and Downshift Paddle Shift

Switch harness connectors and the Steering Column Control Module (SCCM) harness connector for any damaged wires, connectors, and open/spread terminals.

Were any problems found?

Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE UPSHIFT PADDLE SHIFT SWITCH**
    1. Reconnect the Downshift Paddle Shift Switch.
    2. Turn the ignition on.
    3. With the scan tool, erase the SCCM DTCs.
    4. Cycle the ignition switch from off to on.
    5. With the scan tool, read the SCCM DTCs.

NOTE: **Other DTCs may set in the SCCM and the Radio. Disregard any other DTCs that may set.**

Did the DTC return?

Yes

- Go To 4

No

- Replace the Upshift Paddle Shift Switch in accordance with the Service Information. Refer to **SWITCH, REMOTE RADIO, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE DOWNSHIFT PADDLE SHIFT SWITCH**
    1. Turn the ignition off.
    2. Reconnect the Upshift Paddle Shift Switch.
    3. Disconnect the Downshift Paddle Shift Switch.
    4. Turn the ignition on.
    5. With the scan tool, erase the SCCM DTCs.
    6. Cycle the ignition switch from off to on.
    7. With the scan tool, read the SCCM DTCs.

Did the DTC return?

Yes

- Replace the Steering Column Control Module (SCCM). Refer to **MODULE, STEERING COLUMN CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Downshift Paddle Shift Switch in accordance with the Service Information. Refer to **SWITCH, REMOTE RADIO, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P0826-13-UP/DOWN SHIFT SWITCH - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Paddle Shifters are integral to the Remote Radio Switches. The Paddle Shifters in the two remote radio switch units are normally open MUX switches that are hard wired to the Right Steering Wheel Switch (Speed Control Switch). The right steering wheel switch (speed control switch) provides a five volt signal and return circuit to the switches. Both switches share the signal and return circuits. The Right Steering Wheel Switch senses the status of the switches by reading the voltage drop of the signal circuit.

When the Right Steering Wheel Switch senses an input (voltage drop) from any one of the Paddle Shifters, it communicates the switch status message to the Steering Column Control Module (SCCM) through the LIN Bus (through the Clockspring). The SCCM then broadcasts the switch status information over the CAN Bus to the Transmission Control Module (TCM) communicating the request for Transmission upshift or downshift.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The Battery voltage is between 7 and 17 volts.

U0002-00-CAN C BUS OFF PERFORMANCE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0100-00-LOST COMMUNICATION WITH ECM/PCM

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0155-00-LOST COMMUNICATION WITH CLUSTER-CCN

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0401-00-IMPLAUSIBLE DATA RECIEVED FROM ECM/PCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- With the ignition on for at least five seconds.
- Battery voltage between 10 and 16 volts.
- Body Control Module (BCM) is configured correctly.

SET CONDITION

- When the communication data sent over the CAN BUS from the Powertrain Control Module (PCM) is missing part of the message or the message is an irrational value for at least three message attempts.

POSSIBLE CAUSES

Possible Causes
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BODY CONTROL MODULE (BCM) NOT CONFIGURED CORRECTLY
POWERTRAIN CONTROL MODULE (PCM) POWERS OR GROUNDS
POWERTRAIN CONTROL MODULE (PCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read the Steering Column Control Module (SCCM) DTCs and record on the repair order.

   Is the DTC active?

   Yes

   - Go To 2

   No

   - Perform the STORED LOST COMMUNICATION DTCS diagnostic procedure. Refer to **STORED LOST COMMUNICATION DTCS** .

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read all active DTCs from all modules.

   NOTE: Check for BCM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

   Does the scan tool display any active DTCs to the conditions listed above?

   Yes

   - Go to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

   No

   - Go To 3

3. **VERIFY THE PCM IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the PCM is active on the bus.

   Is the PCM active on the bus?

   Yes

   - Go To 4

   No

   - Perform the NO RESPONSE FROM PCM (POWERTRAIN CONTROL MODULE) diagnostic procedure. Refer to **NO RESPONSE FROM PCM (POWERTRAIN CONTROL MODULE) -- GAS** .

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

1. With the scan tool, read all the DTCs.

   Is there more than one module with active DTCs "Logged Against" the PCM?

   Yes

   - Replace/update the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Testing & Diagnostics article in Engine Performance .

   No

   - Go To 5

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the PCM.
   2. With the scan tool, erase the DTCs.

      Did the DTC return?

      Yes

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - The condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. If no problems are found, test Complete.
      - Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0422-00-IMPLAUSIBLE DATA RECIEVED FROM THE BODY CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- With the ignition on for at least five seconds.
- Battery voltage between 10 and 16 volts.
- Body Control Module (BCM) is configured correctly.

SET CONDITION

- When the communication data sent over the CAN BUS from the BCM is missing part of the message or the message is an irrational value for at least three message attempts.

POSSIBLE CAUSES

Possible Causes
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BODY CONTROL MODULE (BCM) NOT CONFIGURED CORRECTLY
BODY CONTROL MODULE (BCM) POWERS OR GROUNDS
BODY CONTROL MODULE (BCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: **Make sure the battery voltage is between 10 and 16 volts before proceeding.**

   1. With the scan tool, read the Steering Column Control Module (SCCM) DTCs and record on the repair order.

      Is the DTC active?

      Yes

      - Go To 2

      No

      - Perform the STORED LOST COMMUNICATION DTCS diagnostic procedure. Refer to **STORED LOST COMMUNICATION DTCS** .

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read all active DTCs from all modules.

      NOTE: **Check for BCM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.**

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Go to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3

3. **VERIFY THE BCM IS ACTIVE ON THE BUS**
    1. Turn the ignition on.
    2. With the scan tool, verify the BCM is active on the bus.

    Is the BCM active on the bus?

    Yes

    - Go To 4

    No

    - Perform the NO RESPONSE FROM BCM (BODY CONTROL MODULE) diagnostic procedure. Refer to **NO RESPONSE FROM BCM (BODY CONTROL MODULE)** .
4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
    1. With the scan tool, read all the DTCs.

    Is there more than one module with active DTCs "Logged Against" the BCM?

    Yes

    - Replace/update the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Go To 5
5. **CLEAR DTC IN MODULE SETTING FAULT**
    1. With the scan tool, select the module setting the DTC against the BCM.
    2. With the scan tool, erase the DTCs.

    Did the DTC return?

    Yes

    - Replace/update the module that set this DTC in accordance with the Service Information.
    - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Test complete. The condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD**

PROCEDURE .

U0423-00 IMPLAUSIBLE DATA RECEIVED FROM CLUSTER/CCN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- With the ignition on for at least five seconds.
- Battery voltage between 10 and 16 volts.
- Body Control Module (BCM) is configured correctly.

SET CONDITION

- When the communication data sent over the CAN BUS from the Instrument Cluster (IC) is missing part of the message or the message is an irrational value for at least three message attempts.

POSSIBLE CAUSES

Possible Causes
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
INSTRUMENT CLUSTER (IC) POWERS OR GROUNDS
INSTRUMENT CLUSTER
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read the Steering Column Control Module (SCCM) DTCs and record on the repair order.

      Is the DTC active?

      Yes

      - Go To 2

      No

      - Perform the STORED LOST COMMUNICATION DTCS diagnostic procedure. Refer to **STORED LOST COMMUNICATION DTCS** .

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

1. With the scan tool, read all active DTCs from all modules.

NOTE: **Check for BCM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.**

Does the scan tool display any active DTCs to the conditions listed above?

Yes

- Go to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

No

- Go To 3

3. **VERIFY THE INSTRUMENT CLUSTER (IC) IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the IC is active on the bus.

   Is the IC active on the bus?

   Yes

   - Go To 4

   No

   - Perform the NO RESPONSE FROM IC (INSTRUMENT CLUSTER) diagnostic procedure. Refer to **NO RESPONSE FROM IPC (INSTRUMENT PANEL CLUSTER)** .

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

   Is there more than one module with active DTCs "Logged Against" the IC?

   Yes

   - Replace/update the Instrument Cluster (IC) in accordance with the Service Information. Refer to **REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 5

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the IC.
   2. With the scan tool, erase the DTCs.

   Did the DTC return?

   Yes

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- The condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1008-00-LIN 1 BUS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

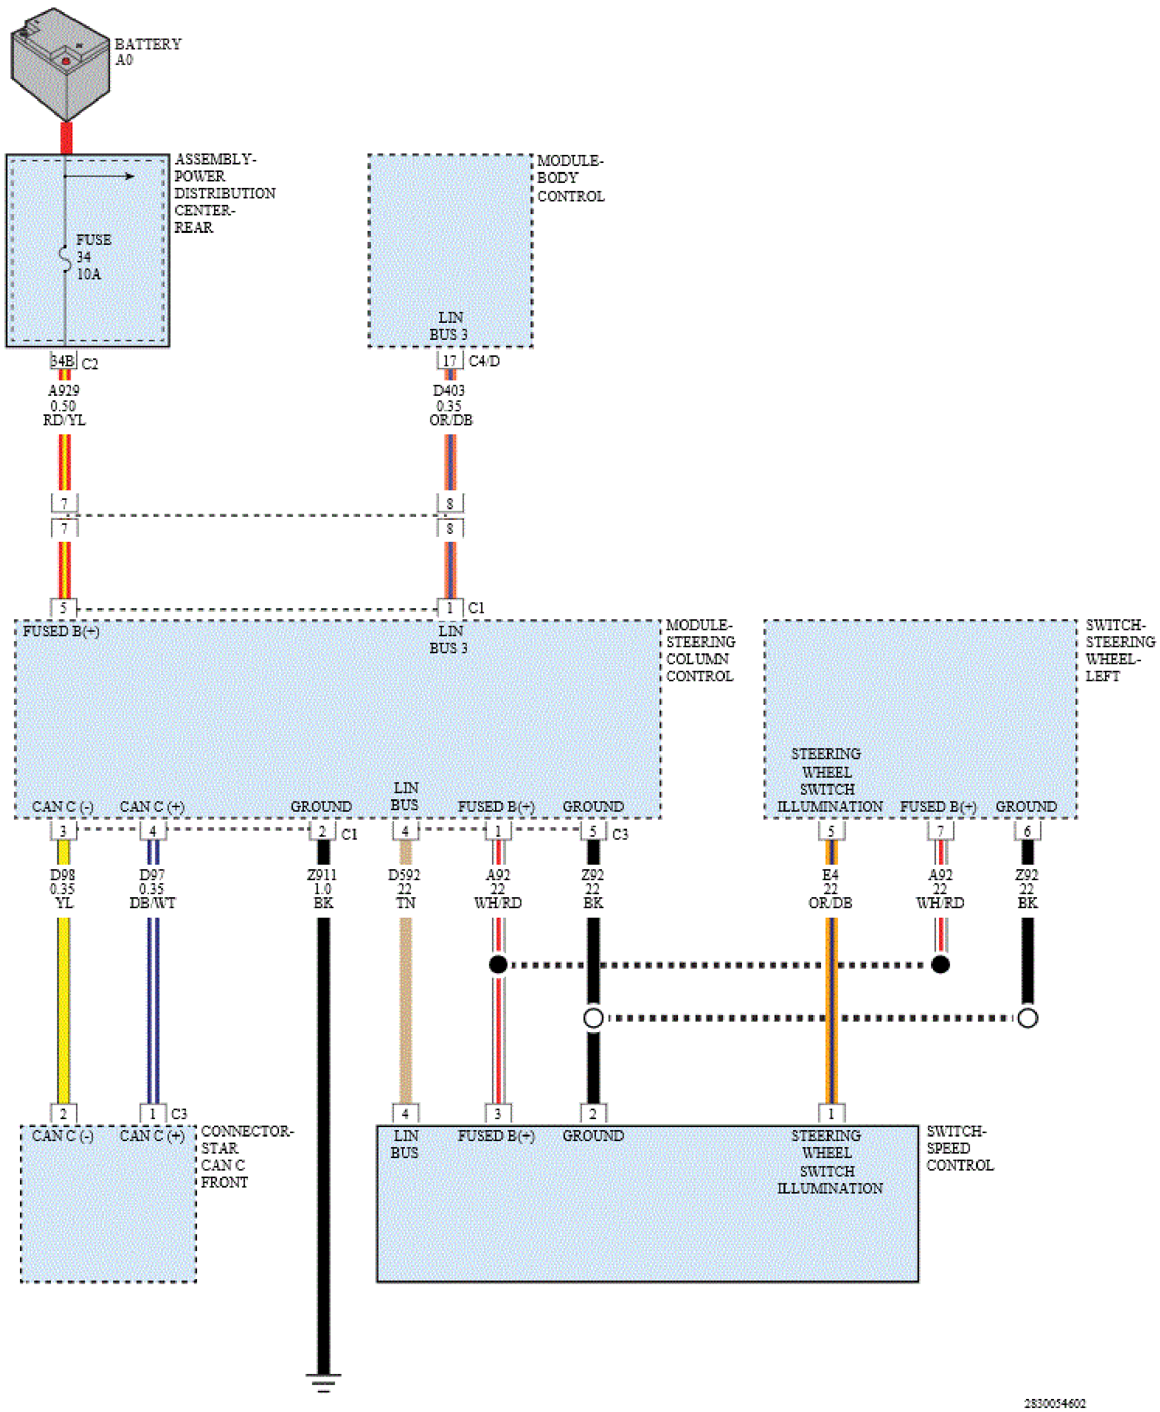

Fig. 2: Steering Column Control Module Circuit Diagram

Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Steering Column Control Module (SCCM) is located near the top of the Steering Column underneath the Steering Wheel. The SCCM includes the Clockspring, the Multi-Function Switch and a LIN/CAN C Gateway. LIN Bus messages received by the LIN/CAN C Gateway are broadcast over the CAN C Bus to the appropriate modules.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The Battery voltage is between 10 and 16 volts.

SET CONDITION

- The Steering Column Control Module (SCCM) detects a short on the LIN Bus circuit for greater than five seconds.

DEFAULT ACTION

- The Cruise Control Switches will be inactive.

POSSIBLE CAUSES

Possible Causes
LIN BUS CIRCUIT SHORTED TO VOLTAGE
LIN BUS CIRCUIT SHORTED TO GROUND
RIGHT STEERING WHEEL SWITCH (SPEED CONTROL)
STEERING COLUMN CONTROL SWITCH (SCCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read the Steering Column Control Module (SCCM) DTCs and record on the repair order.

        Is the DTC active?

        Yes

        - Go To 2

        No

        - The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension. If no problems are found, test complete.
2. **CHECK THE RIGHT STEERING WHEEL SWITCH**
    1. Turn the ignition off.
    2. Disconnect the Right Steering Wheel Switch (Speed Control) harness connector.
    3. Turn the ignition on.
    4. With the scan tool, read the DTCs

        Is this DTC active?

        Yes

- Go To 3

No

- Replace the Right Steering Wheel Switch (Speed Control Switch) in accordance to the Service Information. Refer to **SWITCH, SPEED CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (D592) LIN BUS CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Measure the voltage between ground and the (D592) LIN Bus circuit at the Right Steering Wheel Switch harness connector.

       Is there any voltage present?

       Yes

       - Repair the (D592) LIN Bus circuit for a short to voltage.
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

       No

       - Go To

         Refer to 4.

4. **CHECK THE (D592) LIN BUS CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off.
    2. Disconnect the Steering Column Control Module (SCCM) C3 harness connector.
    3. Check for continuity between ground and the (D592) LIN Bus circuit at the SCCM C3 harness connector.

       Is there continuity between ground and the (D592) LIN Bus circuit?

       Yes

       - Repair the (D592) LIN Bus circuit for a short to ground.
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

       No

       - Replace the Steering Column Control Module (SCCM) in accordance to the Service Information. Refer to **MODULE, STEERING COLUMN CONTROL, REMOVAL** .

U121E-00-LOST COMMUNICATION WITH STEERING WHEEL CRUISE CONTROL SWITCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

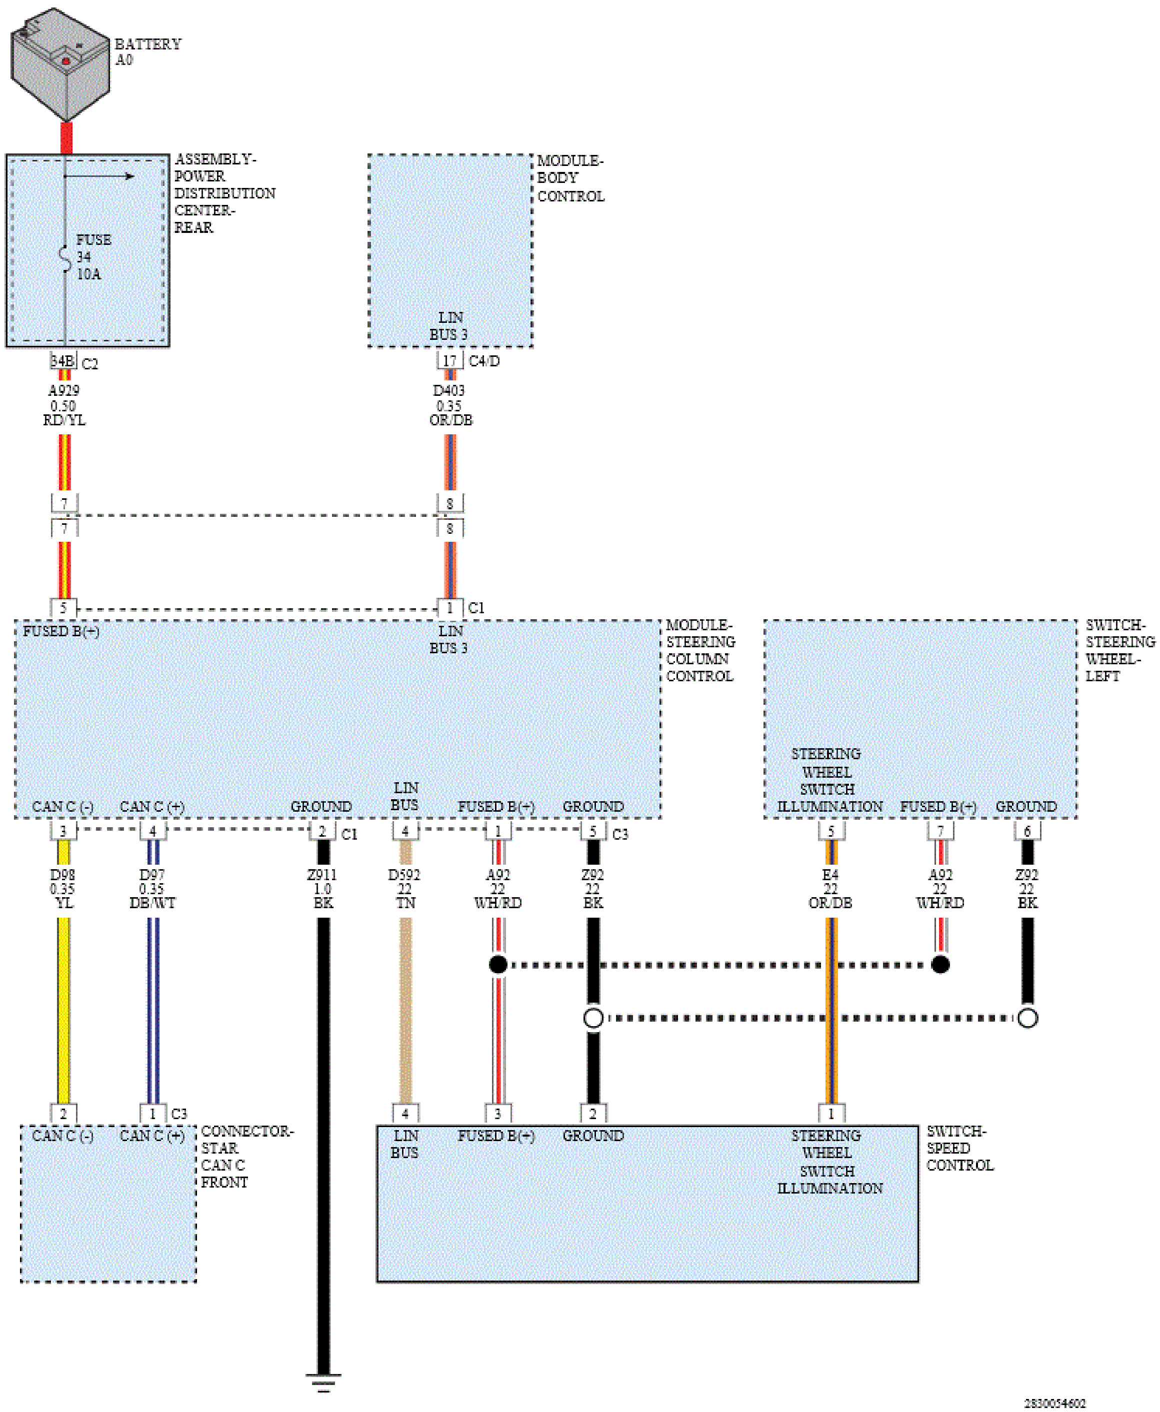

Fig. 3: Steering Column Control Module Circuit Diagram

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The Battery voltage is between 10 and 16 volts.

SET CONDITION

- The Steering Column Control Module (SCCM) detects no communication with the Speed Control Switch for greater than five seconds.

DEFAULT ACTION

- The Cruise Control Switches will be inactive.

POSSIBLE CAUSES

Possible Causes
RIGHT STEERING WHEEL SWITCH (SPEED CONTROL SWITCH) UNPLUGGED, POOR CONNECTION OR WIRING HARNESS
RIGHT STEERING WHEEL SWITCH (SPEED CONTROL SWITCH)
STEERING COLUMN CONTROL MODULE (SCCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read the Steering Column Control Module (SCCM) DTCs and record on the repair order.

       Is the DTC active?

       Yes

       - Go To 2

       No

       - The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. If no problems are found, test complete.
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE RIGHT STEERING WHEEL SWITCH AND WIRING HARNESS**
    1. Visually and physically inspect the wiring harness between the Right Steering Wheel Switch (Speed Control Switch) harness connector and the SCCM C3 harness connector for damaged wires, connectors, and open/spread terminals.

       Were there any problems found?

       Yes

       - Repair or replace the wiring harness as necessary.
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

       No

       - Go To 3

3. **CHECK THE STEERING COLUMN CONTROL MODULE**
    1. Replace the Right Steering Wheel Switch (Speed Control Switch) in accordance to the Service Information. Refer to **SWITCH, SPEED CONTROL, REMOVAL** .

        Does this DTC reset?

        Yes

        - Replace the Steering Column Control Module (SCCM) in accordance to the Service Information. Refer to **MODULE, STEERING COLUMN CONTROL, REMOVAL** .
        - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

        No

        - Test Complete.
        - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

.

Article GUID: A00735912

2015-16 STEERING

Steering System - Challenger

WARNING

WARNING

WARNING: **Power steering fluid, engine parts and exhaust system may be extremely hot if engine has been running. Do not start engine with any loose or disconnected hoses. Do not allow hoses to touch hot exhaust manifold or catalyst.**

WARNING: **Fluid level should be checked with the engine off to prevent personal injury from moving parts.**

CAUTION

CAUTION

CAUTION: **When the power steering system is open, cap all open ends of the hoses, power steering pump fittings or power steering gear ports to prevent entry of foreign material into the components.**

CAUTION: **When servicing power steering components, do not pinch off power steering hoses in any way to stop fluid flow. Damage to hoses may result.**

NOTE: **The Electronic Stability Control (ESC) may also be referred to as Electronic Stability Program (ESP) depending on the vehicle model year and configuration. Certain components may also reference ESP, ESC, or use the traction control symbol.**

CAUTION: **If the steering wheel is excessively off-center while driving, outside of Chassis specifications, inadvertent ESC activations may occur on a vehicle so equipped.**

DESCRIPTION

DESCRIPTION

ELECTRIC POWER STEERING

Vehicles with Electric Power Steering (EPS) system consisting of:

- Steering column
- Rack and pinion steering gear
- EPS module
- Inner and Outer tie rod ends

- Intermediate shaft

HYDRAULIC POWER STEERING

Vehicles with Hydraulic Power Steering system consisting of:

- Steering column
- Rack and pinion steering gear
- Belt driven hydraulic steering pump with integrated reservoir
- Pump pressure, return and supply hoses
- Oil Cooler
- Inner and Outer tie rod ends

DIAGNOSIS AND TESTING

POWER STEERING FLOW AND PRESSURE TEST - HYDRAULIC

The following procedure is used to test the operation of the power steering system on this vehicle. This test will provide the gallons per minute (GPM) or flow rate of the power steering pump along with the maximum relief pressure. Perform this test anytime a power steering system problem is present. This test will determine if the power steering pump or power steering gear is not functioning properly. The following test is performed using the Power Steering Analyzer Kit (special tool #6815, Kit, Power Steering) (with appropriate hoses) and Adapters from Power Steering Analyzer Adapter Kit (special tool #6893A, Kit, Power Steering). Refer to SPECIAL TOOLS.

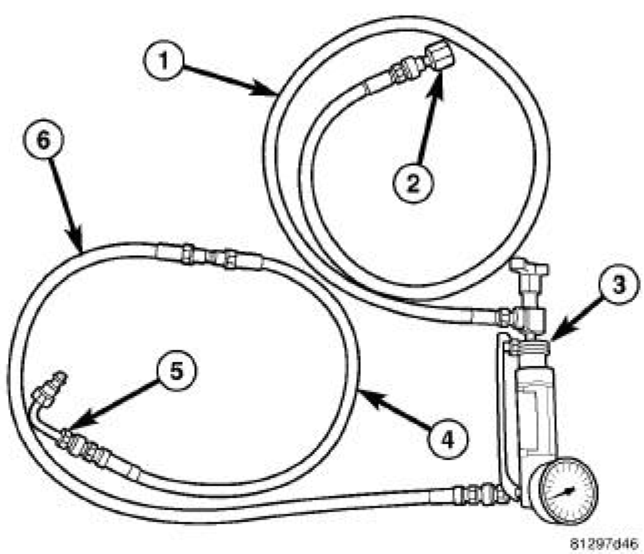

Fig. 1: Power Steering Analyzer Components
Courtesy of CHRYSLER GROUP, LLC

1. Check power steering belt to ensure it is in good condition and adjusted properly.
2. Assemble Power Steering Analyzer as follows:
   a. Gauge end (inlet) of Flow Meter And Gauge (special tool #6800, Analyzer, Power Steering) (3) - Hose (special tool #6905, Assembly, Hose) (6), Hose (special tool #6713, Hose, Power Steering)

(4), Adapter Tube (special tool #6844, Adapter, Power Steering (Truck)) (5)

b. Valve end (outlet) of Flow Meter And Gauge (special tool #6800, Analyzer, Power Steering) (3) - Hose (special tool #6959, Assembly, Hose) (1), Adapter Fitting (special tool #6826, Adapter, LH P/S Tester) (2)

3. Unthread pressure hose tube nut at power steering pump.
4. Connect Adapter Tube (special tool #6844, Adapter, Power Steering (Truck)) to pressure fitting on power steering pump. Tighten tube nut to specifications. Refer to **SPECIFICATIONS**.
5. Connect power steering pressure hose to Adapter Fitting (special tool #6826, Adapter, LH P/S Tester). Tighten tube nut to specifications. Refer to **SPECIFICATIONS**.
6. Open Analyzer test valve completely.
7. Start engine and allow to idle long enough to circulate power steering fluid through Analyzer flow meter and hoses.
8. Shut off engine and check fluid level; add fluid as necessary. Repeat Step 7 and Step 8 until the air is bled from the system.
9. Start engine and allow to idle.
10. Check Analyzer gauge (3) pressure. Initial pressure reading should be less than 1379 kPa (300 psi). If pressure is higher, inspect hoses for restrictions and repair as necessary.
11. Increase engine speed to 1, 200 RPM for SRT8 and read Analyzer Flow Meter. The reading should be 8.2 LPM (2.2 GPM) minimum. If flow reading is below specification, replace power steering pump.

CAUTION: The following test procedure involves testing maximum pump pressure output and flow control valve operation. Do not leave valve closed for more than five seconds as the pump could be damaged.

12. Close valve fully three times and record highest pressure indicated each time. **All three readings must be above specifications and within 345 kPa (50 psi) of each other.**
    - Power steering pump pressures above specifications but not within 345 kPa (50 psi) of each other, replace pump.
    - Pressures within 345 kPa (50 psi) of each other but below specifications, replace pump.

CAUTION: Do not force the pump to operate against the stops for more than 2 to 4 seconds at a time because, pump damage will result.

13. Completely open the valve on the Power Steering Analyzer. Turn the steering wheel to the extreme left until the stop in the steering gear is met, then turn the steering wheel to the right until the right stop is met. Record the highest indicated pressure at each position. Compare the recorded readings to the specifications. If the highest recorded output pressure reading against one stop is not within 345 kPa (50 psi) of the highest recorded reading at the other stop, the steering gear is leaking internally and must be replaced.

PUMP SPECIFICATIONS

VEHICLE	RELIEF PRESSURE
SRT Vehicles	11307 to 11997 kPa (1640-1740 psi)

STEERING DIAGNOSIS CHARTS

..

NOTE: **There are three diagnosis charts following that cover NOISE, VIBRATION AND HARSHNESS (NVH) ISSUES, PERFORMANCE ISSUES, and FLUID ISSUES.**

NOISE, VIBRATION AND HARSHNESS (NVH) ISSUES

CONDITION	POSSIBLE CAUSES	EVALUATION/CORRECTION
OBJECTIONABLE HISS OR WHISTLE WHILE TURNING STEERING WHEEL WHEN STATIONARY OR MOVING SLOWLY*	1. Damaged or mispositioned steering column shaft/coupling dash boot seal.	1. Check to ensure boot is properly installed and seals against sheet metal. Reposition or replace steering column shaft/coupling dash boot seal as necessary.
Ā	2. Mis-routed power steering hose.	2. Check routing of power steering hoses. Ensure hoses do not come in unwanted contact with other components and objects.
Ā	3. Restriction in pressure or return hose.	3. Using an electronic listening tool, determine if noise is coming from either pressure or return hose. Replace hose that noise is present within.
Ā	4. Noisy valve in power steering gear.	4. For evaluation and correction. Refer to **GEAR, DIAGNOSIS AND TESTING**.
RATTLE OR EXCESSIVE CLUNK**	1. Power steering gear loose on engine cradle/crossmember.	1. Check fastener torque and tighten to specifications. Replace as necessary. Check steering wheel center following repair.
Ā	2. Loose strut assembly mounting fasteners at tower or knuckle.	2. Check fastener torque and tighten to specifications.
Ā	3. Excessive play in outer tie rod.	3. For evaluation and correction. Refer to **TIE ROD, STEERING, DIAGNOSIS AND TESTING**.
Ā	4. Engine cradle/crossmember mounting fasteners loose at frame or bushings worn.	4. Check fastener torque and tighten to specifications. Inspect bushings and repair as necessary.
Ā	5. Wheel mounting (lug) nuts loose.	5. Inspect wheel mounting (lug) nuts and studs and repair as necessary. Tighten nuts to specifications.
Ā	6. Power steering hose touching the body or frame of vehicle.	6. For evaluation and correction. Refer to **PUMP, DIAGNOSIS AND TESTING**.
Ā	7. Stabilizer bar link joints worn (occurs with steering input only when moving, not stationary).	7. At park, jounce only one side of vehicle front to exercise stabilizer bar. Replace stabilizer bar link.
Ā	8. Loose lower control arm or tension strut mounting bolts at engine cradle, frame or crossmember (occurs with steering input only when	8. Check control arm or tension strut mounting bolts and tighten to specified torque.

CONDITION	POSSIBLE CAUSES	EVALUATION/CORRECTION
	moving, not stationary).	
Ā	9. Loose intermediate shaft or column.	9. Rotate intermediate (steering) shaft in relationship to gear, checking for free-play. Check column fasteners and tighten to specifications as necessary.
Ā	10. Lower control arm pivot bushing worn (occurs with steering input only when moving, not stationary).	10. Inspect bushings for wear and replace lower control arm as necessary.
Ā	11. Internal power steering gear noise.	11. Drive vehicle on rough road, then steer rapidly back and forth when stopped. Replace power steering gear as necessary.
Ā	12. Loose inner tie rod.	12. For evaluation and correction. Refer to **TIE ROD, STEERING, DIAGNOSIS AND TESTING**.
Ā	13. Damaged engine cradle/crossmember.	13. Inspect the cradle/crossmember for cracks or other damage. Replace as necessary.
POPPING NOISE	1. Loose steering gear mounting fasteners.	1. Check fasteners for proper torque and retighten as necessary.
Ā	2. Loose outer tie rod mounting nut or jam nut.	2. Check fastener torque. Replace nuts as necessary and tighten to specifications.
Ā	3. Loose intermediate (steering) shaft coupling at gear input shaft.	3. Make sure coupling is fully seated on gear input shaft. Remove and replace as necessary.
Ā	4. Worn tie rod (outer or inner).	4. For evaluation and correction. Refer to **TIE ROD, STEERING, DIAGNOSIS AND TESTING**.
Ā	5. Worn axle half-shaft.	5. For evaluation and correction. Refer to **DIAGNOSIS AND TESTING** .
CHIRP OR SQUEAL (POWER STEERING PUMP)	1. Loose power steering pump drive belt.	1. Inspect belt. Replace belt if worn or glazed. Tighten/adjust power steering pump drive belt if equipped with a manual tensioner.
Ā	2. Pulley alignment incorrect.	2. Realign accessory drives.
Ā	3. Malfunctioning belt auto-tensioner.	3. Verify belt tension. Replace belt auto-tensioner.
Ā	4. Power steering pump noisy (worn bearing/bushing noise).	4. Using an electronic listening tool, determine if noise is coming from pump. Replace power steering pump as required.
Ā	5. Generator or water pump noisy.	5. Using an electronic listening tool, determine if noise is coming from Generator or water pump. Replace faulty component.

CONDITION	POSSIBLE CAUSES	EVALUATION/CORRECTION
WHINE, GROWL, MOAN OR GROAN (POWER STEERING PUMP)***	1. Low power steering fluid level.	1. Fill power steering fluid reservoir to proper level and check for leaks (make sure all air is bled from the system fluid).
Ā	2. Air in power steering fluid.	2. Inspect for excessive air bubbles in fluid (fluid will appear foamy and lighter in color). Inspect hoses for leaks and replace as necessary. Bleed air from fluid. Refer to **STANDARD PROCEDURE**.
Ā	3. Power steering hose touching body or frame of vehicle.	3. For evaluation and correction. Refer to **PUMP, DIAGNOSIS AND TESTING**.
Ā	4. Wear of power steering pump internal components.	4. For evaluation and correction. Refer to **PUMP, DIAGNOSIS AND TESTING**.
COLD START WHINE OR MOAN (POWER STEERING PUMP)***	1. Low power steering fluid level.	1. Fill power steering fluid reservoir to proper level and check for leaks (make sure all air is bled from the system fluid).
Ā	2. Extremely low ambient temperature (near -18 CĀ° (0 FĀ°) or below).	2. Some noise is expected as pump attempts to pull cold, thick fluid. Noise should go away as vehicle warms up. Acceptable levels of excessive noise are one second at -18 CĀ° (0 FĀ°) and 15 seconds at -29 CĀ° (-20 FĀ°). If noise is excessive, look for poor sealing on the return hose or a possible fluid leak.
SQUEAKING OR RUBBING SOUND	1. Steering column shroud or shaft rubbing.	1. While turning the steering wheel, listen down column to locate. Check interference between moving components. Move or realign shrouds or shaft as necessary. Replace components if this does not correct problem.
Ā	2. Clockspring inside steering column noisy.	2. Remove clockspring and reinstall steering wheel for testing. If noise is gone, replace clockspring.
Ā	3. Boot/dash seal lubrication inadequate.	3. Remove boot seal and recheck for noise. Lubricate seal as necessary.
Ā	4. Steering gear outer tie rod noisy.	4. While a helper turns the steering wheel, use an electronic listening tool to determine if noise is coming from either outer tie rod. Replace outer tie rods as necessary.
Ā	5. Steering gear internally noisy.	5. Remove dash seal boot, then exercise the steering wheel. If noise is still present at gear, replace steering gear.
SCRUBBING OR KNOCKING SOUND	1. Incorrect tire or wheel size.	1. Replace incorrect size tire or wheel with original equipment size.

CONDITION	POSSIBLE CAUSES	EVALUATION/CORRECTION
Ā	2. Worn motor or transmission mount.	2. Drive vehicle, moving accelerator pedal rapidly up and down attempting to locate noise. Try in both forward and reverse. Replace mounts as necessary.
Ā	3. Tires contacting wheel well.	3. Make sure wheel house is properly positioned. If not, reposition as necessary. If steering wheel is properly centered, check steering gear travel left to right by rotating the steering wheel to each stop. Steering wheel should rotate the same amount in both directions from center. If not, replace steering gear.
Ā	4. Interference between moving steering components and other components.	4. Check for bent or misaligned components. Correct or replace as necessary.
Ā	5. Accessory drive pulley rubbing against another component.	5. Check pulleys for wear. Check for worn engine or transmission mount. Reposition components or replace mounts as necessary.

NOTE: *** There is some noise in all power steering systems. One of the most common is a hissing sound evident when turning the steering wheel when at a standstill or when parking and the steering wheel is at the end of its travel. Hiss is a very high frequency noise similar to that experienced while slowly closing a water tap. The noise is present in every valve and results when high velocity fluid passes valve orifice edges. There is no relationship between this noise and the performance of the steering system.**

NOTE: **** A light clunk may be felt or heard during steering wheel reversal while vehicle is stationary. This results from internal steering gear rack movement at the bushings and in no way affects the performance of the steering system. This movement may be felt in the steering components during steering wheel reversal.**

NOTE: ***** Power steering pump growl/moan/groan results from the development of high pressure fluid flow. Normally this noise level should not be high enough to be objectionable.**

PERFORMANCE ISSUES

CONDITION	POSSIBLE CAUSES	EVALUATION/CORRECTION
STEERING WHEEL OR COLUMN HAS FREE-PLAY/LASH /LOOSENESS (CLUNKING OR RATTLING)	1. Loose coupling pinch bolt at gear input shaft.	1. Check pinch bolt torque. Replace pinch bolt if equipped with thread locker patch and tighten to specifications.

CONDITION	POSSIBLE CAUSES	EVALUATION/CORRECTION
Ā	2. Power steering gear loose on cradle/crossmember.	2. Inspect gear mounting bolts. Replace if necessary and tighten to specifications.
Ā	3. Excessive free-play or noise from steering column bearings.	3. Replace steering column.
Ā	4. Excessive intermediate (steering) shaft coupling U-joint free-play.	4. Rotate steering wheel back-and-forth while watching coupling. Observe for free-play. Replace intermediate shaft as necessary.
Ā	5. Loose or worn outer tie rod.	5. For evaluation and correction. Refer to **TIE ROD, STEERING, DIAGNOSIS AND TESTING**.
Ā	6. Lack of lubrication in lower ball joint or ball joint is damaged.	6. For evaluation. Refer to **BALL JOINT, SUSPENSION, LOWER, DIAGNOSIS AND TESTING** . Lubricate ball joint if equipped with a zerk fitting and check for function. If not equipped with a zerk fitting, test and replace ball joint as necessary.
Ā	7. Excessive lash inside steering gear.	7. Disconnect intermediate shaft and turn steering gear input shaft. Observe for any movement without a corresponding tire movement. Replace steering gear as necessary.
STEERING WHEEL HAS FORE AND AFT LOOSENESS	1. Steering wheel retaining bolt loose.	1. Check steering wheel retaining bolt torque and tighten to specifications as necessary.
Ā	2. Loose steering column to instrument panel fasteners.	2. Check steering column to instrument panel fastener torque and tighten to specifications as necessary.
STEERING WHEEL, DASH OR VEHICLE VIBRATES DURING STEERING MANEUVERS (ESPECIALLY AT LOW SPEED OR STANDSTILL)	1. Air in power steering fluid.	1. Inspect for excessive air bubbles in fluid (fluid will appear foamy and lighter in color). Inspect hoses for leaks and replace as necessary. Bleed air from fluid. Refer to **STANDARD PROCEDURE**.
Ā	2. Tire(s) not properly inflated.	2. Check and inflate tires to the specified pressure.
Ā	3. Excessive engine vibration.	3. Ensure that the engine is tuned properly.
Ā	4. Loose tie rod end jam nut.	4. Check torque and tighten the inner to outer tie rod jam nut to specifications.
Ā	5. Overcharged air conditioning (A/C) system.	5. Turn A/C off and verify issue goes away. Repair A/C as necessary.
Ā	6. Grounded, damaged or loose engine mount.	6. Visually inspect for damaged or misaligned mounts. Check fastener torque. Replace,

CONDITION	POSSIBLE CAUSES	EVALUATION/CORRECTION
		realign or retighten as necessary.
Ā	7. Loose or worn outer tie rod.	7. For evaluation and correction. Refer to **TIE ROD, STEERING, DIAGNOSIS AND TESTING**.
Ā	8. Steering gear noisy.	8. During a parking event at 0 mph, verify there is vibration only with steering. Steer in both directions and verify that the noise follows the steering input. Check TSB's for any known issue. Replace steering gear as necessary.
STEERING CATCHES, SURGES OR STICKS IN CERTAIN POSITIONS OR IS DIFFICULT TO TURN	1. Low power steering fluid level.	1. Check fluid level and fill to proper level as necessary. Check for leaks. Make sure all air is bled from system.
Ā	2. Tire(s) not properly inflated.	2. Check and inflate tires to the specified pressure.
Ā	3. Loose or slipping power steering/accessory drive belt.	3. Verify belt tension. Replace belt auto-tensioner and belt as necessary.
Ā	4. Lack of lubrication in lower ball joint or ball joint is damaged.	4. For evaluation. Refer to **BALL JOINT, SUSPENSION, LOWER, DIAGNOSIS AND TESTING** . Lubricate ball joint if equipped with a zerk fitting and check for function. If not equipped with a zerk fitting, test and replace ball joint as necessary.
Ā	5. Lack of lubrication in steering gear outer tie rod end(s).	5. For evaluation and correction. Refer to **TIE ROD, STEERING, DIAGNOSIS AND TESTING**.
Ā	6. Faulty power steering pump.	6. Perform Power Steering Flow and Pressure Test. Refer to **DIAGNOSIS AND TESTING**. Look for low or erratic flow or pressure. Replace power steering pump as necessary.
Ā	7. Excessive friction in intermediate shaft/coupler joint.	7. Disconnect intermediate shaft/coupler at steering gear and check joint for smooth operation in all directions. Replace intermediate shaft/coupler joint.
Ā	8. Excessive friction in steering column.	8. Disconnect intermediate shaft/coupler at steering gear. Turn steering wheel two revolutions in either direction from on center and check for smooth operation. DO NOT turn past two revolutions. Damage to the clockspring may occur. Replace steering column as necessary.

CONDITION	POSSIBLE CAUSES	EVALUATION/CORRECTION
Ā	9. Worn or binding seat and bearing in front strut assembly.	9. Disconnect outer tie rod ends from knuckles, then turn tire and wheel assembly checking for smooth operation. Replace front strut assembly seat and bearing.
Ā	10. Faulty steering gear.	10. With vehicle on hoist, tires unsupported and engine off, steer gear throughout travel and check for smooth operation. Replace steering gear (only after all previous components have been checked).
STEERING WHEEL DOES NOT RETURN TO CENTER POSITION	1. Tire(s) not properly inflated.	1. Check and inflate tires to the specified pressure.
Ā	2. Improper front wheel alignment.	2. Check and adjust wheel alignment as necessary.
Ā	3. Lack of lubrication in lower ball joint or ball joint is damaged.	3. For evaluation. Refer to **BALL JOINT, SUSPENSION, LOWER, DIAGNOSIS AND TESTING** . Lubricate ball joint if equipped with a zerk fitting and check for function. If not equipped with a zerk fitting, test and replace ball joint as necessary.
Ā	4. Excessive friction in intermediate shaft/coupler joint.	4. Disconnect intermediate shaft/coupler at steering gear and check joint for smooth operation in all directions. Replace intermediate shaft/coupler joint.
Ā	5. Excessive friction in steering column.	5. Disconnect intermediate shaft/coupler at steering gear. Turn steering wheel two revolutions in either direction from on center and check for smooth operation. DO NOT turn past two revolutions. Damage to the clockspring may occur. Replace steering column as necessary.
Ā	6. Worn or binding seat and bearing in front strut assembly.	6. Disconnect steering gear outer tie rod ends at knuckles, then turn tire and wheel assembly in and out checking for smooth operation. Replace seat and bearing as necessary.
Ā	7. Excessive friction in power steering gear.	7. With vehicle on hoist, tires unsupported and engine off, steer gear throughout travel and check for smooth operation. Replace steering gear (only after all previous components have been checked).
EXCESSIVE STEERING WHEEL KICKBACK FROM ROAD INPUTS	1. Air in power steering fluid.	1. Inspect for excessive air bubbles in fluid (fluid will appear foamy and lighter in color). Inspect hoses for leaks and replace as necessary. Bleed air from fluid. Refer to

CONDITION	POSSIBLE CAUSES	EVALUATION/CORRECTION
		STANDARD PROCEDURE.
Ā	2. Power steering gear loose on cradle/crossmember.	2. Inspect gear mounting bolts. Replace if necessary and tighten to specifications.
Ā	3. Steering column, coupling or intermediate shaft worn or loose.	3. Rotate steering wheel back-and-forth while inspecting intermediate shaft going into steering gear. Look for excessive free-play. Replace bolt if it is found loose. Replace steering column, coupling or intermediate shaft if necessary.
Ā	4. Power steering pump flow is too low.	4. Perform Power Steering Flow and Pressure Test. Refer to **DIAGNOSIS AND TESTING**. Look for low or erratic flow or pressure. Replace power steering pump as necessary.

FLUID ISSUES

CONDITION	POSSIBLE CAUSES	EVALUATION/CORRECTION
LOW FLUID LEVEL WITH VISIBLE LEAK	1. Loose power steering hose fittings or connections.	1. Check torque on all tube nuts (at gear and pump). Inspect clamps at all rubber hose connections for correct position, damage and tension. Tighten tube nuts as required. Reposition or replace clamps at hose connections. Clean joints and reinspect for leaks.
Ā	2. Damaged or missing O-ring at power steering hose tube nuts.	2. Remove tube nut and inspect O-ring. If damaged or missing, replace O-ring. Clean joints and reinspect for leaks.
Ā	3. Power steering line or hose failure.	3. Clean fluid from around suspect areas. Run vehicle and inspect for leaks. Look inside reservoir to see if air is being ingested. Replace hoses as necessary.
Ā	4. Power steering component leaking (reservoir, pump, gear).	4. Clean fluid from around suspect areas. Run vehicle and inspect for leaks. Look inside reservoir to see if air is being ingested. Replace power steering component as necessary.
AERATED FLUID*	1. Low power steering fluid level.	1. Check fluid level and fill to proper level as necessary. Check for leaks. Make sure all air is bled from system.
Ā	2. Air leak at power steering supply hose, reservoir or pump.	2. Inspect components. Place a hand vacuum pump with Adapter 9688 on reservoir and verify that system can sustain vacuum. System should not lose more than 1 psi (7 kPa) in 2 minutes (make sure vacuum pump is sealed well to the reservoir). Replace steering component as necessary.

CONDITION	POSSIBLE CAUSES	EVALUATION/CORRECTION
RESERVOIR FLUID OVERFLOW OR FLUID THAT IS MILKY IN COLOR	1. Water contamination of power steering fluid.	1. Inspect fluid for milky appearance. Completely drain power steering fluid. Refill and bleed system. Refer to **STANDARD PROCEDURE**.

NOTE: *** Extremely cold temperatures may cause power steering fluid aeration. The air should work its way out of the system as the fluid warms.**

STANDARD PROCEDURE

STANDARD PROCEDURE - POWER STEERING SYSTEM BLEEDING

19-0000-00000-36-TITLE

WARNING: **The fluid level should be checked with engine off to prevent injury from moving components.**

CAUTION: **If the air is not purged from the power steering system correctly, pump failure could result.**

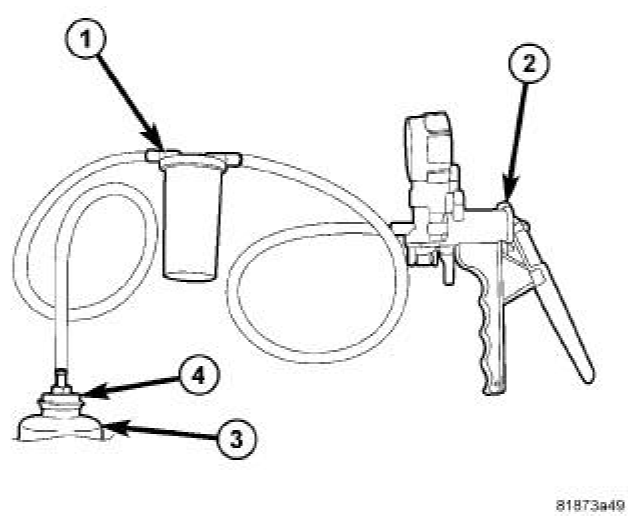

Fig. 2: Hand Vacuum Pump On Reservoir
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Be sure the vacuum tool used in the following procedure is clean and free of any fluids.**

1. Check the fluid level. As measured on the side of the reservoir, the level should indicate between ADD and FULL COLD when the fluid is at normal ambient temperature. Adjust the fluid level as necessary. Refer to **FLUID, STANDARD PROCEDURE**.
2. Tightly insert Power Steering Cap Adapter (4), Special Tool (special tool #9688A, Cap Adapter, Power Steering Pump), into the mouth of the reservoir.

CAUTION: Failure to use a the vacuum pump reservoir (1) may allow power steering fluid to be sucked into the hand vacuum pump.

3. Attach Hand Vacuum Pump (2), Special Tool (special tool #C-4207-A, Vacuum Pump, Hand) or equivalent, with reservoir (1) attached, to the Power Steering Cap Adapter (4).

CAUTION: Do not run the engine while vacuum is applied to the power steering system. Damage to the power steering pump can occur.

NOTE: When performing the following step make sure the vacuum level is maintained during the entire time period.

4. Using Hand Vacuum Pump (2), apply 68-85 kPa (20-25 in. Hg) of vacuum to the system for a minimum of three minutes.
5. Slowly release the vacuum and remove the special tools.
6. Adjust the fluid level as necessary.
7. Start the engine and cycle the steering wheel lock-to-lock three times.

NOTE: Do not hold the steering wheel at the stops.

8. Stop the engine and check for leaks at all connections.
9. Check for any signs of air in the reservoir and check the fluid level. If air is present, repeat the procedure as necessary.

COLUMN

DESCRIPTION

DESCRIPTION

WARNING: The airbag system is a sensitive, complex electro-mechanical unit. Before attempting to diagnose, remove or install the airbag system components you must first disconnect and isolate the battery negative (ground) cable. Then wait two minutes for the system capacitor to discharge. Failure to do so could result in accidental deployment of the airbag and possible personal injury. The fasteners, screws, and bolts, originally used for the airbag components, have special coatings and are specifically designed for the airbag system. They must never be replaced with any substitutes. Anytime a new fastener is needed, replace with the correct fasteners provided in the service package or fasteners listed in the parts books.

CAUTION: Do not hammer on steering column shaft. This may cause damage to the column internally.

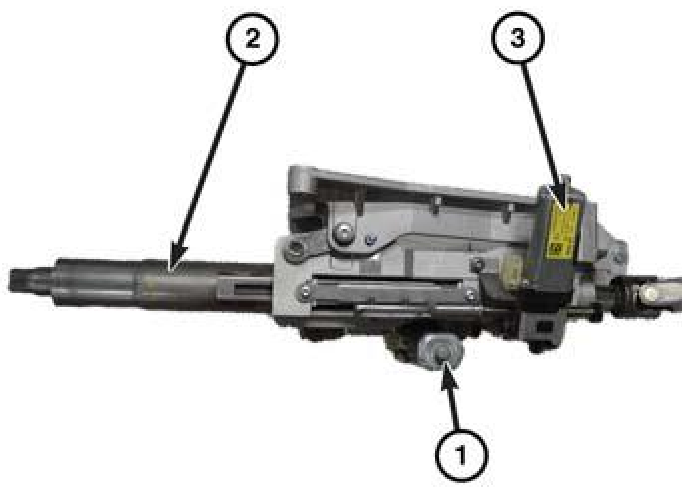

Fig. 3: Tilt Motor, Electronic Tilt/Telescope & Telescoping Motor
Courtesy of CHRYSLER GROUP, LLC

There are two types of columns available: electronic tilt/telescope (2) and manual tilt/telescope (not shown in illustration). Each type of column has been designed to be serviced as an assembly less wiring, switches, steering wheel, etc.

There are no serviceable components on the steering column.

The electronic tilt and telescope column is operated by a switch on the column located below the multi-function switch. If the tilt or telescope function is not working, check the connectors before replacing the column.

When servicing any component of the steering column, refer to WARNING and observe all WARNINGS and CAUTIONS.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - STEERING COLUMN

If the vehicle is involved in a front end collision or the air bag has deployed or both, the steering column must be replaced.

REMOVAL

REMOVAL

WARNING: Before servicing the steering column the airbag system must be disarmed. Failure to do so may result in accidental deployment of the airbag and possible personal injury.

CAUTION: Steering column module is centered to the vehicles steering system. Failure to keep the system and steering column module centered and locked/inhibited from rotating can result in steering column module damage.

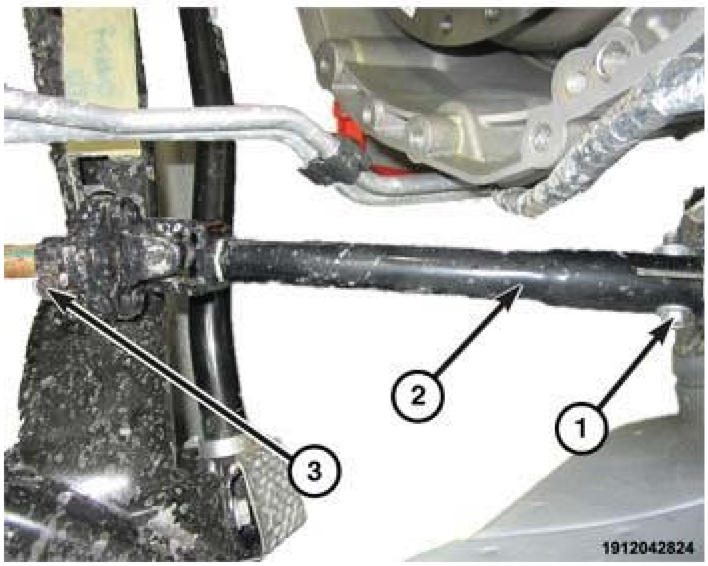

Fig. 4: Lower Intermediate Shaft To Upper Intermediate Shaft Bolt, Lower Intermediate Shaft & Lower Intermediate Shaft To Steering Gear Coupling Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Position front wheels straight ahead.
2. Fully extend the telescoping column.
3. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
4. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
5. Remove and discard the lower intermediate shaft to upper intermediate shaft bolt (1).
6. Separate the lower intermediate shaft (2) from the upper intermediate shaft.
7. Remove the support and lower the vehicle.
8. Remove the steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, REMOVAL** .

9. Remove the steering column control module. Refer to **MODULE, STEERING COLUMN CONTROL, REMOVAL** .

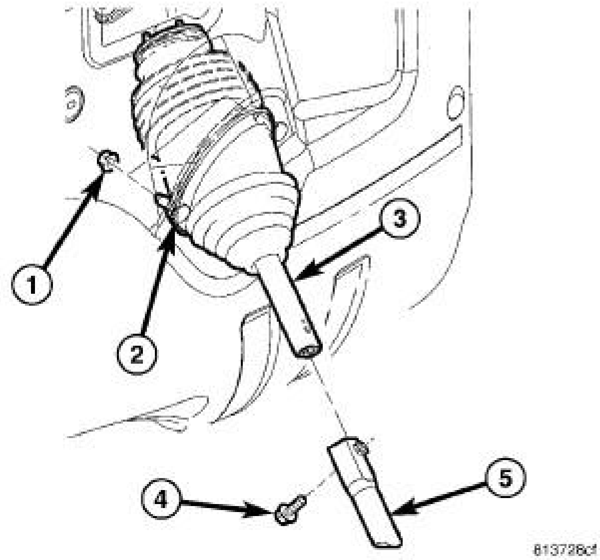

Fig. 5: Shaft Retaining Nuts
Courtesy of CHRYSLER GROUP, LLC

10. Remove two intermediate shaft boot retaining nuts (1) at the bulkhead (2).

Fig. 6: Power Tilt Electrical Connector & Telescope Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

11. If equipped, disconnect the power tilt electrical connector and the telescope electrical connector (1).

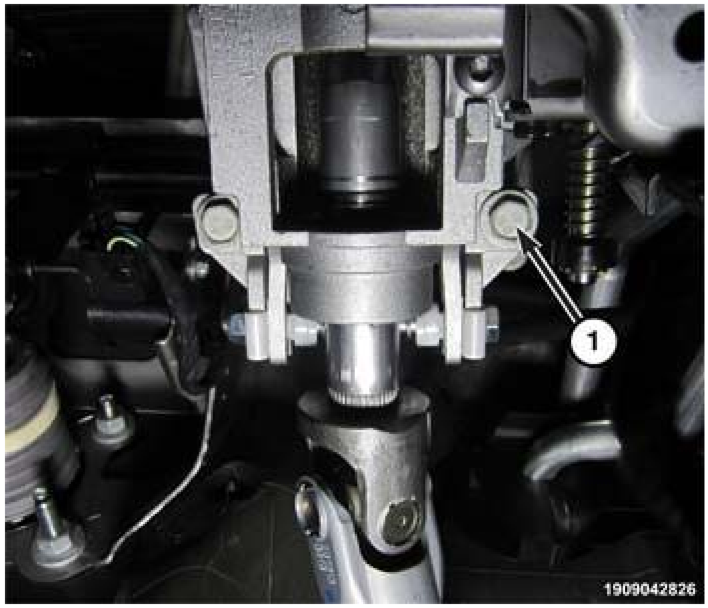

Fig. 7: Column Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

12. Remove front two column mounting bolts (1).

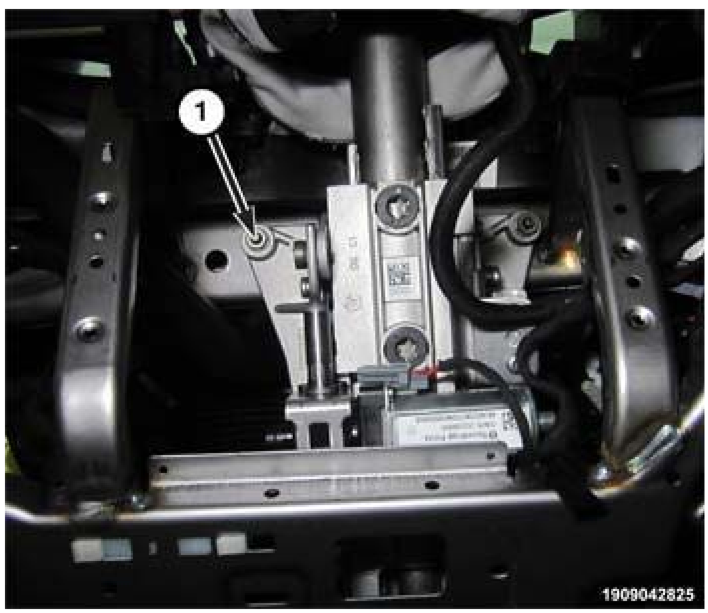

Fig. 8: Mounting Nut
Courtesy of CHRYSLER GROUP, LLC

13. Support the column and remove the two mounting nuts (1).
14. Remove column from the vehicle.

INSTALLATION

INSTALLATION

WARNING: Before servicing the steering column the airbag system must be disarmed. Failure to do so may result in accidental deployment of the airbag and possible

personal injury.

CAUTION: Steering column module is centered to the vehicles steering system. Failure to keep the system and steering column module centered and locked/inhibited from rotating can result in steering column module damage.

NOTE: Make sure the front wheels are still in the straight ahead position.

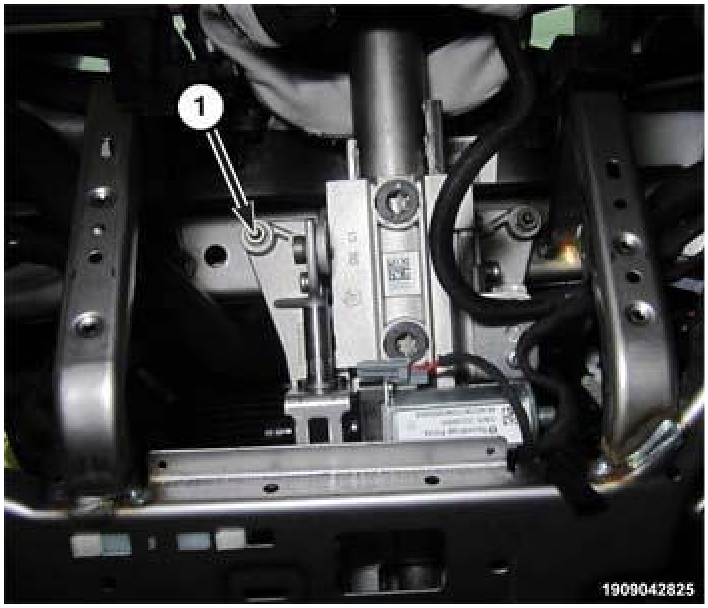

Fig. 9: Mounting Nut
Courtesy of CHRYSLER GROUP, LLC

1. Install the column into the vehicle and lift the column up into place. Loosely install the mounting nuts (1), do not tighten at this time.

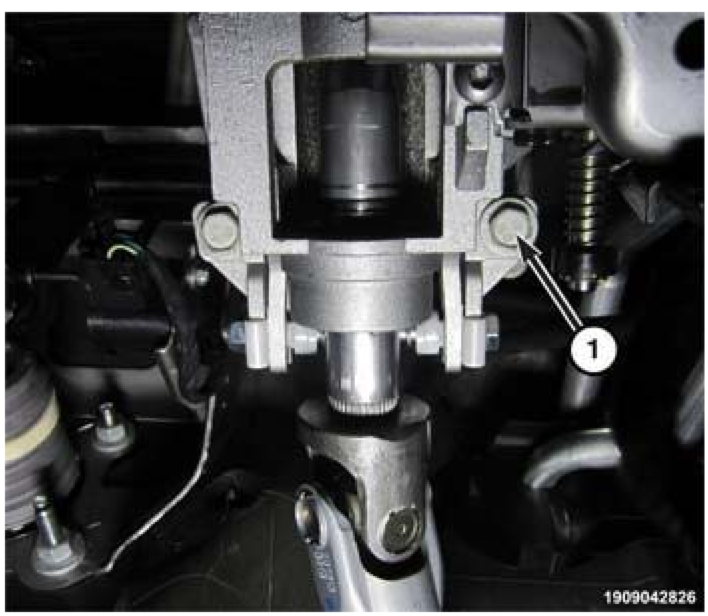

Fig. 10: Column Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

2. Install the two mounting bolts (1) and tighten all four mounting fasteners to the proper specification. Refer to **SPECIFICATIONS**.

Fig. 11: Power Tilt Electrical Connector & Telescope Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

3. If equipped, connect the tilt motor electrical connector and the telescope motor electrical connector (1).
4. Center the intermediate shaft boot at the bulkhead and install the intermediate shaft boot nuts. Tighten the two intermediate shaft boot nuts to the proper specification. Refer to **SPECIFICATIONS**.
5. Install the steering column control module. Refer to **MODULE, STEERING COLUMN CONTROL, INSTALLATION** .
6. Install the steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .
7. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

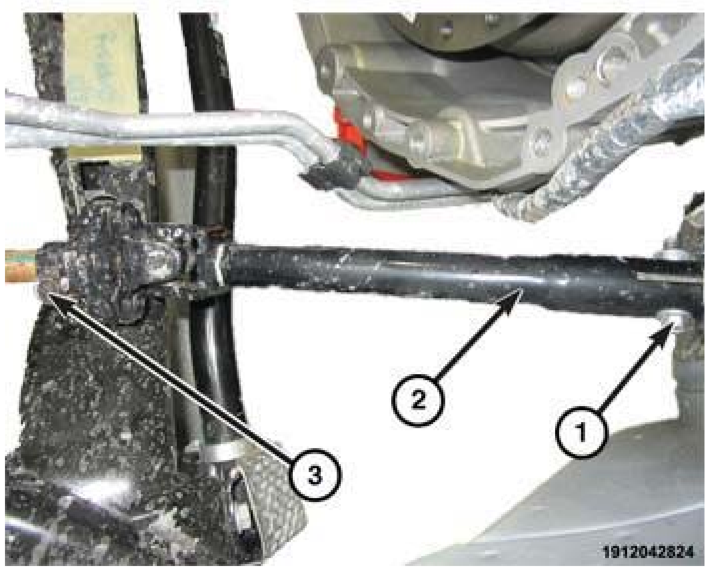

Fig. 12: Lower Intermediate Shaft To Upper Intermediate Shaft Bolt, Lower Intermediate Shaft &

Lower Intermediate Shaft To Steering Gear Coupling Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: **A new lower intermediate shaft to upper intermediate shaft bolt (1) must be installed every time the bolt is removed.**

8. Slide the lower intermediate shaft (2) onto the upper intermediate shaft. Install a **NEW** lower intermediate shaft to upper intermediate shaft bolt (1) and tighten to the proper specification. Refer to **SPECIFICATIONS**.
9. Remove the support and lower the vehicle.
10. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.

SHAFT, INTERMEDIATE, LOWER

REMOVAL

REMOVAL

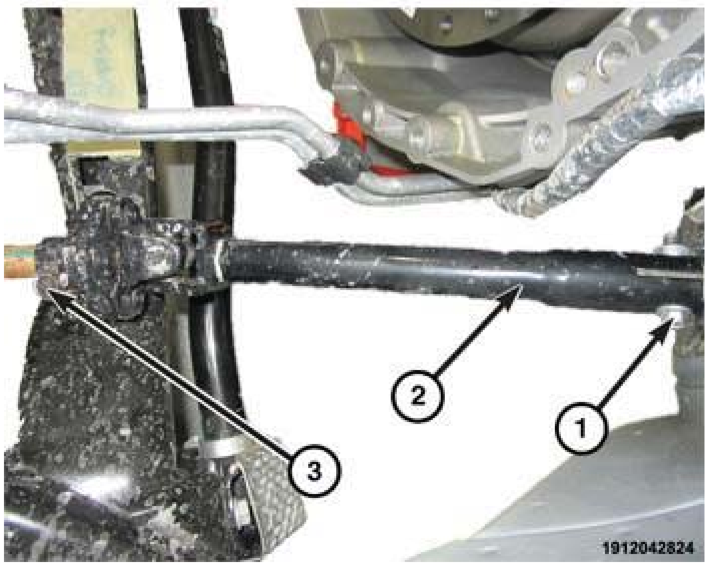

Fig. 13: Lower Intermediate Shaft To Upper Intermediate Shaft Bolt, Lower Intermediate Shaft & Lower Intermediate Shaft To Steering Gear Coupling Bolt
Courtesy of CHRYSLER GROUP, LLC

CAUTION: **Steering column module is centered to the vehicles steering system. Failure to keep the system and steering column module centered and locked/inhibited from rotating can result in steering column module damage.**

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove and discard the lower intermediate shaft to upper intermediate shaft bolt (1).
3. Separate the lower intermediate shaft (2) from the upper intermediate shaft.
4. Remove and discard the lower intermediate shaft to steering gear coupling bolt (3).
5. Carefully separate the intermediate shaft (2) from the steering gear.

INSTALLATION

INSTALLATION

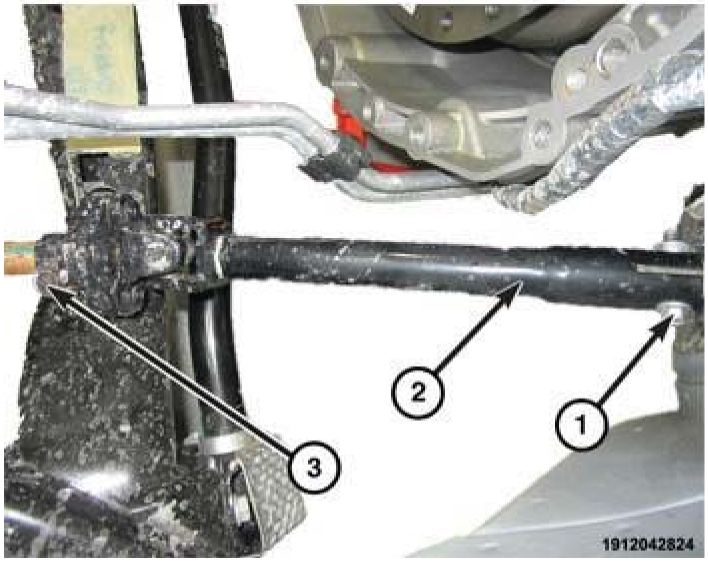

Fig. 14: Lower Intermediate Shaft To Upper Intermediate Shaft Bolt, Lower Intermediate Shaft & Lower Intermediate Shaft To Steering Gear Coupling Bolt
Courtesy of CHRYSLER GROUP, LLC

CAUTION: **Steering column module is centered to the vehicles steering system. Failure to keep the system and steering column module centered and locked/inhibited from rotating can result in steering column module damage.**

NOTE: **A new lower intermediate shaft to upper intermediate shaft bolt (1) must be installed every time the bolt is removed.**

1. Slide the lower intermediate shaft (2) onto the upper intermediate shaft. Install a **NEW** lower intermediate shaft to upper intermediate shaft bolt (1) and tighten to the proper specification. Refer to **SPECIFICATIONS**.

   NOTE: **A new lower intermediate shaft to steering gear coupling bolt (3) must be installed every time the bolt is removed.**

2. Slide the coupler from the lower intermediate shaft (2) onto the steering gear shaft and install a **NEW** lower intermediate shaft to steering gear coupling bolt (3) and tighten to the proper specification. Refer to **SPECIFICATIONS**.
3. Remove the support and lower the vehicle.

SHROUD, STEERING COLUMN

DESCRIPTION

DESCRIPTION

The steering column shroud is serviced with the steering column control module. Refer to **MODULE,**

STEERING COLUMN CONTROL, REMOVAL .

WHEEL, STEERING

REMOVAL

REMOVAL

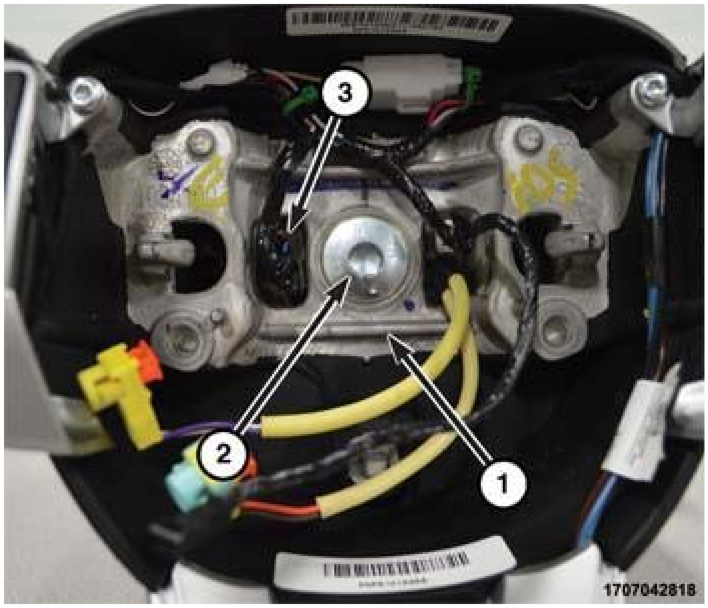

Fig. 15: Steering Wheel, Steering Wheel Bolt & Wire Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

WARNING: Before servicing the steering column, the airbag system must be disarmed. Refer to electrical restraint system for service procedures. Failure to do so may result in accidental deployment of the airbag and possible personal injury.

1. Position the front wheels **straight-ahead** .
2. Fully extend the adjustable steering column.
3. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
4. Remove the driver airbag. Refer to AIR BAG, DRIVER, REMOVAL .
5. Disconnect all wire harness connectors (3).
6. Remove and discard the steering wheel bolt (2) and then slide the steering wheel (1) off the shaft.
7. If the wheel is being replaced, transfer attached components as necessary.

INSTALLATION

INSTALLATION

..

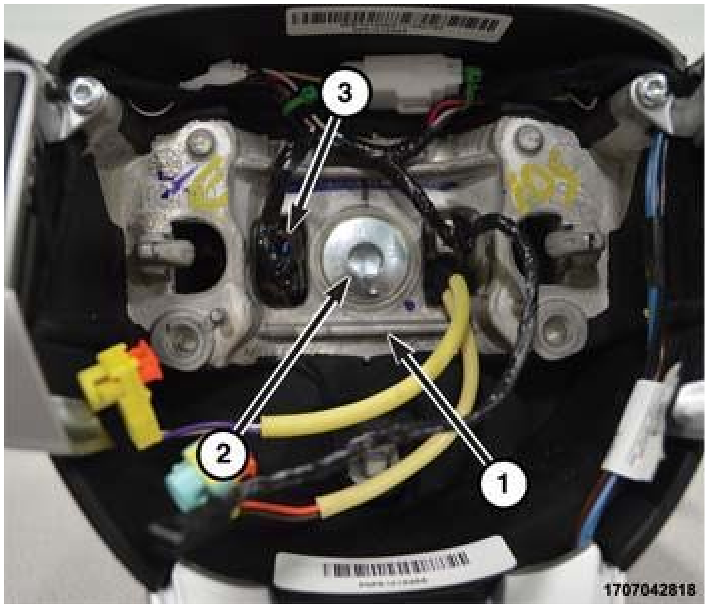

Fig. 16: Steering Wheel, Steering Wheel Bolt & Wire Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

CAUTION: **If the steering wheel is excessively off-center while driving, outside of Chassis specifications, inadvertent ESC activations may occur on a vehicle so equipped.**

1. Align the spline on the steering wheel hub to the column shaft, then install the steering wheel (1).

   NOTE: **A new steering wheel bolt (2) must be installed every time the bolt is removed.**

2. Install a **NEW** steering wheel bolt (2) and tighten to the proper specification. Refer to SPECIFICATIONS.
3. Connect all wire harness connectors (3).
4. Install the driver airbag. Refer to AIR BAG, DRIVER, INSTALLATION .
5. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.
6. Test the operation of the horn, lights and any other functions that are steering column operated.

GEAR

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER STEERING GEAR

NOTE: **This information is designed to be used in conjunction with the diagnostic charts at the beginning of the Steering Service Information. Refer to DIAGNOSIS AND TESTING.**

OBJECTIONABLE HISS OR WHISTLE POSSIBLY CAUSED BY A NOISY STEERING GEAR

1. Check and adjust power steering fluid level in the reservoir as necessary. Refer to **FLUID, STANDARD PROCEDURE**.
2. Start the vehicle and heat system by steering lock-to-lock 5 times with the engine running at 3000 rpm. Do not hold the gear against the stops for more than 15 seconds at a time.
3. Return the engine to idle speed.
4. Listen for the noise when turning the wheel slowly off center during a dry park maneuver.
5. Replace power steering gear if the hiss or whistle is present. Refer to **GEAR, REMOVAL**.

REMOVAL

ELECTRIC POWER STEERING

1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
2. Using a steering wheel holder, lock the steering wheel in place. This will keep the clock spring in the proper orientation.
3. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

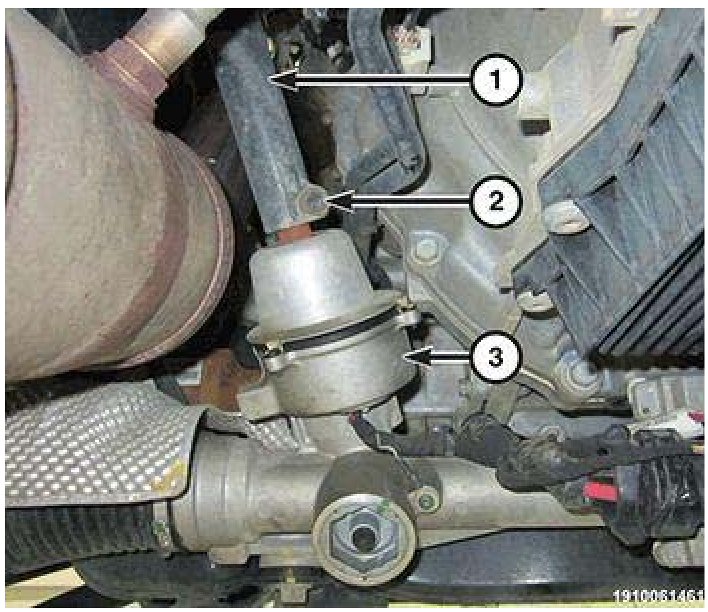

Fig. 17: Lower Intermediate Shaft, Lower Intermediate Shaft Pinch Bolt & Steering Gear
Courtesy of CHRYSLER GROUP, LLC

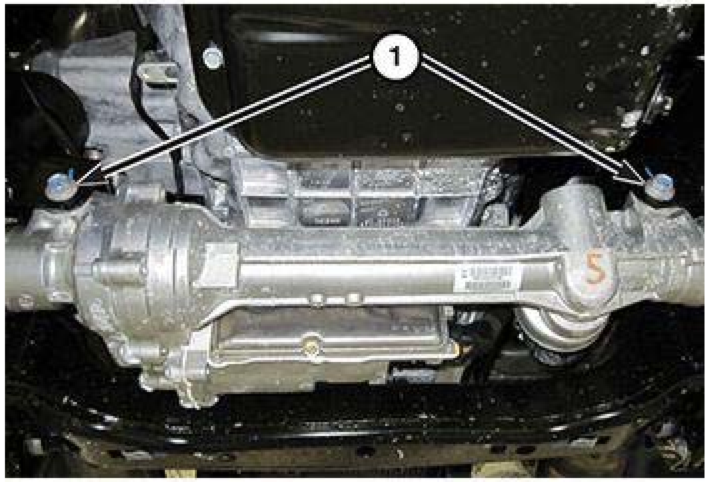
4. Remove the lower intermediate shaft pinch bolt (2) at the steering gear (3). Separate the lower intermediate shaft (1) from the steering gear (3).

[Fig. 18: Outer Tie Rod Nut]
Courtesy of CHRYSLER GROUP, LLC

5. Remove outer tie rod nut (1) at each knuckle.
6. Using Remover (special tool #9360, Remover, Ball Joint), separate the outer tie rod from each knuckle.

[Fig. 19: Steering Gear Wire Harness Connectors]
Courtesy of CHRYSLER GROUP, LLC

7. Remove the two black steering gear wire harness connectors (1) from the steering gear.



1910048556

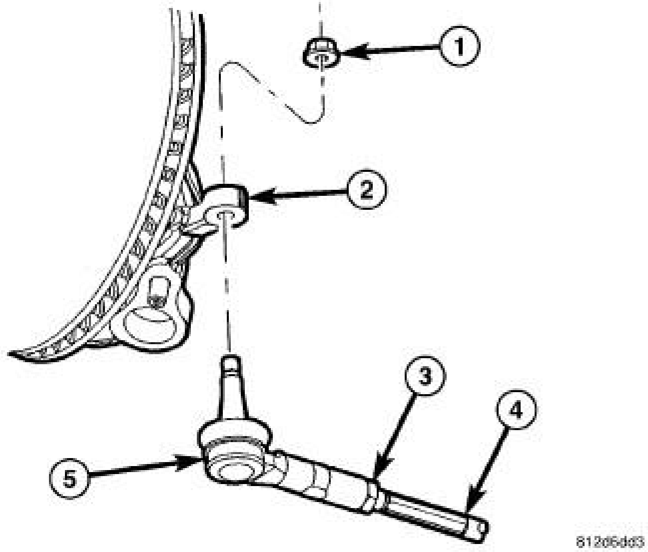
Fig. 20: Steering Gear Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

8. Remove steering gear mounting bolts (1).
9. Remove the steering gear from the vehicle.
10. If necessary, remove the outer tie rods from the gear. Count the number of revolutions during removal for each tie rod, for reference upon installation of a new gear.

HYDRAULIC POWER STEERING

NOTE: **Full hydraulic power steering shown in illustration, electric hydraulic power steering similar.**

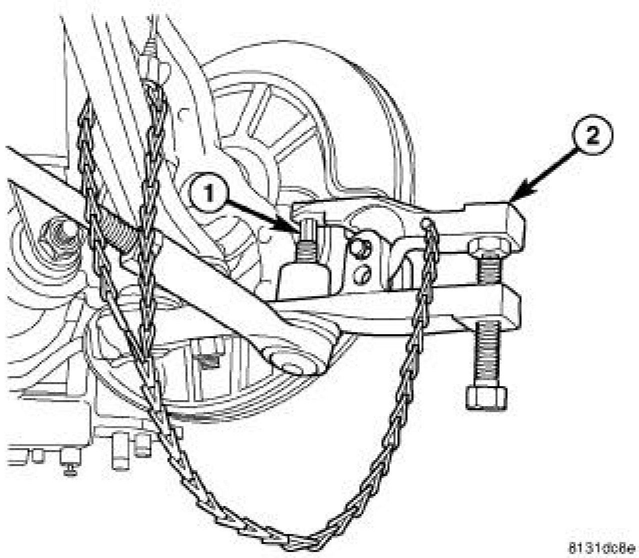
1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
2. Siphon power steering fluid from pump reservoir.
3. Using a steering wheel holder, lock the steering wheel in place to keep it from rotating. This will keep the clock spring in the proper orientation.
4. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
5. Remove the tire and wheel assembly. Refer to **REMOVAL** .



[Fig. 21: Front Outer Tie Rod](#)
Courtesy of CHRYSLER GROUP, LLC

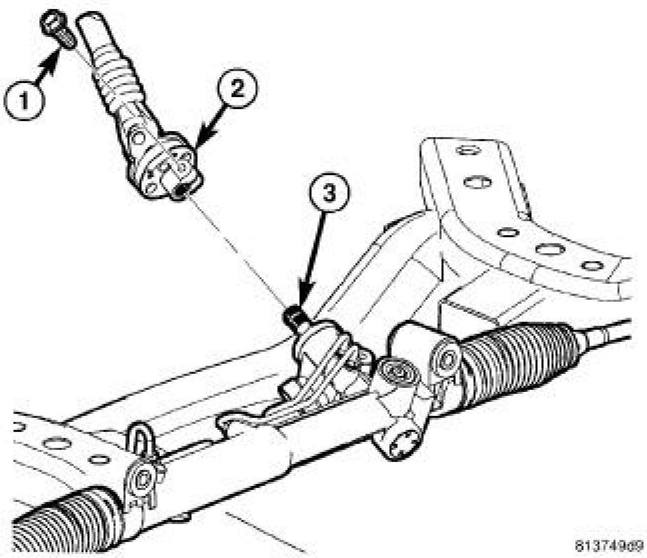
CAUTION: When loosening jam nut and rotating inner tie rod, use care not to twist bellows at inner tie rod. Remove clamp at inner tie rod and make sure bellows moves freely before rotating inner tie rod.

6. Loosen tie rod jam nut (3) on both outer tie rods (5).
7. Remove outer tie rod nut (1) at each knuckle (2).



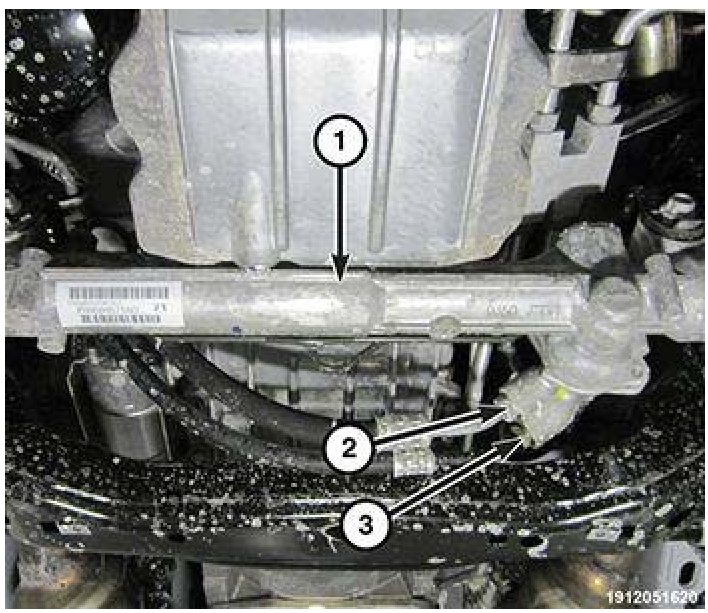
[Fig. 22: Using Puller On Outer Tie Rod](#)
Courtesy of CHRYSLER GROUP, LLC

8. Using Remover (special tool #9360, Remover, Ball Joint) (2), separate outer tie rod (1) from each knuckle.



[Fig. 23: Steering Coupling](#)
Courtesy of CHRYSLER GROUP, LLC

9. Remove lower intermediate shaft pinch bolt (1) at steering gear shaft (3). Separate lower intermediate shaft (2) from steering gear (3).



[Fig. 24: Steering Gear, Pressure Hose & Return Hose](#)
Courtesy of CHRYSLER GROUP, LLC

10. Remove the pressure hose (2) from the steering gear (1).
11. Remove the return hose (3) from the steering gear (1).

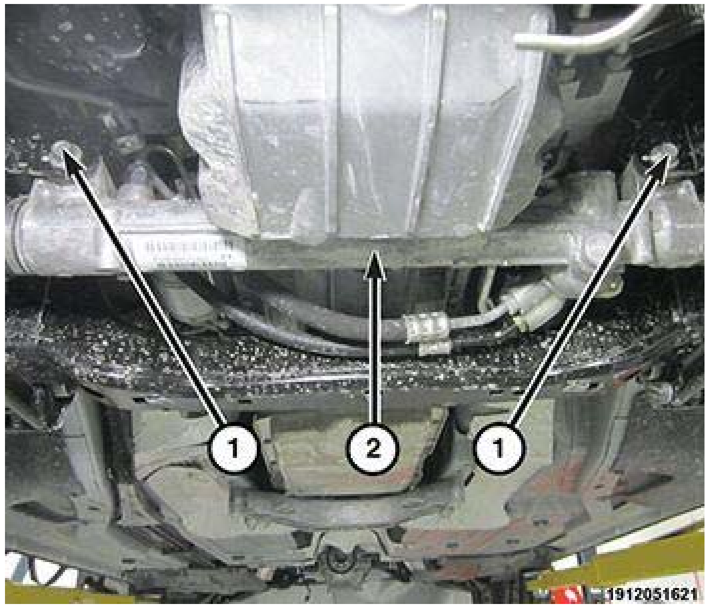


Fig. 25: Steering Gear Assembly & Gear Mounting Bolts
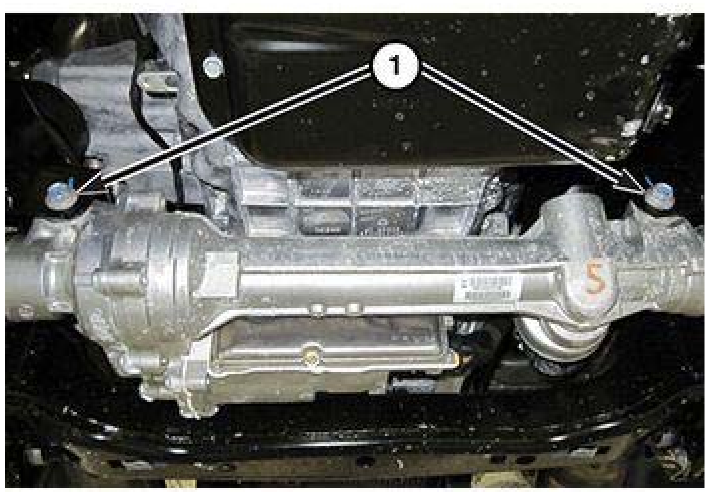
Courtesy of CHRYSLER GROUP, LLC

12. Remove steering gear mounting bolts (1) and the steering gear assembly (2).
13. If necessary, remove outer tie rods from gear. Count number of revolutions off for each tie rod for reference upon installation to replacement gear.

INSTALLATION

ELECTRIC POWER STEERING

1. If removed, install the outer tie rods on the gear.
2. Position the steering gear in the vehicle.



1910048556

Fig. 26: Steering Gear Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Install the steering gear mounting bolts (1). Tighten the steering gear mounting bolts to the proper specification. Refer to **SPECIFICATIONS**.

Fig. 27: Steering Gear Wire Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

4. Install the two black steering gear wire harness connector (1) onto the steering gear.

Fig. 28: Outer Tie Rod Nut
Courtesy of CHRYSLER GROUP, LLC

5. Install the outer tire rod nut (1) at each knuckle. Tighten to the proper specification. Refer to **SPECIFICATIONS**.
6. Install the lower intermediate steering column coupling to steering gear input shaft bolt. Tighten the bolt to the proper specification. Refer to **SPECIFICATIONS**.
7. Remove support and lower the vehicle.

8. Remove the steering wheel holding tool.
9. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.
10. With the key on, engine off turn the steering wheel lock to lock one time to calibrate the EPS gear.

HYDRAULIC POWER STEERING

NOTE: **Full hydraulic power steering shown in illustration, electric hydraulic power steering similar.**

1. If installing outer tie rods from the original gear, install each outer tie rod the same amount of threads as it was installed on original gear.

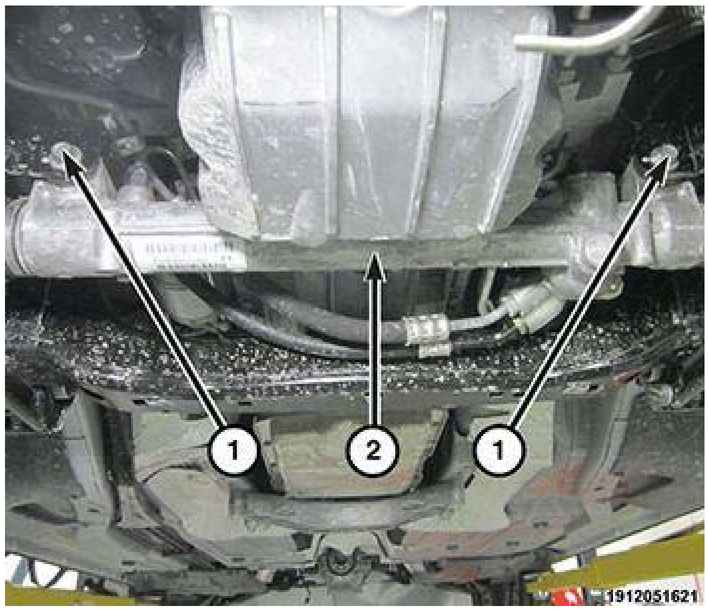


Fig. 29: Steering Gear Assembly & Gear Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Position the steering gear assembly (2) into the vehicle. Install and tighten the steering gear bolts (1) to the proper specification. Refer to **SPECIFICATIONS**.

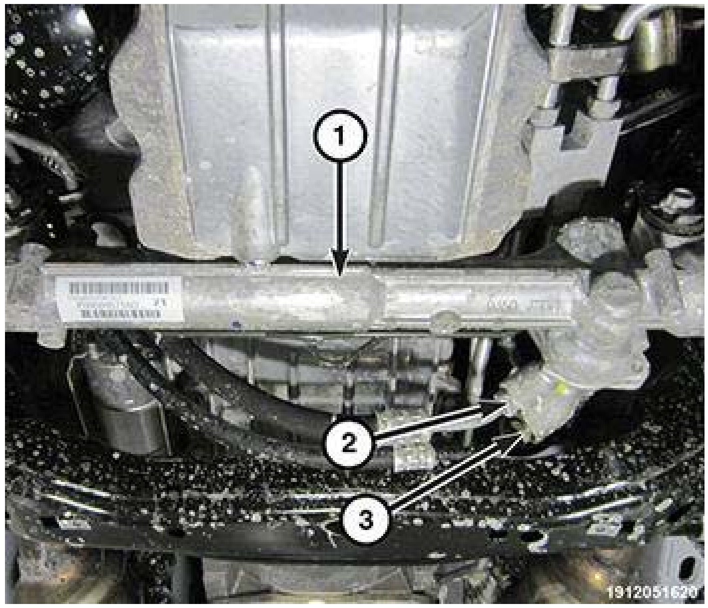

Fig. 30: Steering Gear, Pressure Hose & Return Hose
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Always use a NEW O-ring on the steering hoses.**

3. Using clean power steering fluid, lubricate the **NEW** O-ring on the return hose.
4. Install the return hose (3) to the steering gear (1). Refer to **SPECIFICATIONS**.
5. Using clean power steering fluid, lubricate the **NEW** O-ring on end of pressure hose.
6. Install pressure hose (2) to the steering gear (1). Tighten to the proper specification. Refer to **SPECIFICATIONS**.

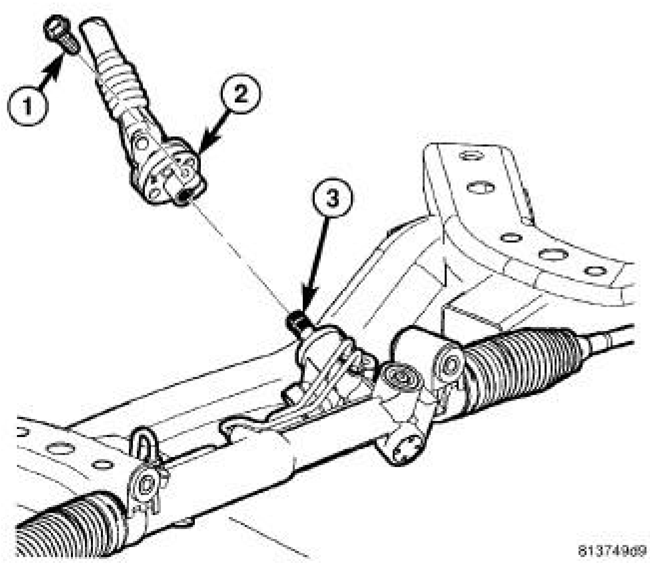

Fig. 31: Steering Coupling
Courtesy of CHRYSLER GROUP, LLC

CAUTION: **Prior to coupling installation, make sure gear is centered in its travel to match clockspring centering in steering column.**

7. Align lower intermediate shaft coupling (2) with input shaft (3). Install the steering coupling using a **NEW** steering coupling pinch bolt. Tighten to the proper specification. Refer to **SPECIFICATIONS**.

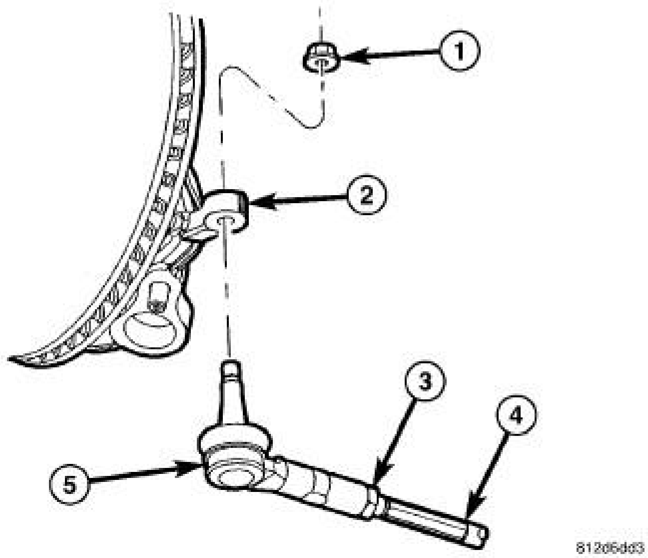

Fig. 32: Front Outer Tie Rod
Courtesy of CHRYSLER GROUP, LLC

8. Install the outer tie rod ends (5) to the knuckles (2). Tighten tie rod end jam nut (3) to the proper specification. Refer to **SPECIFICATIONS**.
9. Install the tire and wheel assembly. Refer to **INSTALLATION** .
10. Remove support and lower the vehicle.
11. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.
12. Fill and bleed power steering system. Refer to **STANDARD PROCEDURE**.
13. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

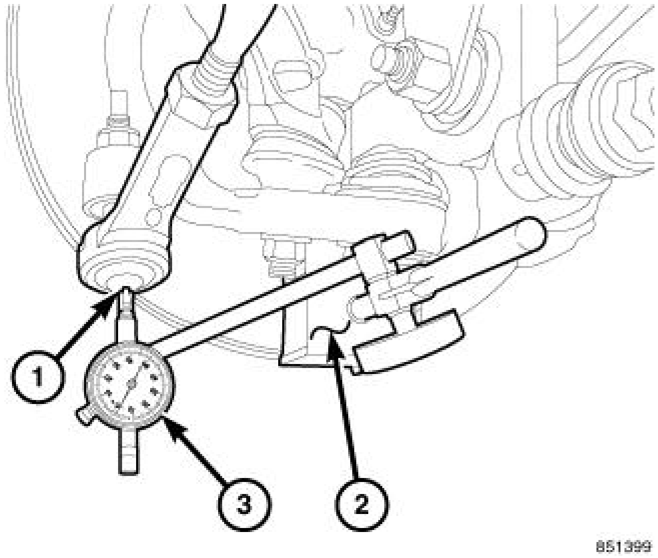
TIE ROD, STEERING

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - TIE ROD

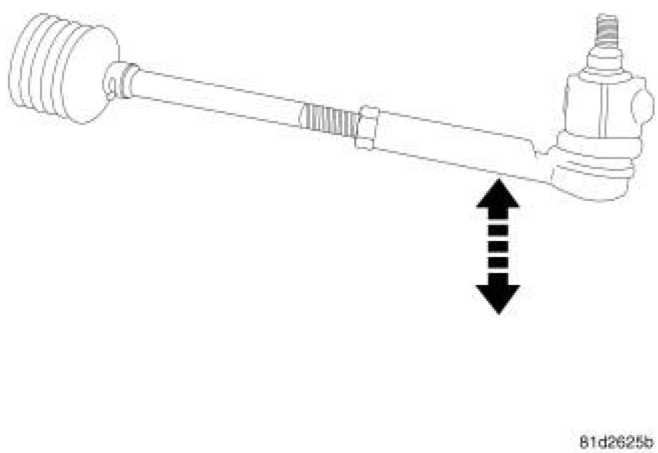
Tie rod free-play can be measured using the following methods:

OUTER TIE ROD



[Fig. 33: Magnetic Dial Indicator]
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the front wheels. Refer to **REMOVAL** .
3. Install two standard wheel mounting nuts, flat side to rotor, diagonally opposite to each on the rotor.
4. Attach a magnetic dial indicator (2) to the inside of the brake rotor, then align dial indicator's contact pointer (1) with direction of stud axis and touch outer tie rod.
5. Zero dial indicator (3).



[Fig. 34: Checking Outer Tie Rod Free-Play]
Courtesy of CHRYSLER GROUP, LLC

NOTE:	**When checking free-play, DO NOT rotate the tie rod. Just because a tie rod rotates easily does not mean that it is necessarily faulty. Using more than light hand pressure will result in a false reading.**

6. Grasp the outer tie rod near the ball stud and attempt to move the tie rod straight up and down using light

hand pressure. (Less than 10 lbs. of force.)

7. Measure and record any tie rod free-play movement.
8. Remove the magnetic dial indicator.
9. Remove the standard wheel mounting nuts from the two studs.
10. If the free-play in the tie rod exceeds 0.05 mm (.002 in.), replace the outer tie rod. Refer to **TIE ROD, STEERING, REMOVAL**. If the free-play is less than 0.05 mm (.002 in.) at the outer tie rod, check the inner tie rod for free-play. See the following procedure:

INNER TIE ROD

NOTE: **Always check and repair (if necessary) outer tie rod free-play before checking inner tie rod free-play. False results can otherwise be obtained.**

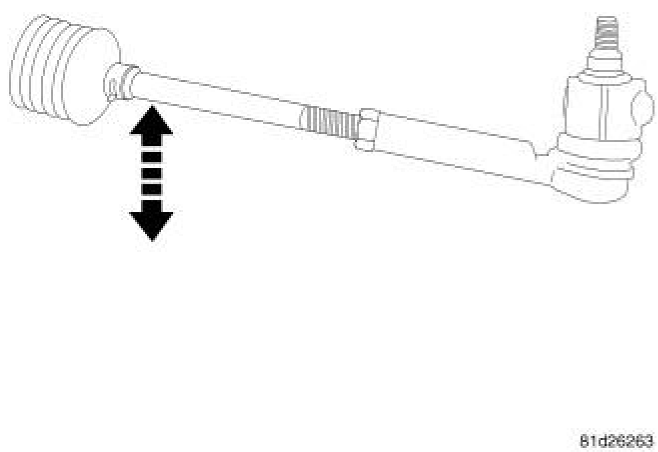


Fig. 35: Checking Inner Tie Rod Free-Play
Courtesy of CHRYSLER GROUP, LLC

1. Grasp the inner tie rod near the steering gear bellows and attempt to move the tie rod straight up and down. If any free-play is felt, replace the inner tie rod. Refer to **TIE ROD, STEERING, REMOVAL**.
2. If no free-play is felt, install the front wheels. Refer to **INSTALLATION** .
3. Remove support and lower the vehicle.

REMOVAL

OUTER TIE ROD

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the tire and wheel assembly. Refer to **REMOVAL** .

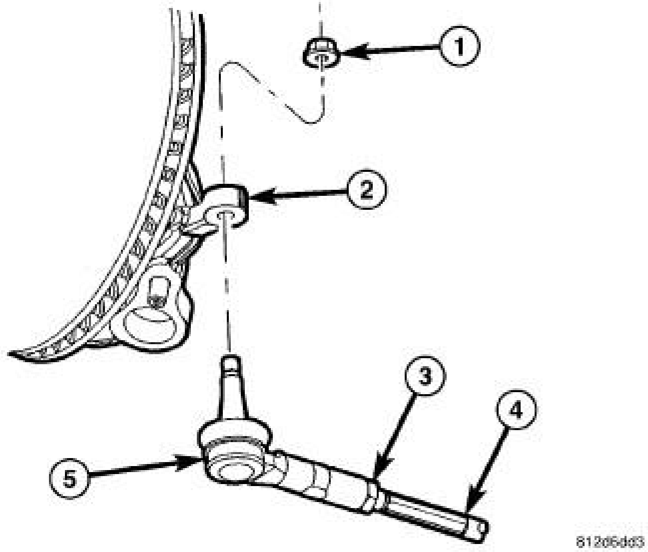

Fig. 36: Front Outer Tie Rod
Courtesy of CHRYSLER GROUP, LLC

CAUTION: **When loosening jam nut and rotating inner tie rod, use care not to twist bellows at inner tie rod. Remove clamp at inner tie rod and make sure bellows moves freely before rotating inner tie rod.**

3. Loosen tie rod jam nut (3) at outer tie rod (5).
4. Remove outer tie rod end nut (1) at knuckle (2).

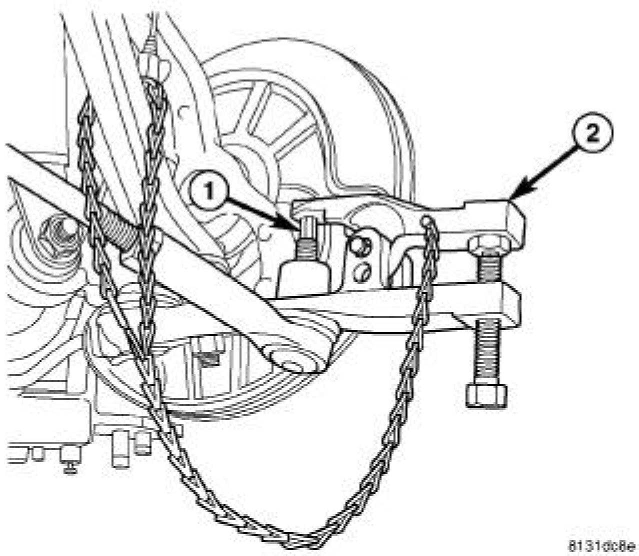

Fig. 37: Using Puller On Outer Tie Rod
Courtesy of CHRYSLER GROUP, LLC

5. Using Remover (special tool #9360, Remover, Ball Joint) (2), separate outer tie rod end (1) from knuckle.
6. Unthread outer tie rod from inner tie rod. **Count number of turns when removing outer tie rod. This will give a good starting point when reassembling and when setting toe.**

INNER TIE ROD

1. Remove outer tie rod. Refer to **TIE ROD, STEERING, REMOVAL**.
2. Remove tie rod jam nut from inner tie rod.

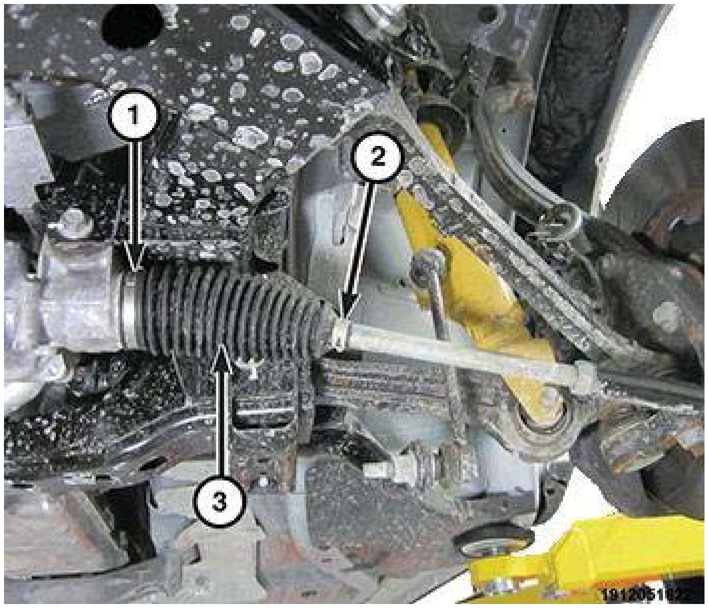

Fig. 38: Clamps & Bellows
Courtesy of CHRYSLER GROUP, LLC

3. Remove clamp (1) securing bellows (3) to inner tie rod.
4. Remove clamp (2) securing bellows (3) to steering gear body.
5. Remove bellows (3).

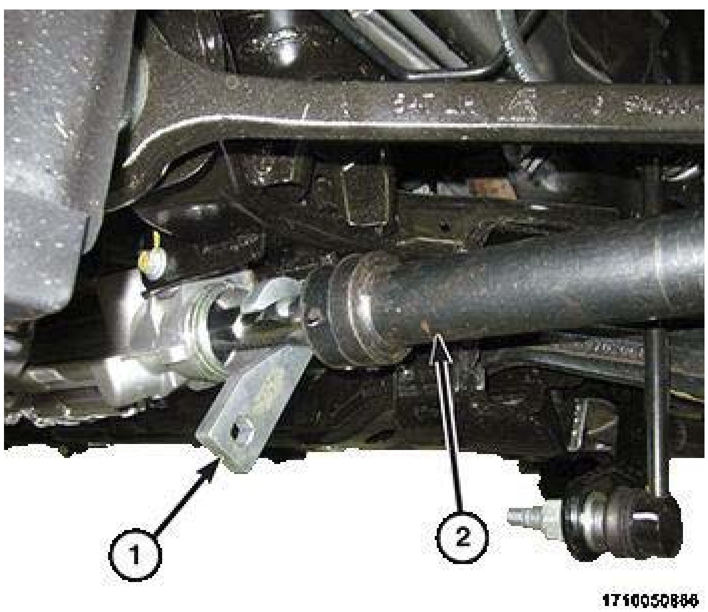

Fig. 39: Inner Tie Rod & Special Tool
Courtesy of CHRYSLER GROUP, LLC

6. Install the (special tool #10417, Holder, EPS Steering Rack) (1) on the LH inner tie rod. Using a suitable

tool (2), remove the inner tie rod.

CAUTION: If inner tie rod cannot be removed using specified tools, do not use a hammer or heat to loosen. Damage to steering gear will occur. Replace entire steering gear.

7. Unthread and remove inner tie rod (2).

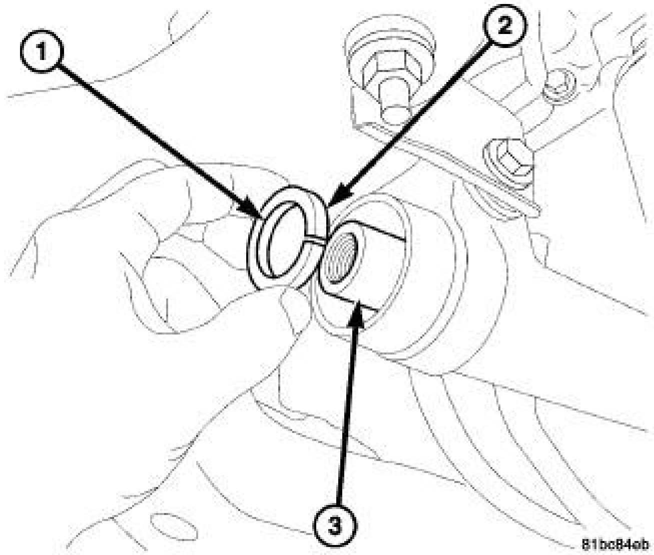

Fig. 40: Restrictor Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

8. Remove travel restrictor (2) from rack gear (3).

INSTALLATION

INNER TIE ROD

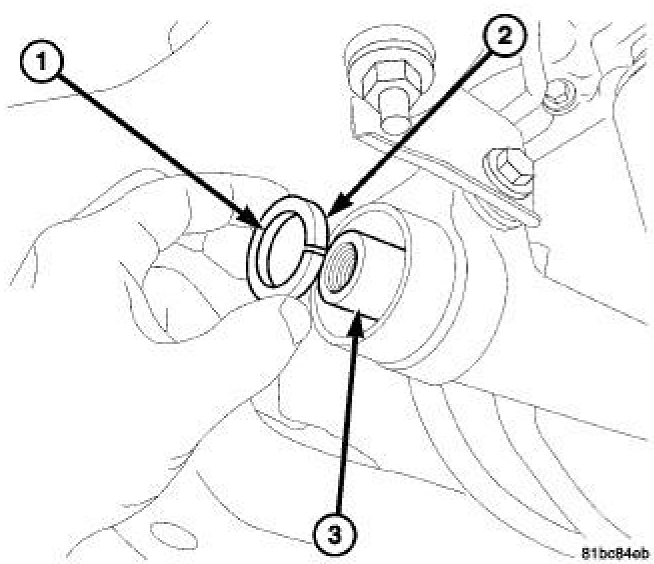

Fig. 41: Restrictor Removal/Installation

Courtesy of CHRYSLER GROUP, LLC

NOTE: **The travel restrictor (2) has a beveled lip (1) on one end of its inside diameter to keep the restrictor from being install too far onto the rack gear. Install the restrictor with the beveled lip side outward (away from gear) to avoid misinstallation and restrictor damage.**

1. Install travel restrictor (2), beveled lip (1) side outward, on end of rack gear (3). Once installed, restrictor will be flush with end of rack gear.
2. Apply MoparÂ® Lock and Seal Adhesive or equivalent medium thread locker adhesive to inboard end threads of inner tie rod.

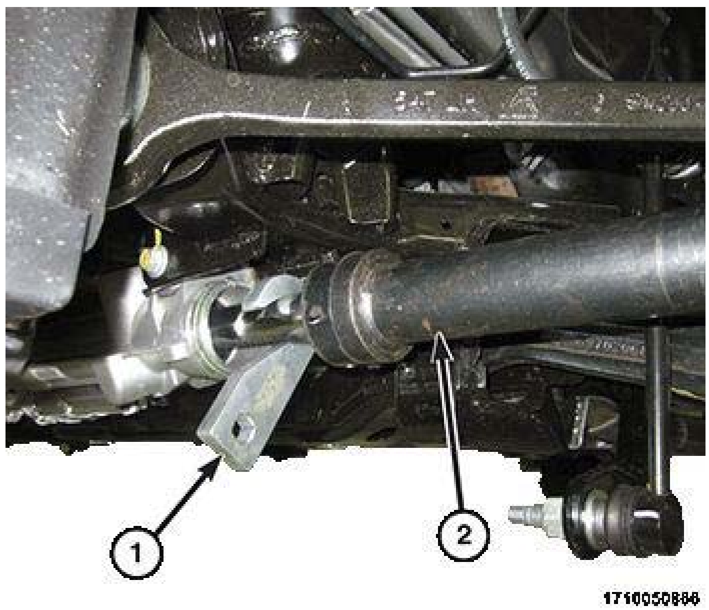

Fig. 42: Inner Tie Rod & Special Tool
Courtesy of CHRYSLER GROUP, LLC

3. Install the inner tie rod, then install the (special tool #10417, Holder, EPS Steering Rack) (1) on the LH inner tie rod. Using a suitable tool (2), install the inner tie rod.
4. Loosely place a new clamp over large end of bellows.

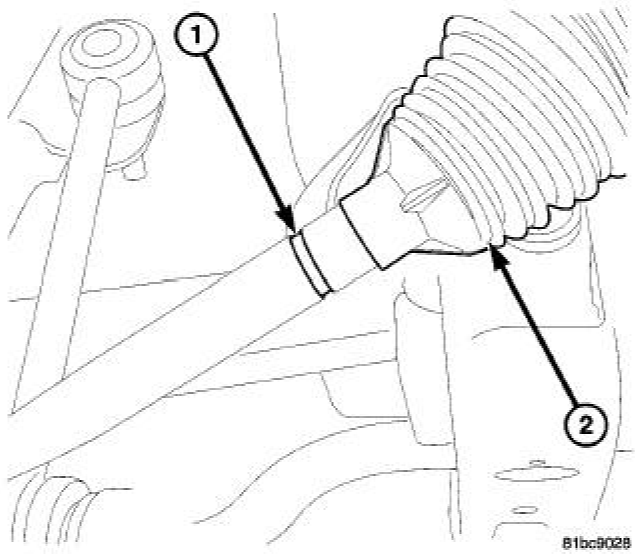

Fig. 43: Groove In Inner Tie Rod
Courtesy of CHRYSLER GROUP, LLC

5. Apply a small amount of MoparÃ® Lubriplate or equivalent uniformly to groove (1) in inner tie rod shaft. This allows for toe adjustment without twisting bellows.
6. Slide new bellows with clamp over end of inner tie rod and onto gear body.
7. Push small end of bellows (2) until ridge inside bellow engages groove (1) machined into inner tie rod.

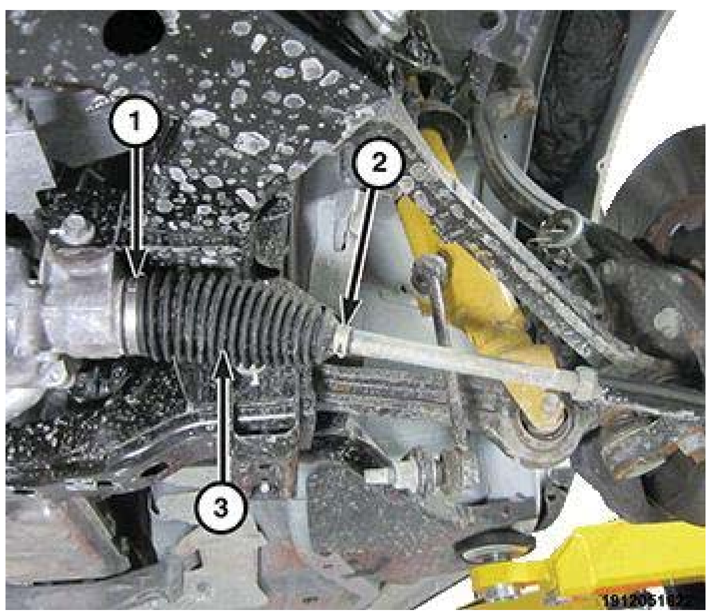

Fig. 44: Clamps & Bellows
Courtesy of CHRYSLER GROUP, LLC

8. Install new clamp (1) over small end of bellows (3).
9. Using crimping pliers, crimp bellows clamp (1) at gear body.
10. Thread tie rod jam nut onto inner tie rod far enough to install outer tie rod.
11. Install outer tie rod. Refer to **TIE ROD, STEERING, INSTALLATION**.

OUTER TIE ROD

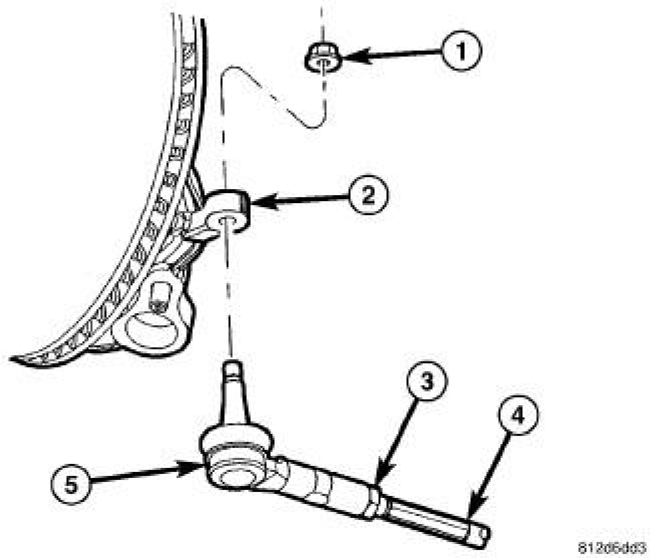

Fig. 45: Front Outer Tie Rod
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When rotating inner tie rod, use care not to twist bellows at inner tie rod. Remove clamp at inner tie rod and make sure bellows moves freely before rotating inner tie rod.

1. Thread outer tie rod (5) onto inner tie rod (4). Install outer tie rod using same number of turns as when removed.
2. Install outer tie rod end (5) into steering knuckle (2). Install and tighten the outer tie rod ball joint nut (1) to the proper specification. Refer to **SPECIFICATIONS**.
3. Tighten the tie rod jam nut (3) to the proper specification. Refer to **SPECIFICATIONS**.
4. Install the tire and wheel assembly. Refer to **INSTALLATION** .
5. Remove the support and lower the vehicle.
6. Perform wheel alignment setting toe to specifications. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

PUMP

DESCRIPTION

HYDRAULIC POWER STEERING

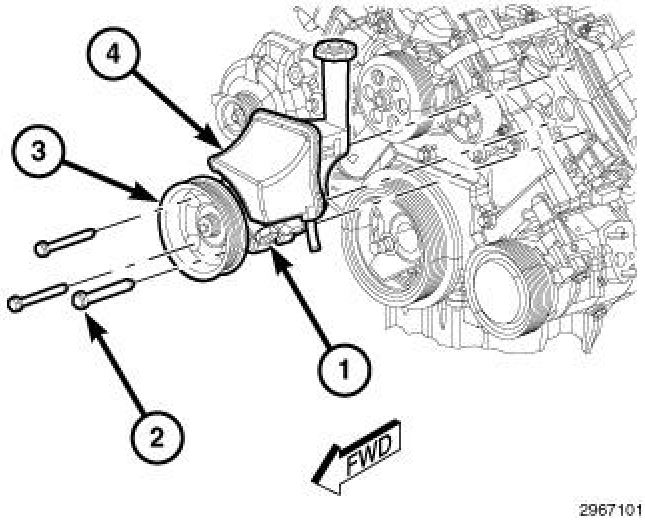

Fig. 46: Power Steering Reservoir, Pump, Pulley & Bolts
Courtesy of CHRYSLER GROUP, LLC

Hydraulic pressure for operation of the power steering gear is provided by a belt-driven all-aluminum power steering pump. Vehicles use a constant displacement type pump that is mounted to the left front of engine. The power steering reservoir (4) is integrated with the power steering pump.

DIAGNOSIS AND TESTING

POWER STEERING PUMP AND HOSES

NOTE: This information is designed to be used in conjunction with the diagnostic charts at the beginning of the Steering Service Information. Refer to DIAGNOSIS AND TESTING.

CHECKING FOR WEAR OF POWER STEERING PUMP INTERNAL COMPONENTS

1. Place gear selector in PARK (or NEUTRAL) with wheels chalked.
2. With the engine idling, have a helper turn the steering wheel.
3. Using an electronic listening tool, determine if noise is coming from the pump.
4. Increase the engine speed and have a helper turn the steering wheel. Does the noise change with load?
5. Replace the power steering pump if excessive noise is present. Refer to PUMP, REMOVAL.

CHECKING FOR POWER STEERING HOSES TOUCHING BODY OR FRAME OF VEHICLE

Check hoses and hose tubes as following:

- Inspect hoses and hose tubes for witness marks. If witness marks are present, adjust hose(s) to the proper position by loosening, repositioning and tightening attachments to the specified torque. Refer to SPECIFICATIONS. **Do not bend tubing to adjust.** Replace the hose assembly if damaged.
- Check fastener torque of hose mounting brackets and tube nuts. Refer to SPECIFICATIONS.
- Have a helper bump the steering gear off of the stops to induce pressure fluctuations which may move the hose. If hose contact is made, adjust hose(s) to the proper position by loosening, repositioning and tightening attachments to the specified torque. Refer to SPECIFICATIONS. **Do not bend tubing to**

adjust. Replace the hose assembly if damaged.

PUMP LEAKAGE

The pump is serviced as an assembly and should not be disassembled.

Check for leaks in the following areas:

- Pump shaft seal behind the pulley
- Pressure and return lines
- Flow control valve fitting

REMOVAL

HYDRAULIC POWER STEERING

1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
2. Siphon power steering fluid from pump reservoir.
3. Remove air filter housing. Refer to **BODY, AIR CLEANER, REMOVAL, 3.6L** , **BODY, AIR CLEANER, REMOVAL, 5.7L** , **BODY, AIR CLEANER, REMOVAL, 6.2L** or **BODY, AIR CLEANER, REMOVAL, 6.4L** .
4. Remove serpentine drive belt. Refer to **BELT, SERPENTINE, REMOVAL** .

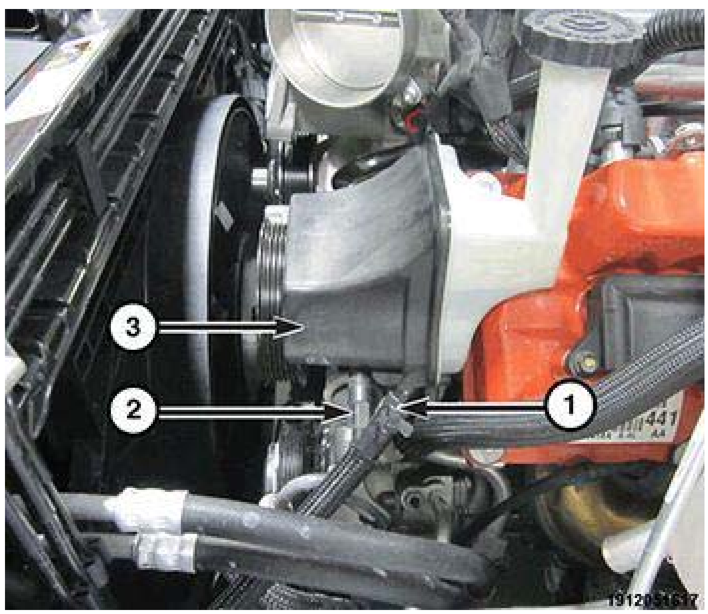

Fig. 47: Supply Hose, Pressure Hose & Power Steering Pump
Courtesy of CHRYSLER GROUP, LLC

5. Loosen the hose clamp, then remove the supply hose (1) from power steering pump (3).
6. Remove the pressure hose (2) from power steering pump (3).

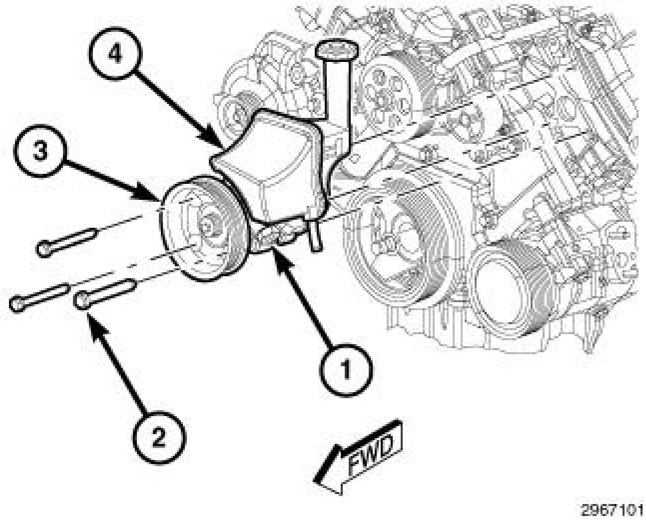

Fig. 48: Power Steering Reservoir, Pump, Pulley & Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Remove the three power steering pump bolts (2) through the access holes in pulley (3).
8. Remove the power steering pump (1) from engine.
9. If necessary, remove the power steering pump pulley. Refer to **PULLEY, POWER STEERING PUMP, REMOVAL**.

INSTALLATION

HYDRAULIC POWER STEERING

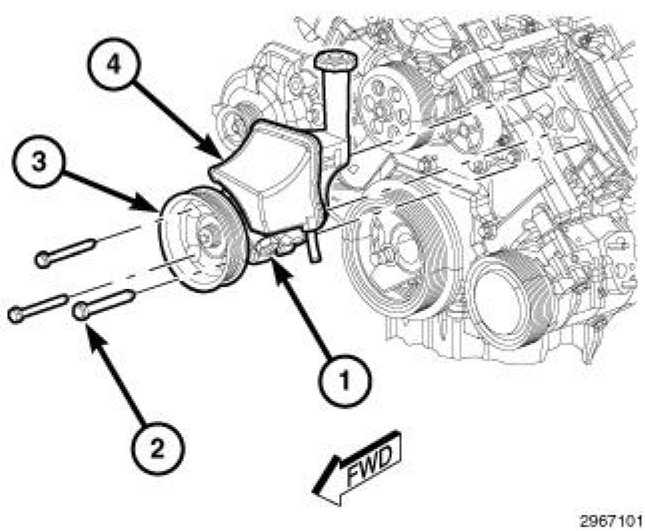

Fig. 49: Power Steering Reservoir, Pump, Pulley & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Align the power steering pump (1) with mounting holes on engine.
2. Install the three power steering pump bolts (2). Tighten bolts to the proper specification. Refer to **SPECIFICATIONS**.

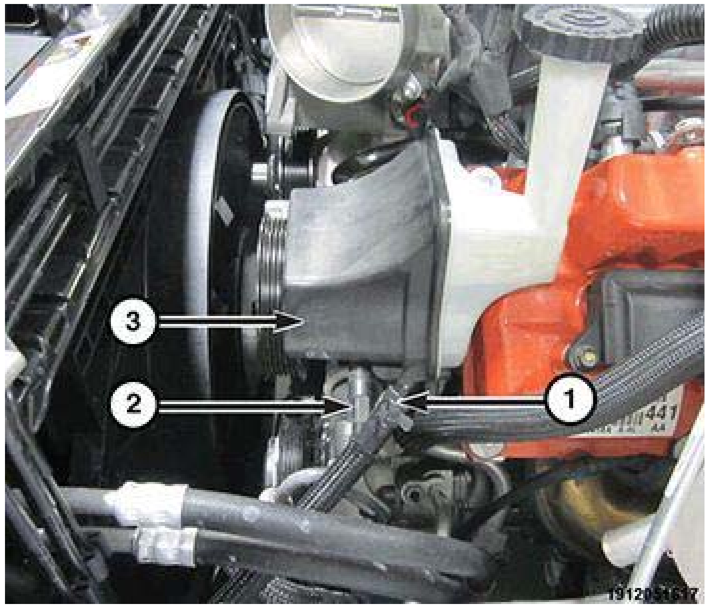

Fig. 50: Supply Hose, Pressure Hose & Power Steering Pump
Courtesy of CHRYSLER GROUP, LLC

NOTE: Always use a NEW O-ring on the end of the pressure hose.

3. Lubricate **NEW** O-ring on end of pressure hose with clean power steering fluid.
4. Install pressure hose (2) to power steering pump (3). Tighten pressure hose tube nut to the proper specification. Refer to **SPECIFICATIONS**.
5. Install the power steering pump return hose (1) and securely tighten the clamp.
6. Install serpentine drive belt. Refer to **BELT, SERPENTINE, INSTALLATION** .
7. Install the air cleaner housing. Refer to **BODY, AIR CLEANER, INSTALLATION, 3.6L** , **BODY, AIR CLEANER, INSTALLATION, 5.7L** , **BODY, AIR CLEANER, INSTALLATION, 6.2L** or **BODY, AIR CLEANER, INSTALLATION, 6.4L** .
8. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.
9. Fill and bleed power steering system. Refer to **STANDARD PROCEDURE**.

COOLER, POWER STEERING

DESCRIPTION

HYDRAULIC POWER STEERING

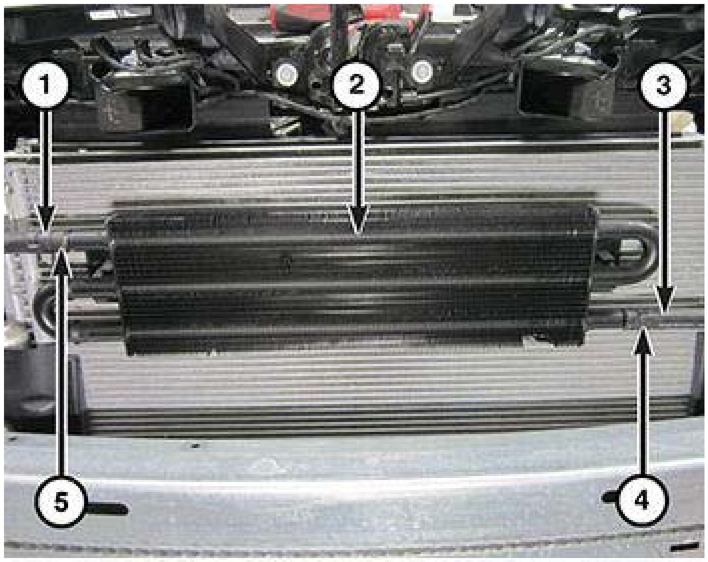

Fig. 51: Power Steering Fluid Cooler Components
Courtesy of CHRYSLER GROUP, LLC

This vehicle uses a fluid-to-air type power steering fluid cooler (2) with external cooling fins. The cooler mounts to clips attached to the front of the cooling module.

The 6.2L Hellcat is the only application with a power steering cooler.

REMOVAL

SRT

1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
2. Siphon power steering fluid from pump reservoir.
3. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
4. Remove the front fascia. Refer to **FASCIA, FRONT, REMOVAL** .

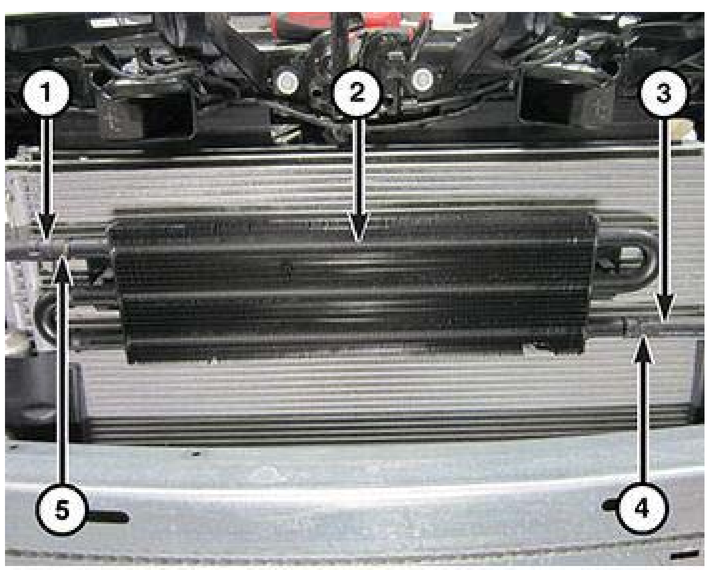

Fig. 52: Power Steering Fluid Cooler Components
Courtesy of CHRYSLER GROUP, LLC

5. Loosen the hose clamp (1) and remove the cooler hose (5) from the cooler (2).
6. Loosen the hose clamp (4) and remove the cooler hose (3) from the cooler (2).

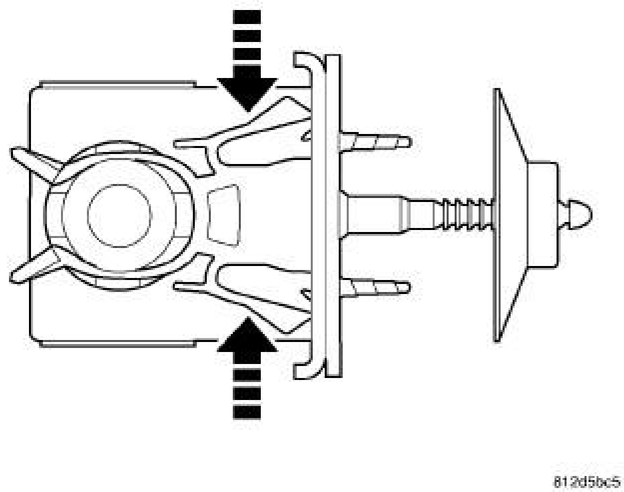

Fig. 53: Cooler Retainer Clips
Courtesy of CHRYSLER GROUP, LLC

7. Push in on cooler mounting clip tabs.
8. Remove cooler from clips mounted to cooling module.

INSTALLATION

SRT

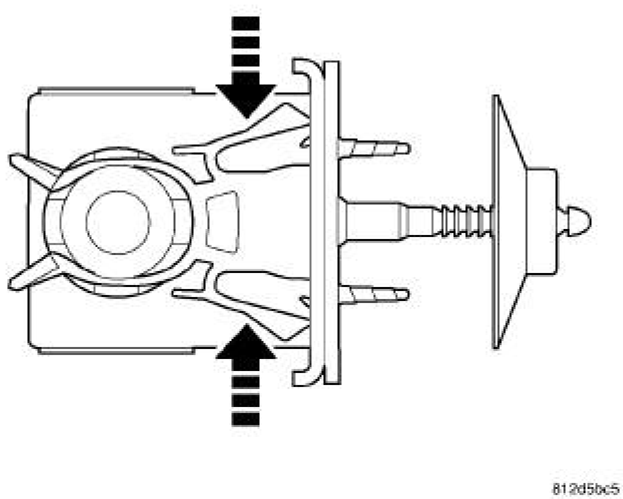

Fig. 54: Cooler Retainer Clips

Courtesy of CHRYSLER GROUP, LLC

1. Install center tube of cooler over mounting clips attached to cooling module. Push cooler past clip retaining tabs allowing it to lock into place.

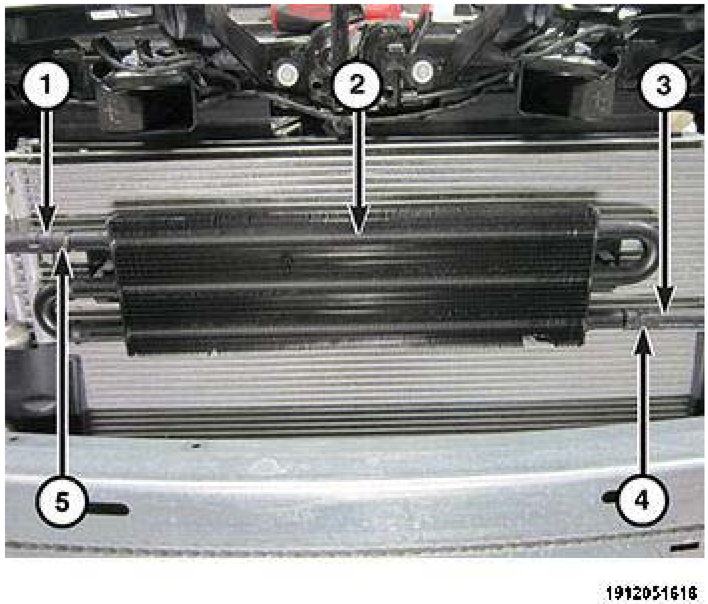

Fig. 55: Power Steering Fluid Cooler Components
Courtesy of CHRYSLER GROUP, LLC

2. Install the hose on (3) on the cooler (2) and securely tighten the clamp (4).
3. Install the hose clamp (5) on the cooler (2) and securely tighten the clamp.
4. Install the front fascia. Refer to **FASCIA, FRONT, INSTALLATION** .
5. Remove support and lower the vehicle.
6. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.
7. Fill and bleed power steering system. Refer to **STANDARD PROCEDURE**.

FLUID

DESCRIPTION

DESCRIPTION

The recommended fluid for the power steering system is MoparÃ® Hydraulic System Power Steering Fluid (MS-10838).

MoparÃ® Hydraulic System Power Steering Fluid, when new, is amber in color. MoparÃ® Hydraulic System Power Steering Fluid is dyed amber so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The amber color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, MoparÃ® Hydraulic System Power Steering Fluid will begin to look darker in color and may eventually become brown. **THIS IS NORMAL.** Consequently, odor and color cannot be used to indicate the fluid condition or the need for a fluid change.

STANDARD PROCEDURE

POWER STEERING FLUID LEVEL CHECKING

WARNING: **Fluid level should be checked with the engine OFF to prevent personal injury from moving parts and to assure an accurate fluid level reading.**

CAUTION: **MoparÂ® Hydraulic System Power Steering Fluid MS-10838 is to be used in the power steering system. No other power steering is to be used in the system. Damage may result to the power steering pump and system if another fluid is used. Do not overfill the system.**

NOTE: **Although not required at specific intervals, the fluid level may be checked periodically. Check the fluid level anytime there is a system noise or fluid leak suspected.**

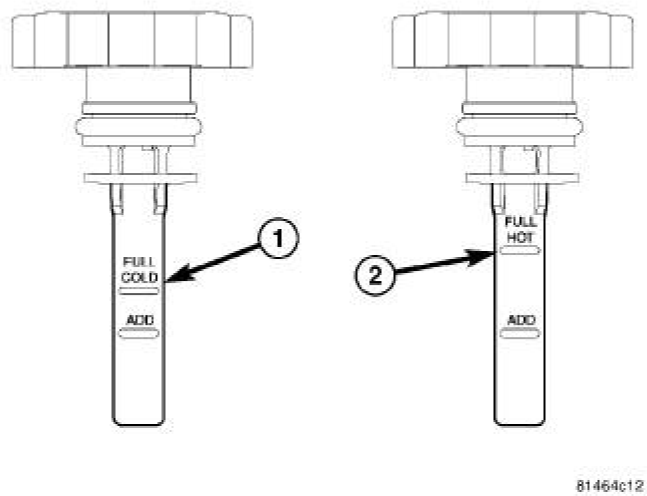

Fig. 56: Cold & Hot Sides Of Dipstick
Courtesy of CHRYSLER GROUP, LLC

The power steering fluid level can be viewed on the dipstick attached to the filler cap. There are two sides to the dipstick, one is for checking the fluid when it is cold, the other is for checking the fluid when it is hot. Before opening the power steering system, wipe the reservoir filler cap free of dirt and debris. Remove the cap and check the fluid level on its dipstick.

Use the COLD side of the dipstick (1) to measure when the fluid is at normal ambient temperature, approximately 21Â°C to 27Â°C (70Â°F to 80Â°F). The fluid level should read between the ADD and FULL COLD lines.

Use the HOT side of the dipstick (2) to measure when the vehicle has been running and the fluid is hot. When the fluid is hot, the fluid level is allowed to read up to the FULL HOT line. **Only add fluid to the system when the vehicle is cold.**

Use only MoparÂ® Hydraulic System Power Steering Fluid (MS-10838) in the power steering system. Do not overfill the power steering system.

HOSE, POWER STEERING, PRESSURE

REMOVAL

HYDRAULIC POWER STEERING

1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
2. Siphon power steering fluid from pump reservoir.
3. Remove air cleaner and inlet tube. Refer to **BODY, AIR CLEANER, REMOVAL, 3.6L** , **BODY, AIR CLEANER, REMOVAL, 5.7L** , **BODY, AIR CLEANER, REMOVAL, 6.2L** or **BODY, AIR CLEANER, REMOVAL, 6.4L** .

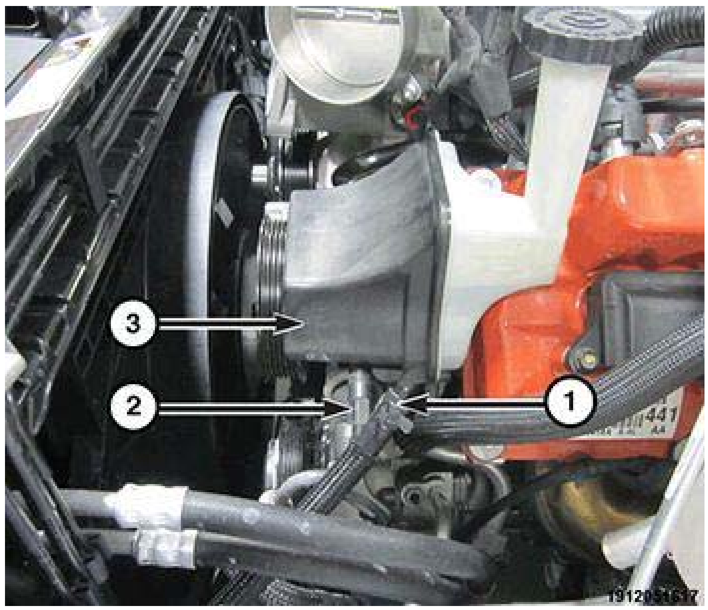

Fig. 57: Supply Hose, Pressure Hose & Power Steering Pump
Courtesy of CHRYSLER GROUP, LLC

4. Remove power steering pressure hose (2) from the power steering pump (3).
5. Raise and support vehicle. Refer to **MAINTENANCE SCHEDULES, DESCRIPTION** .
6. Remove belly pan. Refer to **BELLY PAN, REMOVAL** and **BELLY PAN, ENGINE, REMOVAL** .

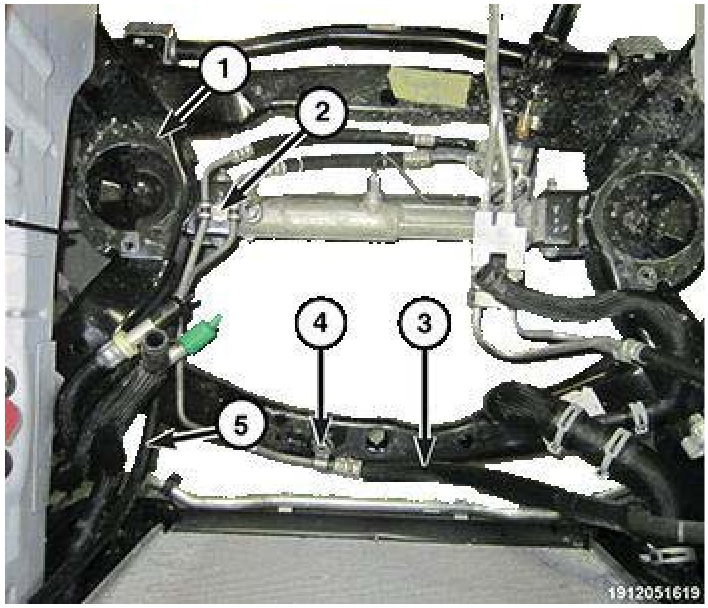

Fig. 58: Engine Cradle, Fasteners, Pressure Hose & Return Hose
Courtesy of CHRYSLER GROUP, LLC

7. Remove the fastener (4) securing power steering pressure hose (3) to the front of engine cradle (1).
8. Remove screw (2) fastening routing clamps securing pressure (3) and return (5) hoses to right side of engine cradle (1).

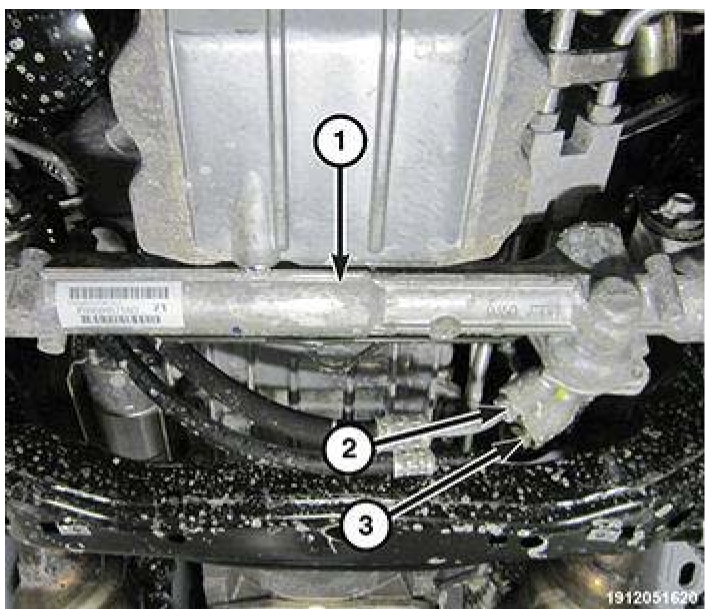

Fig. 59: Steering Gear, Pressure Hose & Return Hose
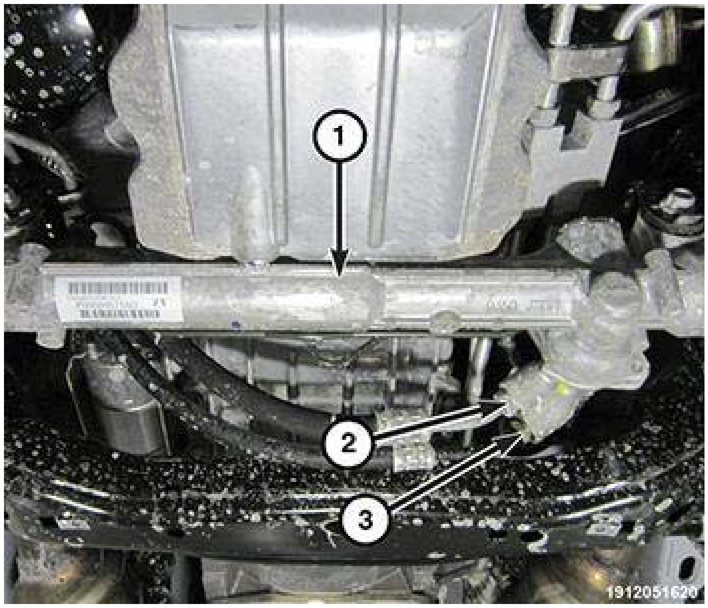
Courtesy of CHRYSLER GROUP, LLC

9. Remove the power steering pressure hose (2) from the steering gear (1).
10. Remove power steering pressure hose from vehicle.

INSTALLATION

HYDRAULIC POWER STEERING

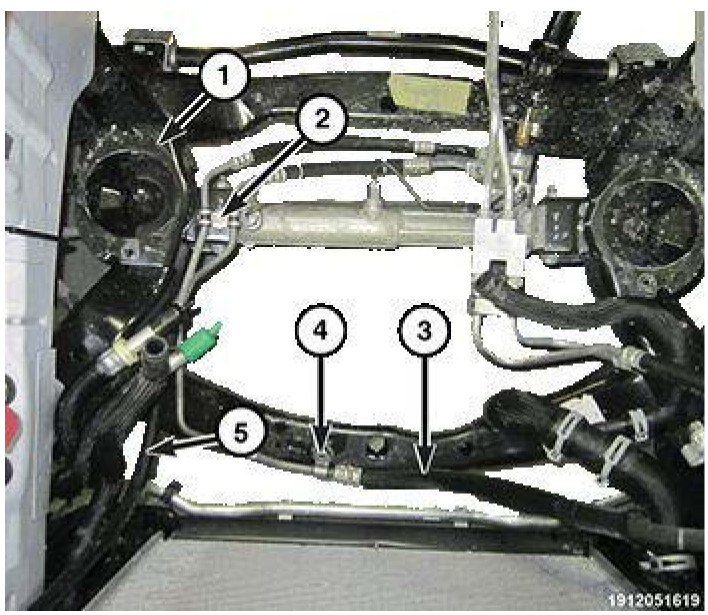


[Fig. 60: Steering Gear, Pressure Hose & Return Hose]
Courtesy of CHRYSLER GROUP, LLC

1. Install pressure hose in engine compartment from underneath.

NOTE: **Always use a NEW O-ring on the end of the pressure hose.**

2. Lubricate new O-ring on steering gear end of pressure hose with clean power steering fluid.
3. Install pressure hose (2) to steering gear (1). **Do not tighten tube nut at this time.**



[Fig. 61: Engine Cradle, Fasteners, Pressure Hose & Return Hose]
Courtesy of CHRYSLER GROUP, LLC

4. Route pressure hose along right side of engine cradle. Position pressure hose (3) routing clamp over return hose (5) routing clamp, then install screw (2) securing hoses to right side of engine cradle (1).
5. Route pressure hose along front of engine cradle. Install screw (4) through routing clamp securing hose to front of engine cradle (1).

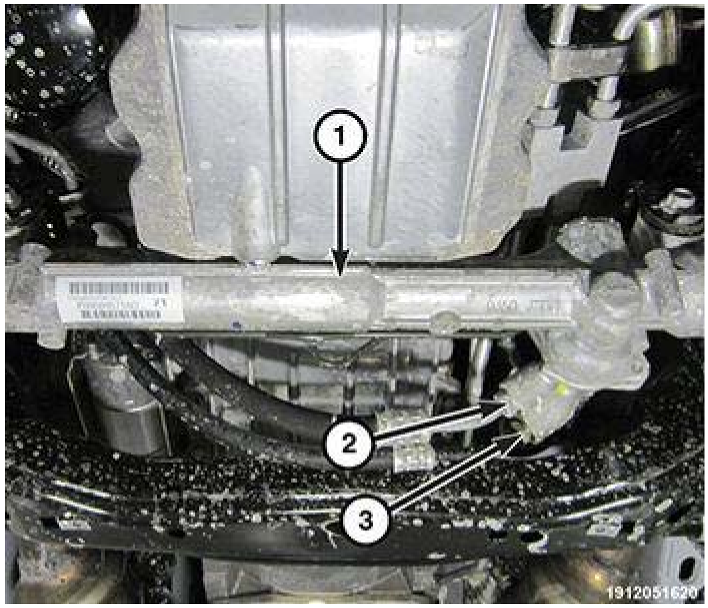


Fig. 62: Steering Gear, Pressure Hose & Return Hose
Courtesy of CHRYSLER GROUP, LLC

6. Tighten power steering pressure hose nut (2) at steering gear to the proper specification. Refer to **SPECIFICATIONS**.
7. Install belly pan. Refer to **BELLY PAN, INSTALLATION** and **BELLY PAN, ENGINE, INSTALLATION** .
8. Remove support and lower the vehicle.

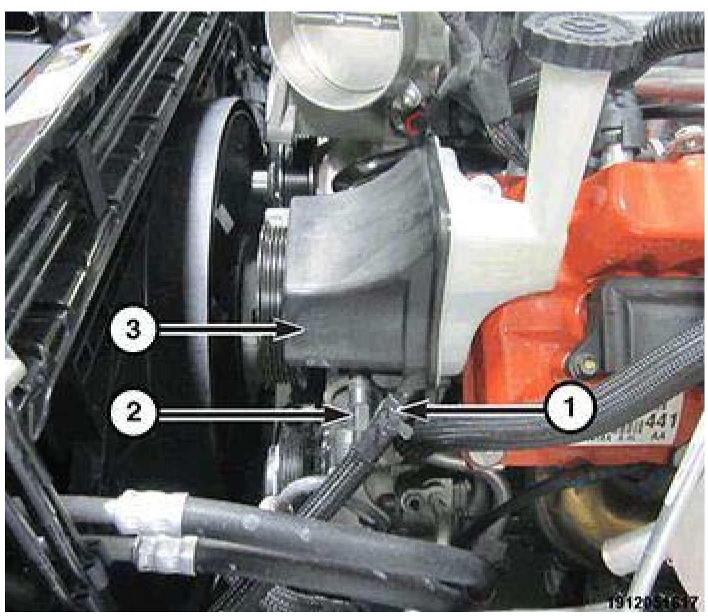

Fig. 63: Supply Hose, Pressure Hose & Power Steering Pump
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Always use a**

NEW

O-ring on the end of the pressure hose.

9. Lubricate new O-ring on power steering pump end of pressure hose with clean power steering fluid.
10. Install power steering pressure hose (2) to pump (3). Tighten power steering pressure hose nut to the proper specification. Refer to **SPECIFICATIONS**.
11. Install the air cleaner body and inlet tube. Refer to **BODY, AIR CLEANER, INSTALLATION, 3.6L** , **BODY, AIR CLEANER, INSTALLATION, 5.7L** , **BODY, AIR CLEANER, INSTALLATION, 6.2L** or **BODY, AIR CLEANER, INSTALLATION, 6.4L** .
12. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.
13. Fill and bleed power steering system. Refer to **STANDARD PROCEDURE**.

HOSE, POWER STEERING, RETURN

REMOVAL

COOLER TO RESERVOIR - 6.2L

1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
2. Siphon power steering fluid from pump reservoir.
3. Remove the air cleaner. Refer to **BODY, AIR CLEANER, REMOVAL, 6.2L** .

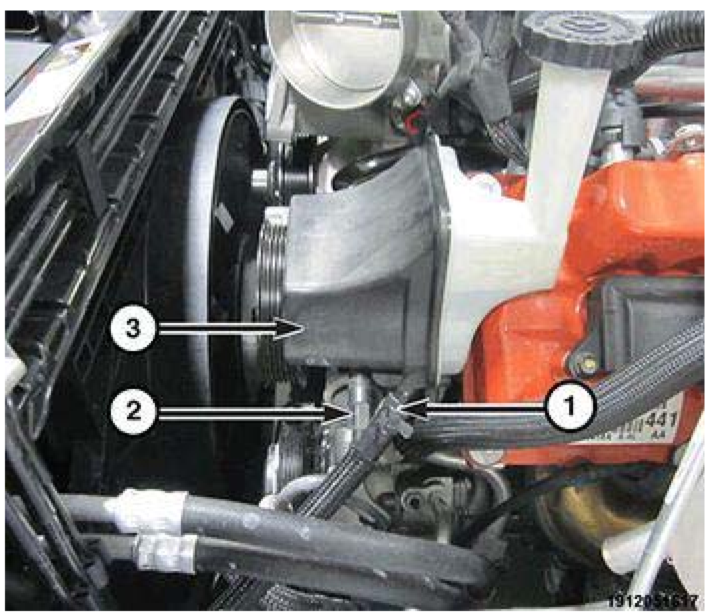

Fig. 64: Supply Hose, Pressure Hose & Power Steering Pump
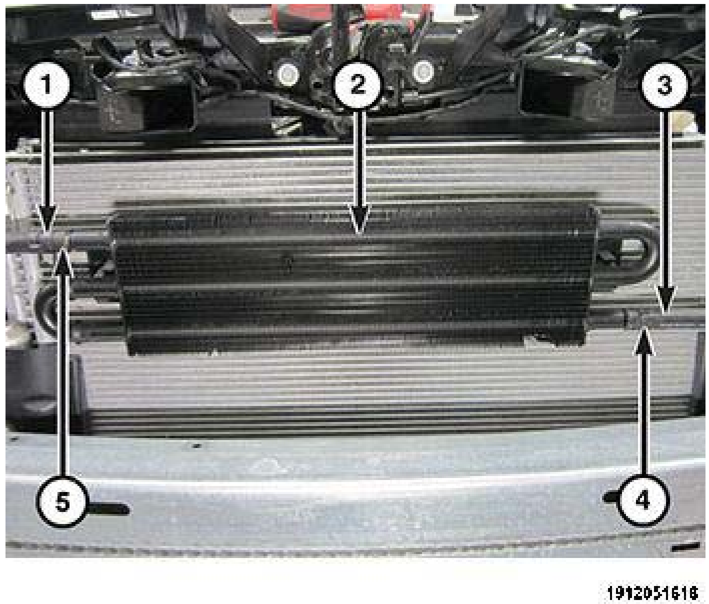
Courtesy of CHRYSLER GROUP, LLC

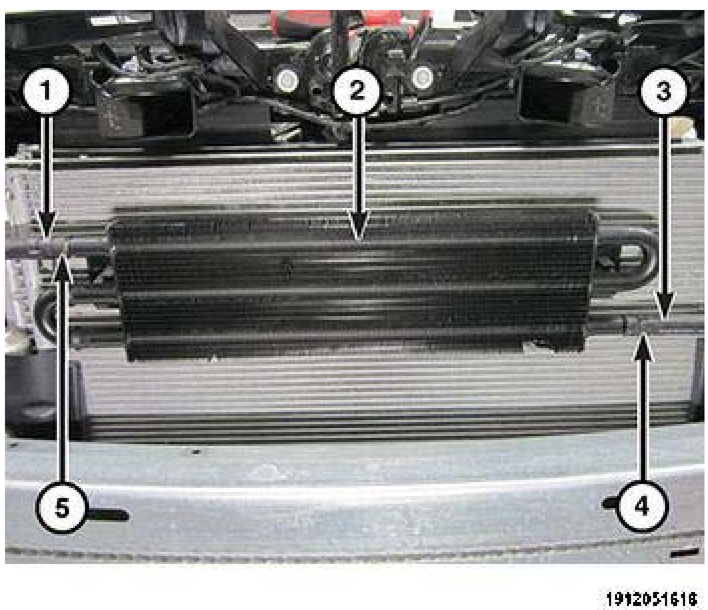
4. Loosen the hose clamp and remove the power steering return hose (1).
5. Remove upper radiator closeout panels.



[Fig. 65: Power Steering Fluid Cooler Components](#)
Courtesy of CHRYSLER GROUP, LLC

6. Loosen the hose clamp (4) and remove power steering return hose (3) at cooling module (2).
7. Remove return hose from routing clip on headlamp mounting crossmember.
8. Remove the power steering return hose from the vehicle.

GEAR TO COOLER - 6.2L



[Fig. 66: Power Steering Fluid Cooler Components](#)
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
2. Remove the radiator closeout panels.
3. Loosen the steering gear to cooler hose clamp (1) and remove the steering gear to cooler hose. (5).

4. Siphon the power steering fluid from the power steering pump reservoir.
5. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
6. Remove the belly pan. Refer to **BELLY PAN, REMOVAL** and **BELLY PAN, ENGINE, REMOVAL** .

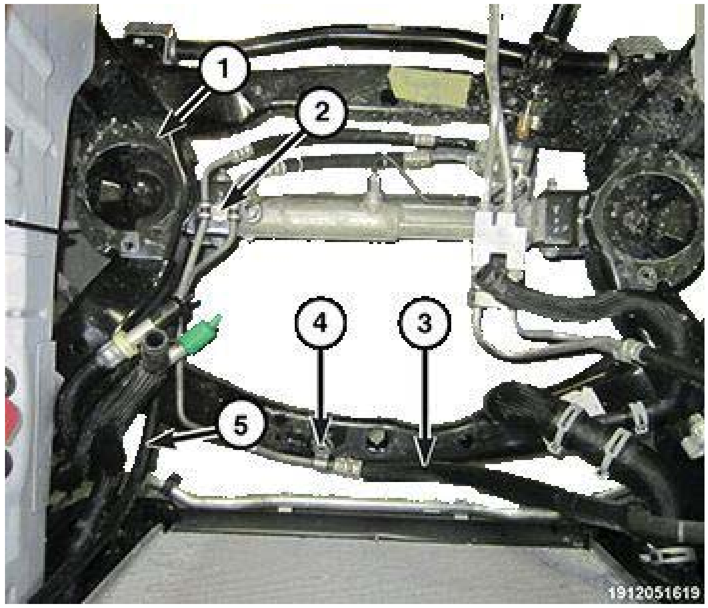


Fig. 67: Engine Cradle, Fasteners, Pressure Hose & Return Hose
Courtesy of CHRYSLER GROUP, LLC

7. Remove the fastener (2) securing power steering pressure hose (3) and power steering return hose (5) to the engine cradle (1).

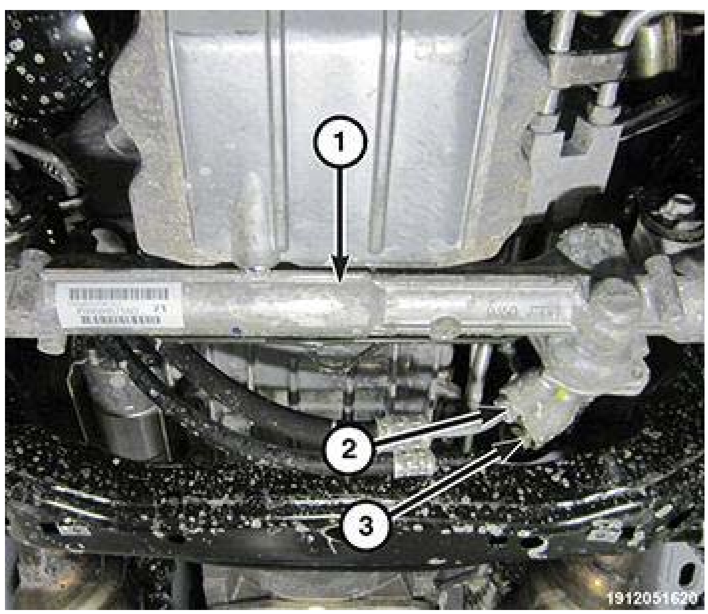

Fig. 68: Steering Gear, Pressure Hose & Return Hose
Courtesy of CHRYSLER GROUP, LLC

8. Remove the power steering return hose nut (3) from the steering gear (1) and remove the power steering return hose from the vehicle.

INSTALLATION

COOLER TO RESERVOIR - 6.2L

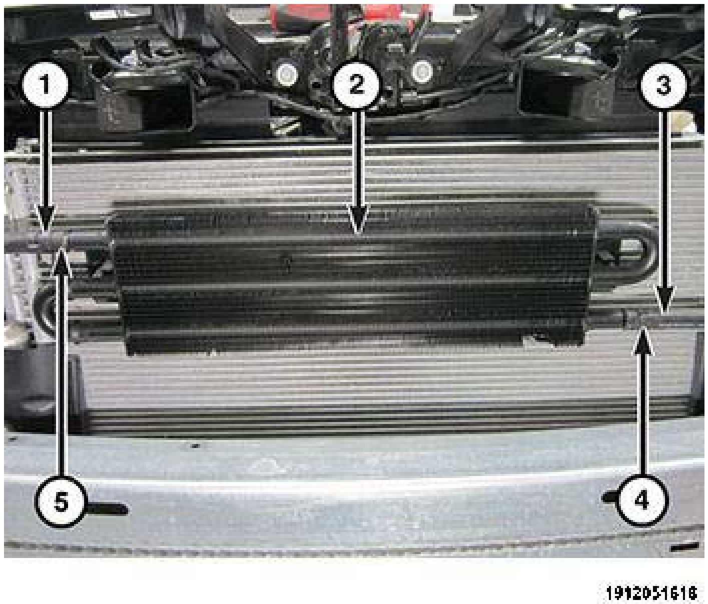

Fig. 69: Power Steering Fluid Cooler Components
Courtesy of CHRYSLER GROUP, LLC

1. Install the power steering return hose (3) to the cooling module (2) and tighten the clamp (4).

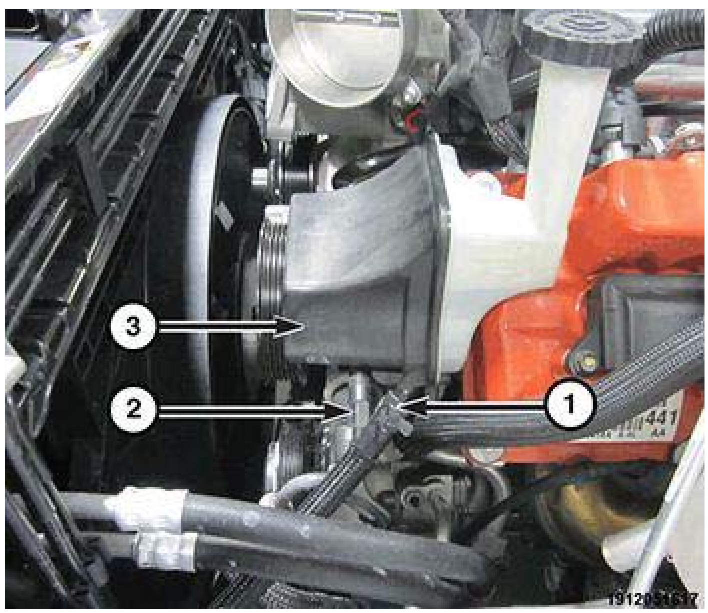

Fig. 70: Supply Hose, Pressure Hose & Power Steering Pump
Courtesy of CHRYSLER GROUP, LLC

2. Route hose through engine compartment.
3. Install the power steering return hose (1) onto reservoir (3) and tighten the clamp.
4. Install upper radiator closure panels.
5. Install the air cleaner. Refer to **BODY, AIR CLEANER, INSTALLATION, 6.2L** .
6. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.

7. Fill and bleed power steering system. Refer to **STANDARD PROCEDURE**.

GEAR TO COOLER - 6.2L

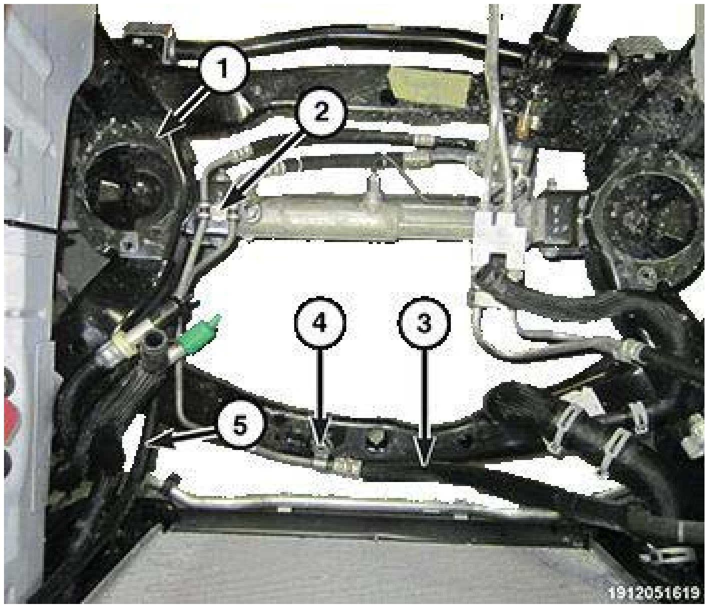

Fig. 71: Engine Cradle, Fasteners, Pressure Hose & Return Hose
Courtesy of CHRYSLER GROUP, LLC

1. Position the steering gear to cooler hose (5) in the vehicle.

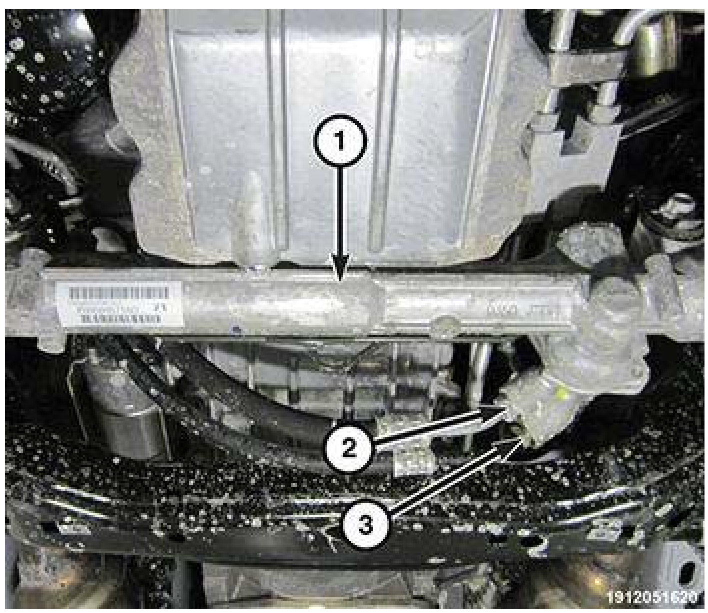

Fig. 72: Steering Gear, Pressure Hose & Return Hose
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Always use a**

NEW

O-ring on the end of the return hose at the steering gear.

2. Lubricate new O-ring on steering gear end of return hose with clean power steering fluid.
3. Lift gear end of return hose to return port on steering gear. Install return hose (2) to steering gear (1). **Do not tighten tube nut at this time.**

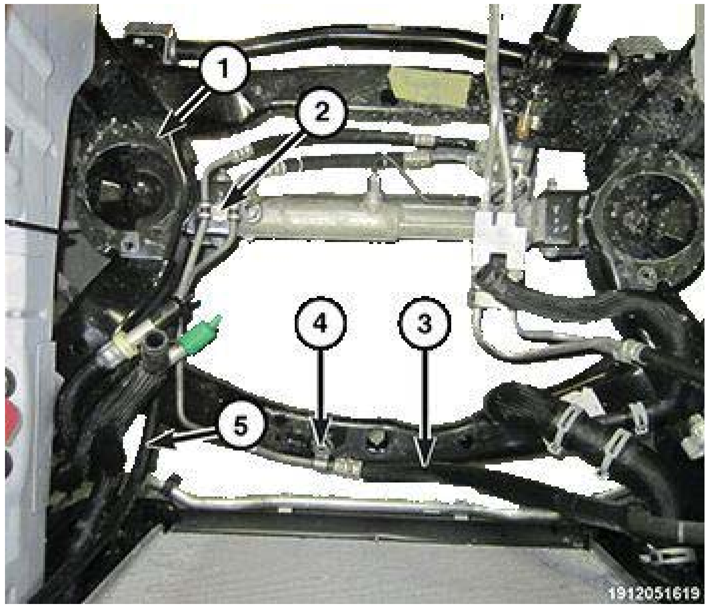

Fig. 73: Engine Cradle, Fasteners, Pressure Hose & Return Hose
Courtesy of CHRYSLER GROUP, LLC

4. Route return hose along right side of engine cradle as shown in illustration. Position pressure hose (3) routing clamp over return hose (5) routing clamp, then install screw (2) securing hoses to right side of engine cradle (1).

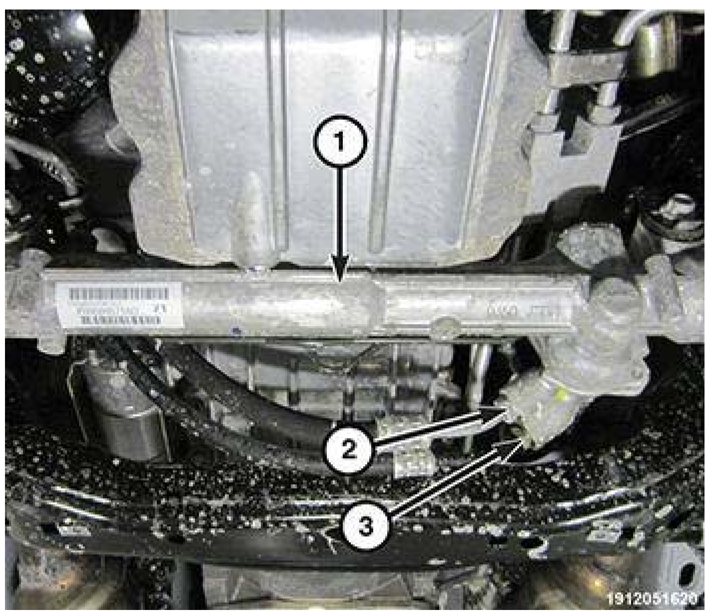

Fig. 74: Steering Gear, Pressure Hose & Return Hose
Courtesy of CHRYSLER GROUP, LLC

5. Tighten power steering return hose nut (2) at steering gear to the proper specification. Refer to **SPECIFICATIONS**.

6. Install belly pan. Refer to **BELLY PAN, INSTALLATION** and **BELLY PAN, ENGINE, INSTALLATION** .
7. Remove support and lower the vehicle.

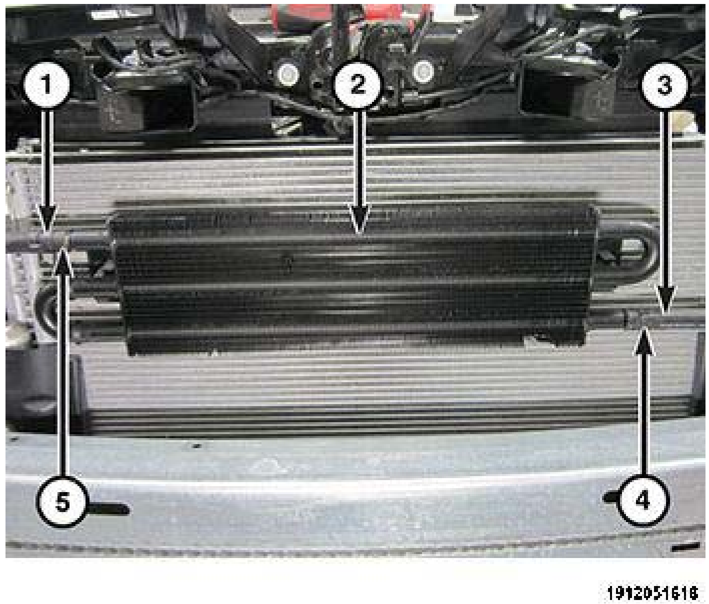

Fig. 75: Power Steering Fluid Cooler Components
Courtesy of CHRYSLER GROUP, LLC

8. Install the power steering hose (5) on the cooling module (2) and tighten the clamp (1).
9. Install radiator closeout panels.
10. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.
11. Fill and bleed power steering system. Refer to **STANDARD PROCEDURE**.

PULLEY, POWER STEERING PUMP

REMOVAL

6.2L

CAUTION: **Do not hammer on power steering pump pulley or shaft to remove power steering pump pulley. Damage to pulley and power steering pump will occur.**

CAUTION: **It is very important to use Puller, to remove pulley from power steering pump shaft. Use of other pullers can damage or break pulley and pump shaft.**

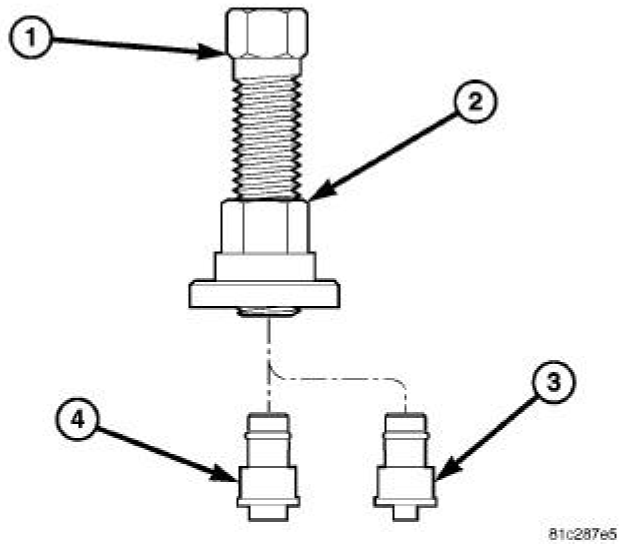

Fig. 76: Identifying Button Installation On Tool
Courtesy of CHRYSLER GROUP, LLC

1. Remove power steering pump from engine. Refer to **PUMP, REMOVAL**.
2. Coat Screw-Drive (1) with lubricant and thread into Puller Body (2).

NOTE: **Two Buttons come with Puller kit ((special tool #9962-3, Button, Thrust) and (special tool #9962-4, Button, Thrust)). Be sure to use Button that best fits end of pump shaft to avoid damage to Button or pump shaft.**

3. Insert Button (4) (special tool #9962-4, Button, Thrust), into end of Screw-Drive. Be sure not to misplace ball bearing that resides behind Button.

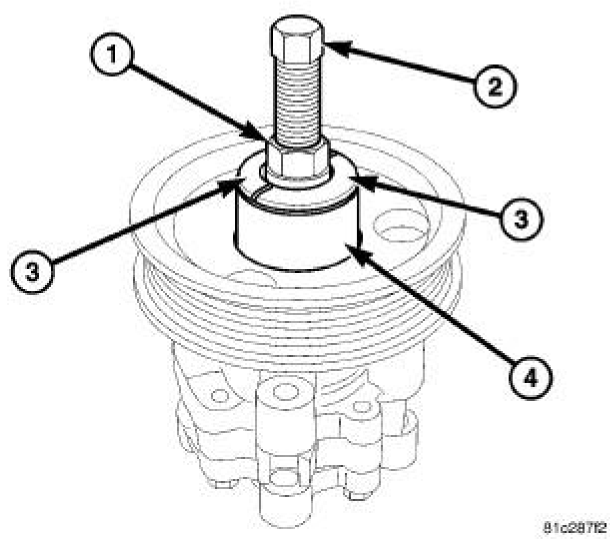

Fig. 77: View Of Tool 9962 Installed On Pulley
Courtesy of CHRYSLER GROUP, LLC

4. Assemble Puller (special tool #9962, Puller, P/S Pulley), over end of pump shaft and pulley hub.

a. Place Button on end of Screw-Drive against pump shaft.
b. Assemble Collets (3) (special tool #9962-2, Collet, Half, Pulley Remover), surrounding Puller Body (1) and pulley hub flange, then slide the Collet Sleeve over the Collets.
c. Hand tighten Screw-Drive (2) taking up any slack in Puller.

5. Hold Puller Body stationary while turning Screw-Drive until pulley is removed from power steering pump shaft.

NOTE: **Inspect pulley. Replace if pulley is bent, cracked, or loose.**

INSTALLATION

6.2L

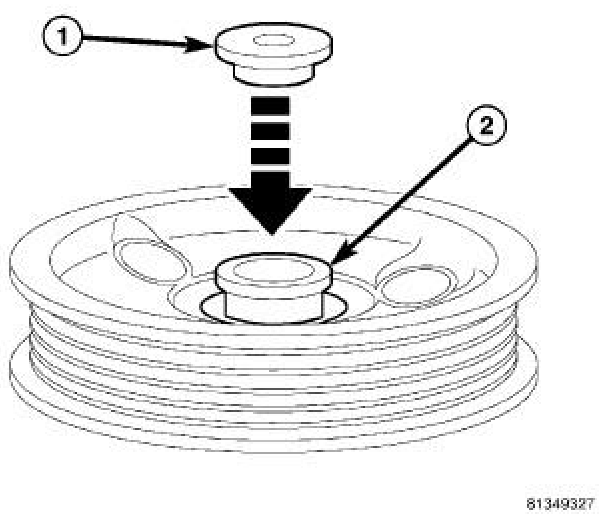

Fig. 78: Installing Spacer 6936 On Pulley
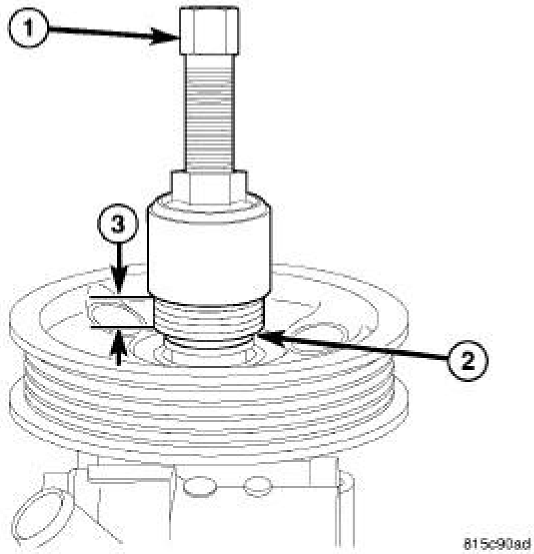
Courtesy of CHRYSLER GROUP, LLC

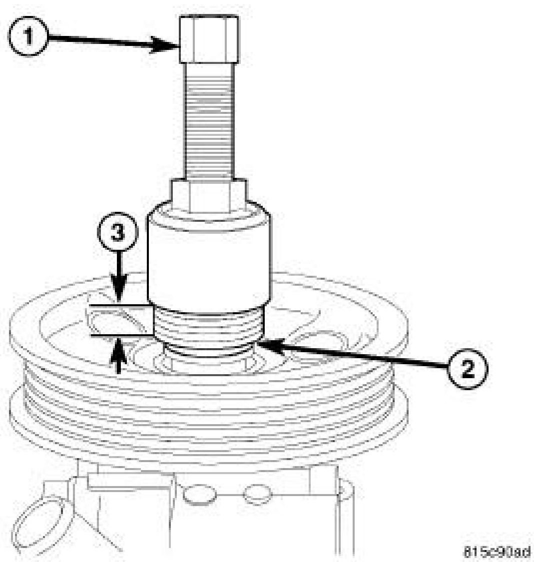
CAUTION: **Do not hammer on power steering pump pulley (2) or pump shaft to install pulley. This action will damage pulley and power steering pump.**

1. Place power steering pump pulley (2) squarely on end of power steering pump shaft.
2. Place Installation Spacer (1) (special tool #6936, Spacer), on top of pump pulley (2).



[Fig. 79: Install Pulley Using C-4063C, 6936 & Washers]
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Later build pumps feature a shaft with internal threads that are not as deep as earlier production, thus requiring a stack of washers, approximately 13 mm (0.512 in.) thickness (3), placed over Spacer (special tool #6936, Spacer) (2), before mounting Installer (special tool #C-4063C, Installer, P/S Pulley) (1) on the pump. To know if a replacement pump requires the stack of washers, measure the depth of the shaft hole. A later build pump will have a depth of 20 mm (0.787 in.) while an earlier build pump will have a depth of 32 mm (1.25 in.).**



[Fig. 80: Install Pulley Using C-4063C, 6936 & Washers]
Courtesy of CHRYSLER GROUP, LLC

3. As necessary (see above note), place a stack of washers approximately 13 mm (0.512 in.) thickness (3) over Spacer (special tool #6936, Spacer) (2).

NOTE: **Installer (special tool #C-4063C, Installer, P/S Pulley), is a combination of Installer (special tool #C-4063C, Installer, P/S Pulley), and Forcing Screw (special tool #C-4063-2, Forcing Screw). It is important to use Forcing Screw (special tool #C-4063-2, Forcing Screw) when performing this procedure.**

4. Thread Installer (1) (special tool #C-4063C, Installer, P/S Pulley), completely into internal threads of power steering pump shaft, then rotate Installer Nut down against washers (as necessary) and Spacer (2) on pump pulley.
5. Ensuring that special tools and pulley remain aligned with pump shaft, tighten Installer Nut, forcing pulley onto power steering pump shaft until Spacer (2) comes in contact with end of pump shaft. **When Spacer (2) is against shaft of power steering pump, Installer (1) Nut will no longer rotate.**
6. Install power steering pump. Refer to PUMP, INSTALLATION.

RESERVOIR, POWER STEERING PUMP

REMOVAL

SRT

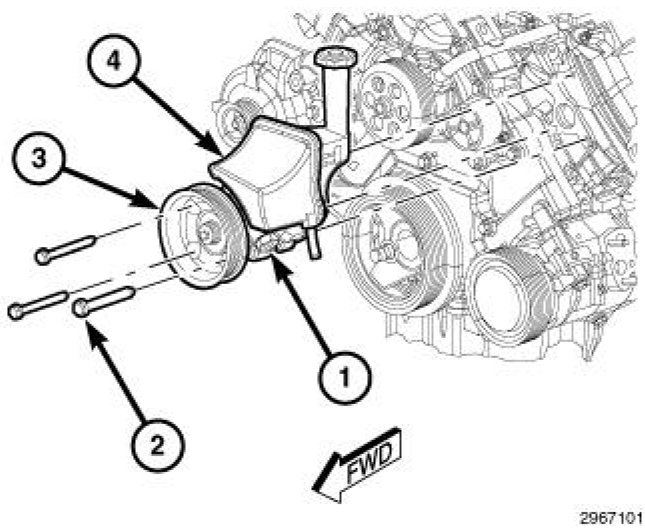


Fig. 81: Power Steering Reservoir, Pump, Pulley & Bolts
Courtesy of CHRYSLER GROUP, LLC

For the hydraulic Power Steering System, the power steering reservoir (4) is integrated with the power steering pump (1) Refer to PUMP, REMOVAL.

INSTALLATION

SRT

2015-16 ACCESSORIES AND EQUIPMENT

Power Top/Sunroof - Service Information - Challenger

DESCRIPTION

DESCRIPTION

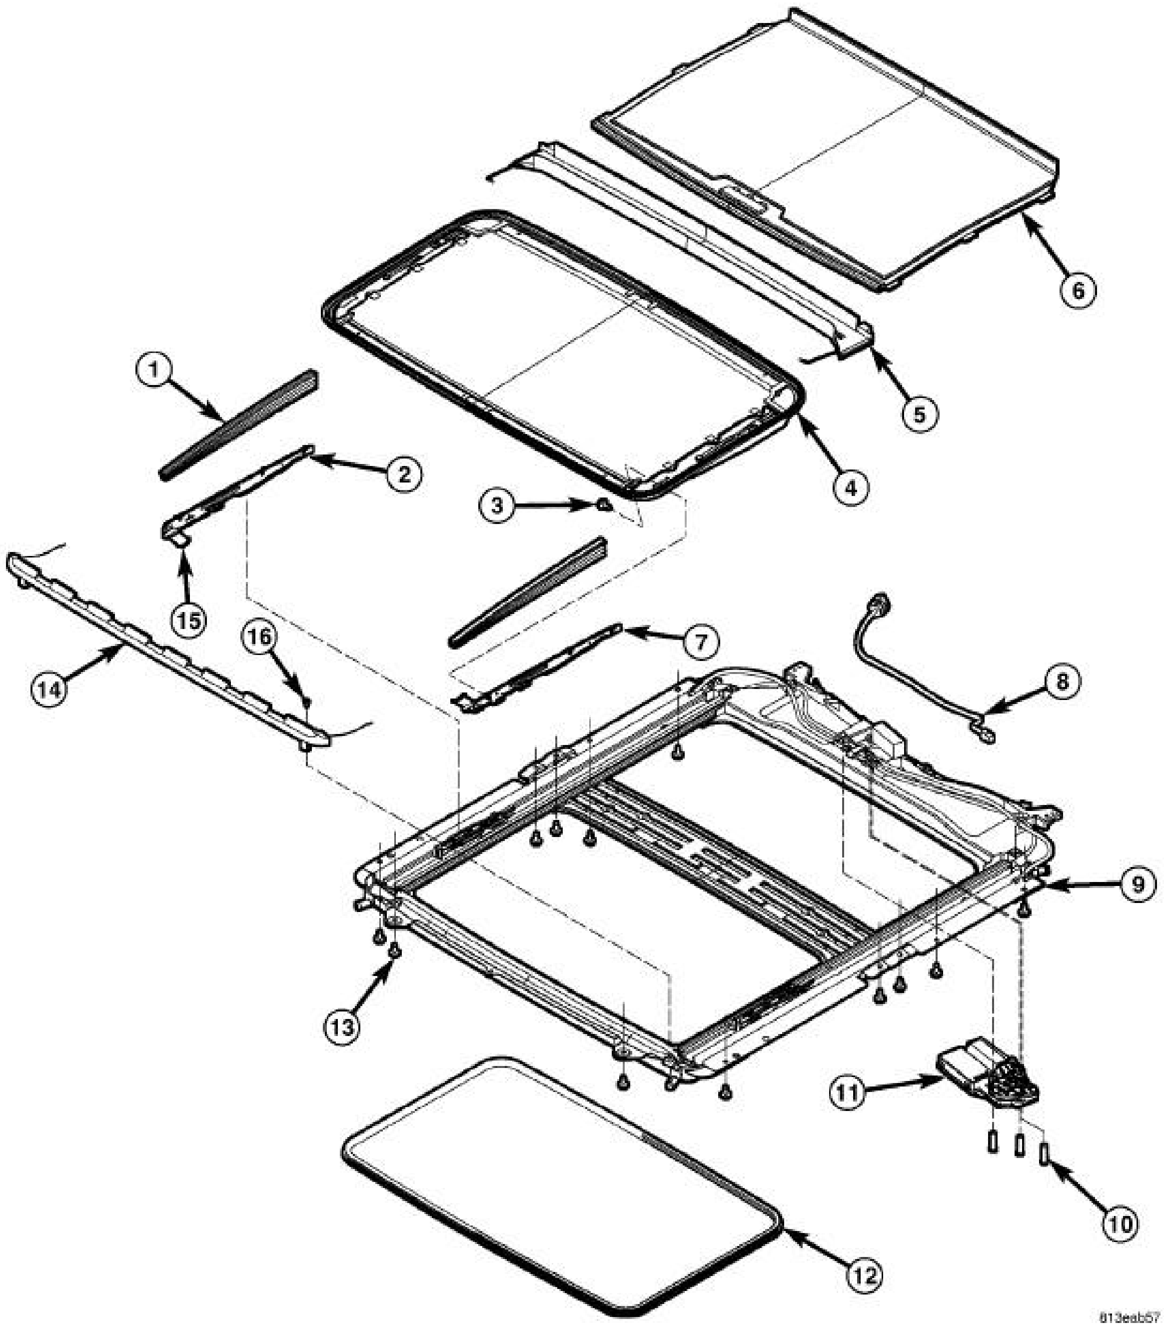

Fig. 1: Exploded View Of Sunroof
Courtesy of CHRYSLER GROUP, LLC

The power sunroof system allows the sunroof to be opened, closed or placed in the vent position electrically by actuating a switch in the overhead console. The sunroof system receives battery feed through a fuse in the

Power Distribution Center (PDC). The sunroof will operate normally with the ignition state in any position while the Accessory Delay system is active.

The sunroof glass panel tilts upward at the rear for ventilation and slides rearward under the roof when open. The panel seals flush with the roof in the closed position to eliminate wind noise. The sunroof includes a manual-sliding sunshade to cover the deep-tinted glass panel.

In addition to the standard power sunroof operation, this vehicle offers several additional features. There is an express (one-touch) opening and closing feature as well as Excessive Force Limitation (EFL). The EFL function detects obstacles trapped between the glass and the vehicle roof during a closing motion. Upon sensing an obstacle the EFL function will reverse direction of the glass to allow removal of the obstacle.

The main components of the power sunroof system are:

- The motor/module assembly
- The power sunroof glass and frame assembly
- The power sunroof switch
- The manual-sliding sunshade

OPERATION

OPERATION

This vehicle has a vent, tilt and slide power sunroof system with express (one-touch) open and closing feature. The sunroof system receives constant battery feed through a fuse in the Power Distribution Center (PDC). If the sunroof is moving when the key is turned to the START position (crank engine), all motion stops. New switch press is needed to start motion. The sunroof will stop a requested motion if the Accessory Delay system goes inactive while the motion is in progress.

A combination push-button and rocker switch module mounted in the overhead console controls sunroof operation. The sunroof switch is a rocker design with a push button in the center of the two halves of the rocker. Pressing the rocker towards the front of the car commands the sunroof closed. Pressing the rocker towards the rear of the car commands the sunroof open. Pressing the center push button commands the sunroof up into the vent position (Rear of sunroof glass raises above the vehicle roof with glass still covering the sunroof opening). All switch commands operate with the glass starting in any position. For additional information, refer to **SWITCH, SUNROOF, OPERATION**.

An electronic control system, integral to the motor/module assembly, provides the express and manual modes of operation for the open, close and vent functions. Manual operation is activated when by pressing and holding the open, close or vent rocker switch. In manual mode operation the glass will stop operation as soon as the switch is released or when the full closed or full open position is reached. Express operation is activated by pressing and releasing the "open" or "close" rocker switch within one half second. In express operation the glass will automatically open/close to the full open, vent open or closed position and automatically stop. During express closing, anytime an obstacle is detected in the way of the glass, the motor will stop and reverse travel to avoid pinching an occupant's finger, ice in the track, etc. This function is called Excessive Force Limitation (EFL). When three EFL events occur without the glass being allowed to fully close, the next close attempt will only move while the close switch is continuously actuated. This allows the sunroof to be forced closed if multiple close attempts fail. While in EFL override, the closing motion will cease if the sunroof switch is

released at any time.

The sunroof is calibrated to stop the glass in the correct open, close and vent positions. If the sunroof becomes uncalibrated, it will only respond to the vent switch. If the vent switch is pressed, the glass will move toward vent; if the switch is released, all motion stops. In the event that the sunroof system becomes uncalibrated perform the sunroof position calibration procedure. Refer to **MOTOR, SUNROOF, STANDARD PROCEDURE**.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SUNROOF SYSTEM

The hard wired circuits between components related to the operation of the single pane power sunroof system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic module integral to the power sunroof motor. If the power sunroof switches, motors and circuitry test okay, but the express or Excess Force Limitation (EFL) features are still ineffective following the calibration and initialization procedures, the motor and module unit must be replaced.

NOTE: **If there is no sliding sunroof panel movement when the power sunroof switch OPEN or CLOSE push button is depressed, but there is movement when the VENT push button is depressed, the sunroof module requires calibration. Complete the Single Pane Sunroof Motor And Module Initialization procedure prior to performing any further sunroof diagnosis. Refer to** **MOTOR, SUNROOF, STANDARD PROCEDURE****.**

CONDITION	POSSIBLE CAUSES	CORRECTION
POWER SUNROOF COMPLETELY INOPERATIVE	1. Ineffective ground circuit.	1. Test and repair the open sunroof motor ground circuit if required.
	2. Ineffective feed circuit.	2. Test and repair the open sunroof motor feed circuit if required.
	3. Ineffective sunroof switch.	3. Test and replace the sunroof switch (overhead console assembly) if required.
	4. Ineffective sunroof motor and module unit.	4. Replace the sunroof motor and module unit if required.
AUDIBLE WHINE WHEN POWER SUNROOF SWITCH IS ACTUATED	1. Binding drive cable.	1. Replace the binding drive cable if required.
	2. Ineffective sunroof motor and module unit.	2. Replace the sunroof motor and module unit if required.
AUDIBLE CLICKING OR RATCHETING WHEN POWER SUNROOF SWITCH IS	1. Improperly adjusted sliding glass panel.	1. Adjust the sunroof glass panel if required. Refer to **GLASS, SUNROOF, ADJUSTMENTS** .

CONDITION	POSSIBLE CAUSES	CORRECTION
ACTUATED	2. Damaged or worn drive cable.	2. Replace the broken or worn drive cable if required.
	3. Damaged or worn motor drive gear.	3. Replace the sunroof motor and module unit if required.
POWER SUNROOF VENTS AND OPENS BUT DOES NOT CLOSE	1. Damaged or disengaged trough guide.	1. Replace or reinstall trough guide if required.
	2. Binding drive cable.	2. Replace the binding drive cable if required.
	3. Ineffective CLOSE circuit.	3. Repair the sunroof CLOSE circuit between the switch and the motor if required.
	4. Ineffective sunroof switch.	4. Test and replace the sunroof switch (overhead console assembly) if required.
	5. Ineffective sunroof motor and module unit.	5. Replace the sunroof motor and module unit if required.
POWER SUNROOF VENTS AND CLOSES BUT DOES NOT OPEN	1. Binding drive cable.	1. Replace the binding drive cable if required.
	2. Ineffective OPEN circuit.	2. Repair the sunroof OPEN circuit between the switch and the motor if required.
	3. Ineffective sunroof switch.	3. Test and replace the sunroof switch (overhead console assembly) if required.
	4. Ineffective sunroof motor and module unit.	4. Replace the sunroof motor and module unit if required.
POWER SUNROOF DOES NOT VENT	1. Binding drive cable.	1. Replace the binding drive cable if required.
	2. Ineffective VENT circuit.	2. Repair the sunroof VENT circuit between the switch and the motor if required.
	3. Ineffective sunroof switch.	3. Test and replace the sunroof switch (overhead console assembly) if required.
	4. Ineffective sunroof motor and module unit.	4. Replace the sunroof motor and module unit if required.
POWER SUNROOF GLASS MOVEMENT INCONSISTENT - NOT SMOOTH AND UNIFORM	1. Improperly adjusted sliding glass panel.	1. Adjust the sunroof glass panel if required. Refer to **GLASS, SUNROOF, ADJUSTMENTS** .

MOTOR, SUNROOF

DESCRIPTION

DESCRIPTION

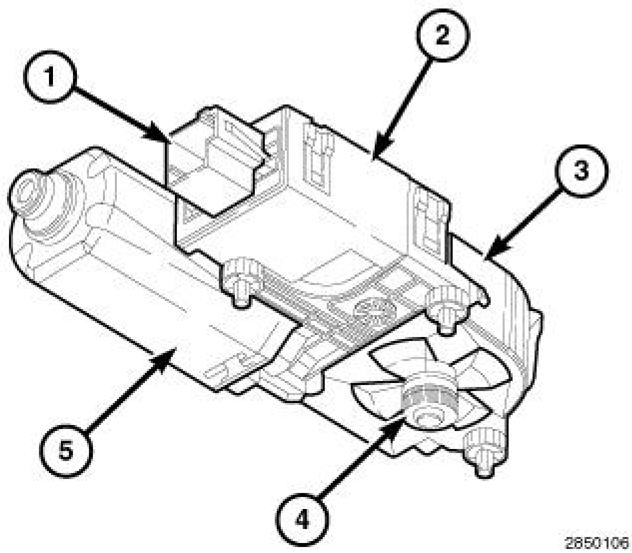

Fig. 2: Single Pane Sunroof Motor Assembly
Courtesy of CHRYSLER GROUP, LLC

The single pane sunroof has a single motor (5) and electronic module unit (2) secured by three screws near the center of the underside of the rear sunroof frame member where it is concealed above the headliner. The motor is a reversible, 12-volt Direct Current (DC) permanent magnet motor with internal thermal protection. The motor is connected mechanically to the sunroof drive gear (4) through a right angle drive and gear reduction transmission (3). The motor also is connected electrically to the on-board electronic control unit that includes an integral connector receptacle (1) that connects the unit to the vehicle electrical system through a dedicated take out and connector of the sunroof wire harness.

The sunroof motor and electronic module units cannot be repaired. If ineffective or damaged, the entire motor and module unit must be replaced.

OPERATION

OPERATION

The single pane power sunroof motor is completely controlled by the circuitry of the on-board electronic module. The module receives battery current on a fused B(+) circuit from the Body Control Module (BCM) and has a path to ground at all times through a take out and eyelet terminal connector secured by a ground screw to the body sheet metal. These connections allow the module to function regardless of the ignition switch position.

However, the module also monitors an input on a fused ignition switch output (run - accessory) circuit, and provides a source current to the sunroof switches in the overhead console only when the ignition switch is in the ON or ACCESSORY positions, or while the accessory delay feature is active. The module then monitors a separate input circuit for each switch position, which it uses to determine the proper outputs to the power sunroof motor. A positive and negative battery connection to the two motor brushes will cause the power sunroof motor to rotate in one direction. Reversing the current through these same two brushes will cause the motor to rotate in the opposite direction.

The hard wired circuits of the power sunroof motor as well as those between the electronic module and the switch in the overhead console may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic module integral to the power sunroof motor. If the power sunroof switch and the hard

wired circuitry test okay, but the motor or the express or Excess Force Limitation (EFL) features are still ineffective following the calibration and initialization procedures, the motor and module must be replaced as a unit.

STANDARD PROCEDURE

EXCESSIVE FORCE LIMITATION (EFL) CALIBRATION

NOTE: **Verify the battery is in good condition prior to performing this procedure. Do not leave the vehicle on a battery charger while performing this procedure. If the voltage at the sunroof motor/module drops below 11 volts or exceeds 15 volts at anytime while this procedure is being performed, the Excessive Force Limitation (EFL) function will not be properly calibrated.**

1. Depress the VENT push button of the sunroof switch so that the sliding glass panel travels to the fully vented position.
2. Depress the CLOSE push button of the sunroof switch so that the sliding glass panel travels to the fully closed position.
3. Depress the OPEN push button of the sunroof switch so that the sliding glass panel travels to the fully open position.
4. Depress the CLOSE push button of the sunroof switch so that the sliding glass panel travels to the fully closed position.
5. Repeat steps 2 through 5 for at least 5 complete sliding glass panel cycles (VENT, CLOSE, OPEN, CLOSE).

EXCESSIVE FORCE LIMITATION (EFL) OVERRIDE

There are two methods for overriding the obstacle detection feature if the single pane sunroof sliding glass is unable to close due to a known blockage conditions (ice, leaves, debris in the track).

- **OVERRIDE - METHOD 1** - Depress and hold the CLOSE push button of the sunroof switch during the close. The sunroof will be in override mode during the close.
- **OVERRIDE - METHOD 2** - Once the sunroof encounters and reverse on an obstacle during express (one touch) closing three consecutive times, the sunroof will be in override mode. All push button commands will be in manual mode (no one-touch or express mode) while the obstacle detection feature is in override mode.

EXITING OVERRIDE MODE - Any sunroof obstacle detection override mode is exited by reaching the close position. Once the override has been existed, all normal operation will resume including the obstacle detection feature.

SUNROOF POSITION CALIBRATION

Press the power sunroof switch (Open, Closed, and Vent). If no movement occurs when either the open switch or closed switch is pressed, but the system does move when the vent button is pressed and held, the system is not calibrated. Perform the following procedure to position calibrate the power sunroof system.

1. Turn the ignition to the RUN position.
2. Press the vent button on the power sunroof switch and hold until the sunroof glass panel has moved to the

full vent position and the motor movement has stopped for at least 1 second.

3. Press the close switch on the power sunroof switch and hold for a moment (at least 100ms) and release. The sunroof glass panel should continue travel to the full close position. If the sunroof glass panel does not return to the full close position, refer to the appropriate diagnostic information for full system diagnosis.
4. Verify proper system operation.

SUNROOF OVERRIDE POSITION CALIBRATION

The sliding glass panel motor stalls when the glass reaches the fully vented position and the electronic motor module learns that position (hard stop), then counts the number of motor rotation to know where the fully closed and fully open positions of the glass are located. The following procedure causes a previously calibrated and properly operating electronic motor module to relearn the fully vented motor stall position. This routine should be performed after the sunroof position calibration procedure has been performed.

1. Be certain the electrical system voltage is at or above 12.5 volts.
2. Be certain that ignition switch is in the ON position.
3. Be certain the power sunshade is open at least beyond the back of the sliding glass panel opening.
4. Depress and hold the VENT push button of the sunroof switch until the sliding glass panel is in the fully vented position or until the motor will not drive the glass any further towards the fully vented position.
5. Open the drivers side front door.
6. Turn the ignition to the OFF position.
7. Within 2 seconds, turn the ignition back to the ON position.
8. Within 2 seconds, depress and hold the vent push button on the sunroof switch for about ten seconds. At the end of ten seconds, the motor will try to drive the sliding glass panel to the fully vented position. Once the motor stall is detected the electronic module will write that stall position to memory as the new glass position.
9. Verify sliding glass panel motor operation by cycling the glass to fully opened, fully closed, fully vented, then fully closed again.

REMOVAL

REMOVAL

WARNING: Do not attempt to move or reposition the sunroof glass panel or drive cables with the sunroof motor and module unit removed. Damage to the vehicle, to the sunroof or personal injuries may result.

WARNING: The Sunroof Motor And Module Initialization procedure must be completed any time a sunroof motor and module unit is replaced with a new component. Failure to perform this procedure may result in damage to the vehicle, to the sunroof or in serious or fatal injuries.

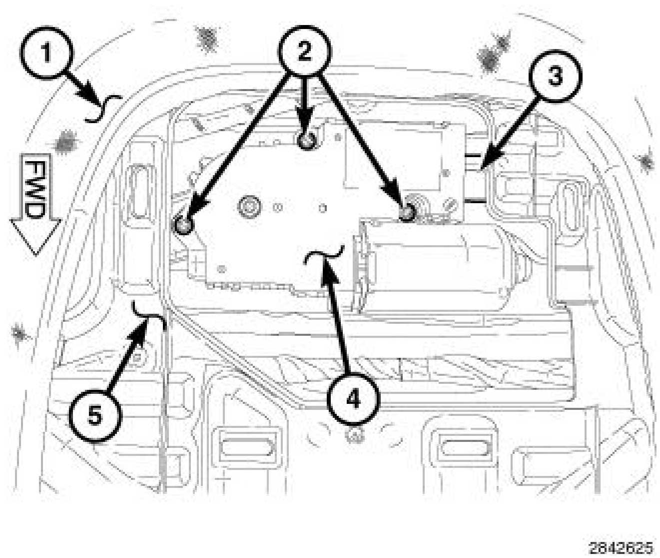

Fig. 3: Headliner, Bracket, Module Unit, Screws & Module Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Lower the back of the headliner (1) to gain access to the module unit (4). Refer to **HEADLINER, REMOVAL** .
3. Remove the three screws (2) that secure the motor and module to the sunroof frame.
4. Lower the motor and module unit far enough to access and disconnect the sunroof wire harness connector from the motor and module connector receptacle (3).
5. Remove the sunroof motor and module unit from the vehicle.

INSTALLATION

INSTALLATION

WARNING: Do not attempt to move or reposition the sunroof glass panel or drive cables with the sunroof motor and module unit removed. Damage to the vehicle, to the sunroof or personal injuries may result.

WARNING: The Sunroof Motor And Module Initialization procedure must be completed any time a sunroof motor and module unit is replaced with a new component. Failure to perform this procedure may result in damage to the vehicle, to the sunroof or in serious or fatal injuries.

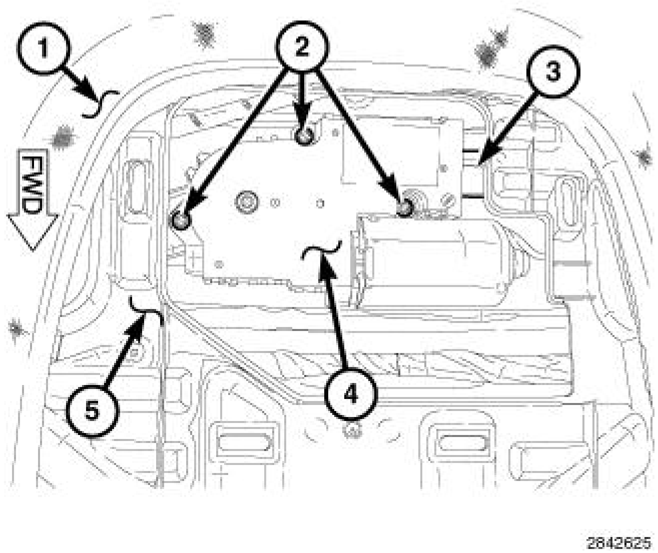

Fig. 4: Headliner, Bracket, Module Unit, Screws & Module Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

1. Position the sunroof motor and module unit (4) close enough to connect the wire harness connector to the motor and module connector receptacle (3).
2. Position the motor and module onto the sunroof frame.
3. Install and tighten the three screws (2) that secure the motor and module to the sunroof frame.
4. Install the rear of the headliner. Refer to **HEADLINER, INSTALLATION** .
5. Reconnect the battery negative cable.
6. Perform the Sunroof Position Calibration procedure followed by the Excessive Force Limitation (EFL) Calibration procedure. Refer to **MODULE, POWER SUNROOF, MODULE PROGRAMMING** .

SWITCH, SUNROOF

DESCRIPTION

DESCRIPTION

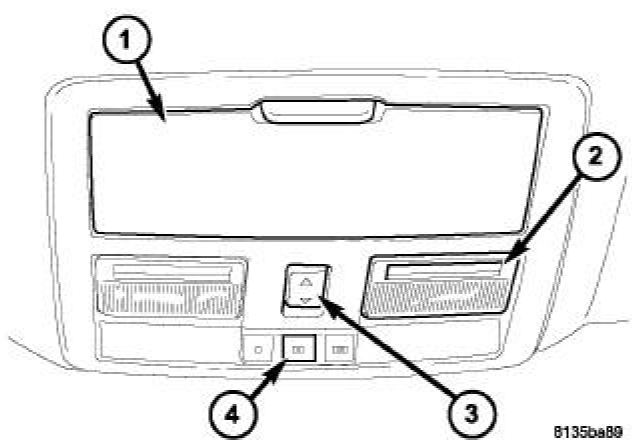

Fig. 5: Overhead Console Components

Courtesy of CHRYSLER GROUP, LLC

The power sunroof switch (3) is a combination push-button and rocker switch module mounted in the overhead console. The sunroof switch is a direct contact unit that is directly wired to the sunroof motor/module assembly. The sunroof switch performs the following functions:

- Power sunroof open (back of switch pushed)
- Power sunroof closed (front of switch pushed)
- Power sunroof vent (switch center button pushed)

The power sunroof switch is part of the overhead console assembly and cannot be replaced separately. If the switch is damaged or inoperative the overhead console unit must be replaced. Refer to **CONSOLE, OVERHEAD, FRONT, REMOVAL** .

OPERATION

OPERATION

The single pane power sunroof motor is completely controlled by the circuitry of the on-board electronic module. The module receives battery current on a fused B(+) circuit from the Body Control Module (BCM) and has a path to ground at all times through a take out and eyelet terminal connector secured by a ground screw to the body sheet metal. These connections allow the module to function regardless of the ignition switch position.

However, the module also monitors an input on a fused ignition switch output (run - accessory) circuit, and provides a source current to the sunroof switches in the overhead console only when the ignition switch is in the ON or ACCESSORY positions, or while the accessory delay feature is active. The module then monitors a separate input circuit for each switch position, which it uses to determine the proper outputs to the power sunroof motor. A positive and negative battery connection to the two motor brushes will cause the power sunroof motor to rotate in one direction. Reversing the current through these same two brushes will cause the motor to rotate in the opposite direction.

The hard wired circuits of the power sunroof motor as well as those between the electronic module and the switch in the overhead console may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic module integral to the power sunroof motor. If the power sunroof switch and the hard wired circuitry test okay, but the motor or the express or Excess Force Limitation (EFL) features are still ineffective following the calibration and initialization procedures, the motor and module must be replaced as a unit.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SUNROOF SWITCH

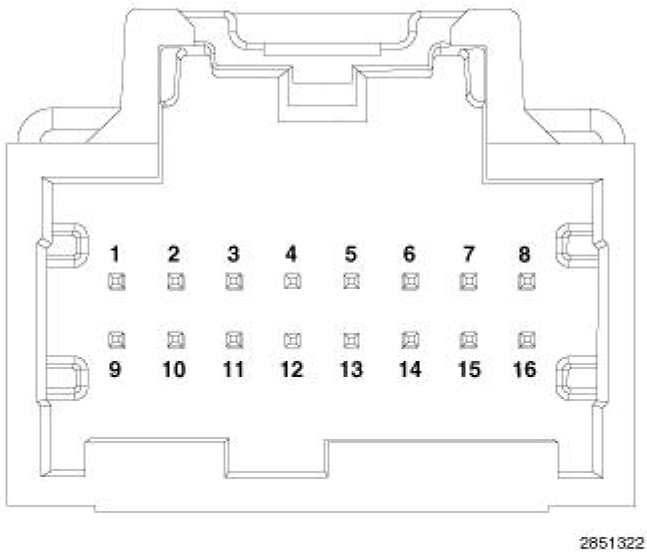

Fig. 6: Sunroof Switch Connector Terminal Identification
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the overhead console from the headliner. Refer to **CONSOLE, OVERHEAD, FRONT, REMOVAL** .
3. Disconnect the overhead wire harness connector from the overhead console connector receptacle.
4. Using a multimeter, test the continuity between the terminals of the overhead console connector receptacle while actuating the power sunroof switch or power sunshade switch as shown in the Sunroof Switch Tests or Sunshade Switch Tests table.

SUNROOF SWITCH TESTS	
SWITCH POSITION	CONTINUITY BETWEEN PINS
OFF	NO CONTINUITY
OPEN	9 and 12
CLOSE	11 and 12
VENT	10 and 12

SUNSHADE SWITCH TESTS	
SWITCH POSITION	CONTINUITY BETWEEN PINS
OFF	NO CONTINUITY
OPEN	12 and 14
CLOSE	12 and 13

5. If either switch fails any of the tests, replace the overhead console and both switches as a unit as required.

2015-16 ACCESSORIES AND EQUIPMENT

Navigation/Telecommunication - Service Information - Challenger

DESCRIPTION

HANDS FREE PHONE

A Uconnect™ Hands Free Phone system is factory-installed optional equipment. This system allows hands free use of compatible mobile phones for sending and receiving phone calls and text messages as well as for streaming audio from those devices through the audio system in the vehicle. The Hands Free Phone system includes the following major components, which are described in further detail elsewhere in this service information:

- **Bluetooth™ Antenna** - A Bluetooth™ antenna is internal and integral to the Radio Receiver Module (RRM) (also known as the radio or the head unit).
- **Bluetooth™ Phone** - A compatible, customer-supplied and paired Bluetooth™ phone is a required component of the hands free phone system. A list of suggested phones and providers is available at: **http://www.chrysler.com/uconnect**
- **Body Control Module** - The Body Control Module (BCM) (also known as the Common Body Controller/CBC) is located on the right cowl side inner panel within the passenger compartment, where it is concealed behind the cowl side kick panel to the right of the instrument panel. The BCM is the configuration master node for the vehicle. Refer to **MODULE, BODY CONTROL, DESCRIPTION** .
- **Electronic Vehicle Information Center Switch Pod** - The Electronic Vehicle Information Center (EVIC) switch pod is located in the left horizontal spoke of the steering wheel. In addition to the EVIC switch buttons this switch pod contains the Uconnect™ Voice Recognition (VR) (also known as Voice Command) switch button and the Uconnect™ Phone switch button of the Hands Free Phone system. Refer to **SWITCH, EVIC CONTROL, DESCRIPTION** .
- **Microphones** - Stereo microphones are integral to the inside rear view mirror in vehicles equipped with the Uconnect™ Hands Free Phone system. These microphones are located on the top surface of the mirror housing, one to each side of center. Refer to **MICROPHONE, DESCRIPTION**.
- **Radio Receiver Module** - The Radio Receiver Module (RRM) (also known as the radio or the head unit) is located near the top of the instrument panel center stack area and is the primary component of the phone system in this vehicle. In addition to a 213 millimeter (8.4 inch) color electronic touchscreen display, a microcontroller, a Bluetooth™ transceiver, a navigation module, flash memory and sophisticated Advanced Speech Recognition (ASR) input capability through Voice Recognition (VR) software. The ASR software includes many different available languages. Each vehicle is equipped with a list of available languages, which are made available from the factory based upon languages most commonly used for the market destination. Refer to **RADIO, DESCRIPTION** .

The RRM also contains a microcontroller and programming that allows it to communicate with other electronic modules in the vehicle over the Controller Area Network - Interior High Speed (CAN-IHS) data bus. Refer to **COMMUNICATION, DESCRIPTION** .

The Uconnect™ Hands Free Phone system components cannot be adjusted or repaired. If any Hands Free Phone system component is damaged or ineffective, that component must be replaced. The Hands Free Phone system software is flash programmable through the Universal Serial Bus (USB) port.

NAVIGATION

A factory-installed satellite navigation system based upon the Global Positioning System (GPS) is an available option on this vehicle. Depending upon the optional touchscreen Radio Receiver Module (RRM) (also known as the radio or the head unit) selected for the vehicle, there are some variations in navigation system features available. Each system provides the vehicle operator with both visual and audible guidance to a chosen destination. An available premium navigation system includes such features as one-shot Voice Recognition (VR) destination entry, three dimensional city models and landmarks, digital terrain modeling, SiriusXM™ Travel Link and SiriusXM™ Traffic.

A RRM color touchscreen electronic display provides a graphical interface for programming, searching for and selecting destinations. In vehicles also equipped with a Uconnect™ Hands-Free telecommunication option, the available navigation systems are also equipped with Advanced Speech Recognition (ASR) input capability allowing hands-free operation. Each system provides visual guidance through dynamic maps with a turn-by-turn feature that can be enabled or disabled by the vehicle operator, while voice prompts through the audio system of the vehicle provide the vehicle operator with audible alerts and directions coordinated with the visual displays. The system also displays and logs valuable trip information such as speed, posted speed limit, distance and Estimated Time of Arrival (ETA).

The premium navigation system is activated when the vehicle is shipped from the factory, while another available system is shipped from the factory as Navigation Ready. The Navigation Ready system allows the customer to choose whether to have the dealer activate the embedded navigation module after the vehicle has been delivered.

The navigation system includes the following major components, which are described in further detail elsewhere in this service information:

- **Body Control Module** - The Body Control Module (BCM) (also known as the Common Body Controller/CBC) is located on the right cowl side inner panel within the passenger compartment, where it is concealed behind the cowl side kick panel to the right of the instrument panel. The BCM is the configuration master node for the vehicle. Refer to **MODULE, BODY CONTROL, DESCRIPTION** .
- **Combination Antenna** - The navigation module acquires GPS position data through a roof-mounted combination antenna that also receives satellite audio and cellular signals. Refer to **ANTENNA, SATELLITE, DESCRIPTION** .
- **Electronic Vehicle Information Center** - The Electronic Vehicle Information Center (EVIC) is an electronic display within the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC). When Turn-By-Turn navigation is enabled through the EVIC Personal Settings menu, the EVIC displays turn-by-turn directions to the chosen destination supplemental to the navigation display within the RRM touchscreen unit. Refer to **CENTER, ELECTRONIC VEHICLE INFORMATION, DESCRIPTION** .
- **Electronic Vehicle Information Center Switch Pod** - The Electronic Vehicle Information Center (EVIC) switch pod is located in the left horizontal spoke of the steering wheel. In addition to the EVIC switch buttons this switch pod contains the Uconnect™ Voice Recognition (VR) (also known as Voice Command) switch button and the Uconnect™ Phone switch button of the Uconnect™ Hands-Free Phone system. Refer to **SWITCH, EVIC CONTROL, DESCRIPTION** .
- **Microphones** - Stereo microphones are integral to the inside rear view mirror in vehicles equipped with the Uconnect™ Hands-Free Phone system. These microphones are located on the top surface of the mirror housing, one to each side of center. Refer to **MICROPHONE, DESCRIPTION**.

- **Radio Receiver Module** - The Radio Receiver Module (RRM) (also known as the radio or the head unit) contains the central components of the navigation system. In addition to a 213 millimeter (8.4 inch) color electronic touchscreen display, a navigation module is internal and integral to each RRM that is equipped with navigation capability. The navigation module contains all of the navigation system hardware and software. Hardware includes the GPS receiver, an electronic gyroscope, a microcontroller and flash memory for system software and map data storage. Refer to **RADIO, DESCRIPTION** .

The IC and the RRM each contain a microcontroller and programming that allow them to communicate with each other and other electronic modules in the vehicle using the Controller Area Network - Interior High Speed (CAN - IHS) data bus. Refer to **COMMUNICATION, DESCRIPTION** .

The navigation system components cannot be adjusted or repaired. If any of the navigation system components is damaged or ineffective, that component must be replaced. The external combination antenna can be repaired separately from the RRM. The navigation system software as well as the map data is flash programmable through the Universal Serial Bus (USB) port.

UCONNECT ACCESS

A Uconnect™ Access system is factory-installed optional equipment that uses an embedded cellular module within the Radio Receiver Module (RRM) (also known as the radio or the head unit) to enable several mobile connectivity features. Vehicles equipped with the Uconnect™ Access system can be readily identified by two switch buttons on the inside rear view mirror identified with **ASSIST** and **9-1-1** labels.

To enable Uconnect™ Access, a subscription must be completed by the customer. Detailed directions for subscription along with other information relating to Uconnect™ Access can be found on **www.driveuconnect.com** or within the Uconnect™ owner manual supplement for the supported radios.

NOTE: **A free trial period of Uconnect™ Access may be offered with the sale of a new vehicle. Registration will be required to activate the trial subscription.**

Subscription to Uconnect™ Access provides many features that allow cellular smart phones to be put away in favor of the integrated mobile connectivity features and functionality accessible through the use of the radio, steering wheel and voice controls in the vehicle. All Access features are only available based on subscription. Features are continually being added or changed and offerings at the time this information was last updated included:

- **9-1-1/Assist** - The following call features are executed through the embedded cellular module of the RRM:
  - **9-1-1** - Pressing the **9-1-1** button will initiate an emergency call to a Public Safety Answering Point (PSAP). The Global Positioning System (GPS) coordinates of the vehicle are made available to the emergency operator in the event help needs to be sent. In addition it opens a two way voice channel with the emergency operator allowing communication between the vehicle occupant and the emergency operator.
  - **Assist** - Pressing the **ASSIST** button will present the customer with three choices. Uconnect™ Care, Vehicle Care or Roadside Assistance. These selection options are presented as soft keys in the RRM display. Selecting any one of these choices will place a call to the selected group. If there are questions about Uconnect™ Services, Uconnect™ Care can be contacted; if there are questions related to vehicle functionality, Vehicle Care can be contacted; or, if Roadside Assistance is needed,

a direct call can be made.

- **Applications** - Some of the Uconnect™ Access applications (apps) presently available include:
  - **SRT Performance Pages** - The SRT Performance Pages app (for SRT models only) gives SRT vehicle owners access to the performance data for their vehicle. This app provides access to real-time vehicle performance information including timers (such as 0 to 60 mph elapsed time), G-force, gauges and engine performance. This data can be downloaded through the Universal Serial Bus (USB) port or the Secure Digital (SD) card slot in the vehicle for saving or sharing of performance results data.
  - **Points Of Interest Search** - A Points Of Interest (POI) Search app gives the vehicle owner access to Yelp (POI) local business and destination information previously available on the internet or through a mobile app, adapted for use on the radio in their vehicle. The Yelp POI Search app provides searches using predefined search categories, or custom searches using keywords and voice recognition.
  - **Via Mobile** - The Via Mobile app leverages apps already installed on a compatible and paired iPhone or Android smart phone to enable accessibility to streaming internet audio content through the RRM and audio system components within the vehicle. This app enables one touch access and a hands-free, radio-like user interface with no expenses besides those already being incurred to access the same content through the existing smart phone data plan. There are presently smart phone apps available for streaming audio content such as Aha Radio, iHeart Radio, Pandora and Slacker. When additional apps are made available there could potentially be access to streaming news, sports, weather, social media, comedy, audio books and other content such as special interest podcasts.
- **Notifications** - Customers have the option to sign up for automatic electronic mail (email) or text message (Short Message Service/SMS) notifications when an Access remote services command is processed or if their vehicle theft alarm has been triggered. These notifications are set up through the Mopar Owner Connect account of the customer (**www.MoparOwnerConnect.com**).
- **Remote Services** - The distance of remote services normally available through the Remote Keyless Entry (RKE) FOB with Integrated Key (FOBIK) can be extended through cellular connectivity. These services may include remote door Lock/Unlock, remote horn and lights (Panic Mode) and remote start. An active Access subscription is required and the customer must install the Uconnect™ Access Via Mobile smart phone app on their phone. The app can be obtained through the Mopar Owner Connect account of the customer (**www.MoparOwnerConnect.com**) or by downloading it from the play store for their phone. Once the smart phone app is installed, the remote services can be controlled by the customer on line through their Mopar Owner Connect account.

NOTE: **Remote services are only available based on factory installed options. Options installed at the dealer are not eligible for these services.**

- **Stolen Vehicle Assistance** - If the vehicle is stolen, stolen vehicle assistance can be used to help the police locate the vehicle. This service is based on the request of the customer to Uconnect™ Care and must first be reported to local authorities and a police report reference number obtained. Uconnect™ Care will not provide stolen vehicle assistance without a police report reference number.
- **Voice Texting** - Voice Texting enhances the Voice Text Reply feature of the Uconnect™ Access subscription. While Voice Text Reply provides pre-formatted messages, it also lets the customer create custom messages. A message is spoken as if talking to the intended message recipient and the Uconnect™ Access voice-to-text technology converts the voice message into a text message.

NOTE: Voice Texting and Voice Text Reply are compatible with most phones that support Bluetooth Message Access Protocol (MAP) or AT Messaging Protocol. Always check compatibility by accessing Mobile Device Support at: Uconnectphone.com . These features are not available in all markets.

- **Wi-Fi Hot Spot** - Vehicles equipped with the Uconnect™ Access system can become a Wi-Fi hot spot with payment of a daily, weekly or monthly subscription option. This system allows the use of the vehicle as a Wi-Fi hot spot for connecting consumer Wi-Fi devices to the internet through a Wi-Fi antenna and an embedded cellular connection that are internal and integral to the RRM and the external cellular combination antenna. The external combination antenna can be repaired separately from the RRM. The Wi-Fi Hot Spot system software is flash programmable through the Universal Serial Bus (USB) port.

Refer to **www.driveuconnect.com** for the latest information and helpful videos describing all of the Uconnect™ services and offerings.

The Uconnect™ Access system includes the following major components, which are described in further detail elsewhere in this service information:

- **Access Switches** - In vehicles equipped with Uconnect™ Access, the inside rear view mirror also contains two integral push button switches and a Light Emitting Diode (LED) indicator located on the rearward-facing housing just below the center of the mirror glass for activation of the **ASSIST** and **9-1-1** features.
- **Bluetooth™ Antennas** - Bluetooth™ antennas are internal and integral to the Radio Receiver Module (RRM) (also known as the radio or the head unit).
- **Bluetooth™ Phone** - A customer-supplied and paired Bluetooth™ smart phone is a required component of the Uconnect™ Access system to enable remote services.
- **Body Control Module** - The Body Control Module (BCM) is the configuration master node for the vehicle. Refer to **MODULE, BODY CONTROL, DESCRIPTION** .
- **Combination Antenna** - The Radio Receiver Module (RRM) (also known as the radio or the head unit) sends and receives cellular data through a roof-mounted combination antenna that also receives satellite audio and Global Positioning System (GPS) navigation signals. Refer to **ANTENNA, SATELLITE, DESCRIPTION** .
- **Electronic Vehicle Information Center Switch Pod** - The Electronic Vehicle Information Center (EVIC) switch pod is located in the left horizontal spoke of the steering wheel. In addition to the EVIC switch buttons this switch pod contains the Voice Recognition (VR) switch button and the Phone switch button of the hands-free phone system. Refer to **SWITCH, EVIC CONTROL, DESCRIPTION** .
- **Microphones** - Stereo microphones are integral to the inside rear view mirror in vehicles equipped with the hands-free phone system. These microphones are located on the top surface of the mirror housing, one to each side of center. Refer to **MICROPHONE, DESCRIPTION**.
- **Occupant Restraint Controller** - The Occupant Restraint Controller (ORC) module has a dedicated hard wired circuit that provides an input to the Radio Receiver Module (RRM) (also known as the radio or the head unit) whenever a Supplemental Restraint System (SRS) deployment occurs in the vehicle.
- **Radio Frequency Hub Module** - The Radio Frequency Hub Module (RFHM) (also known as the RF Hub) is a key component of the Uconnect™ Access remote vehicle services feature. The RFHM is located on the rear shelf panel support and concealed beneath the shelf panel trim behind the rear seat back within the passenger compartment. Refer to **MODULE, RADIO FREQUENCY (RF HUB),**

DESCRIPTION .

- **Radio Receiver Module** - The Radio Receiver Module (RRM) (also known as the radio or the head unit) is located near the top of the instrument panel center stack area and is the primary component of the Uconnect™ Access system in this vehicle. The RRM includes a microcontroller, a Bluetooth™ transceiver, a navigation module, flash memory and sophisticated Advanced Speech Recognition (ASR) input capability through Voice Recognition (VR) software. The ASR software includes many different available languages. Each vehicle is equipped with a list of available languages, which are made available from the factory based upon languages most commonly used for the market destination. Refer to **RADIO, DESCRIPTION** .
- **Uconnect™ Access Registration And Applications** - Uconnect™ Access registration must be completed before individual RRM apps or Uconnect™ Access subscription packages can be purchased from the Uconnect™ Store Front. The Uconnect™ Access Via Mobile smart phone app must also be installed on the user's compatible smart phone for the remote vehicle services features to operate. Many additional Uconnect™ Access apps are under development for later release.
- **Wi-Fi Antenna** - The Wireless Local Area Network (WLAN) (also known as Wi-Fi) antenna is internal and integral to the RRM.
- **Wi-Fi Device** - A customer-supplied Wi-Fi capable device is a required component of the Wi-Fi Hot Spot system.

The RRM contains a microcontroller and programming that allows it to communicate with other electronic modules in the vehicle over the Controller Area Network - Interior High Speed (CAN-IHS) data bus. In vehicles equipped with Uconnect™ Access, the RRM also uses electronic message communication with other electronic modules in the vehicle over the CAN-C data bus. Refer to **COMMUNICATION, DESCRIPTION** .

The Uconnect™ Access system components cannot be adjusted or repaired. If any Uconnect™ Access system component is damaged or ineffective, that component must be replaced. The external combination antenna can be repaired separately from the RRM. The Uconnect™ Access system software is flash programmable through the Universal Serial Bus (USB) port.

OPERATION

HANDS FREE PHONE

The Uconnect™ Hands Free Phone system relies upon Bluetooth™ technology to enable wireless connectivity between Bluetooth™ compatible, paired and turned On mobile devices and the on-board entertainment system components. This system also relies upon Advanced Speech Recognition (ASR) software to enable Voice Commands to control the mobile device as well as the components and features of some other on-board systems.

The system will recognize up to ten Bluetooth™ compatible devices, each of which is identified within the system by the name acquired from the device during the pairing process. The Hands Free Phone system will communicate with a paired device that is anywhere within the vehicle. However, covering the paired device with a metal object may block the signal.

The Hands Free Phone system is operated in one of two ways: actively or passively. Active operation begins with the vehicle operator depressing a push button in the Electronic Vehicle Information Center (EVIC) switch pod on the face of the left horizontal spoke of the steering wheel. The Uconnect™ Voice Recognition (**VR**) (also known as Voice Command) button is depressed for hands free Voice Command access to available

features other than the phone, or the Uconnect™ Phone (**Phone** is identified by a phone handset icon) button is depressed for hands free phone access.

The **VR** or **Phone** button press provides a resistor multiplexed input to the Local Interface Network (LIN) slave node integral to the EVIC switch pod. The LIN slave node sends an electronic **switch press** message to the LIN master node integral to the Body Control Module (BCM). The BCM is also a gateway to the CAN - Interior High Speed (CAN-IHS) data bus and relays the message over the CAN-IHS data bus to the Radio Receiver Module (RRM) (also known as the radio or the head unit).

When the RRM receives the electronic **switch press** message, the RRM suppresses any current audio output and issues an audible **beep** to indicate that the VR hardware is prepared to receive a Voice Command. Part of the Uconnect™ Hands Free Phone system hardware includes the VR stereo microphones integral to the top surface of the inside rear view mirror. The microphones provide a hard wired input of Voice Commands to the VR engine within the RRM, and the ASR software converts that input into an electronic instruction message broadcast over the CAN-IHS data bus to invoke the appropriate system response. If no appropriate Voice Command is received within a few seconds following the audible **beep** , the system will provide an audible verbal output listing a menu of the available Voice Command options.

Passive operation begins when an incoming cellular call is received. If the Bluetooth™ phone is Short Message Service (SMS) text message capable and compatible with the Uconnect™ system (see the Uconnect™ web site), passive operation will also begin when an SMS text message is received. The call or SMS text message is relayed to the Bluetooth™ transceiver embedded within the RRM. The Bluetooth™ transceiver then instructs the RRM to announce the incoming call or message. The vehicle operator presses the Uconnect™ **Phone** button in the EVIC switch pod or the soft button that will appear in the RRM display to accept the call, or the soft button that will appear in the RRM display to accept the message.

The Bluetooth™ transceiver connects the voices of the two phone parties using outputs through the audio system speakers and inputs through the Uconnect™ hands free microphones. In the case of a text message, the Bluetooth™ transceiver sends the message to the VR hardware and the ASR software converts the message from text to voice and plays it through the audio system speakers.

If the RRM has the optional 213 millimeter (8.4 inch) electronic touchscreen display, the text message can then be replied to by depressing the Uconnect™ **VR** button and giving an **SMS** Voice Command to select from several predetermined short text phrase responses. If the RRM has the 127 millimeter (5 inch) display, it can receive and display SMS text messages, but it is not equipped to reply to text messages.

The Hands Free Phone system operates on battery current received through a fused B(+) circuit, but also monitors the ignition switch (also known as the Keyless Ignition Node/KIN or IGnition Node Module/IGNM) status through electronic messages received over the CAN-IHS data bus. If a call is in progress when the status of the ignition switch transitions to Off, the system will continue to operate until the call has been completed.

The RRM receives electronic message inputs over the CAN-IHS data bus related to the Hands Free Phone system. The RRM is also connected to the CAN-C data bus; however, the RRM is not a CAN gateway. All electronic message outputs of the RRM are carried over the CAN-IHS data bus. When the RRM monitors a problem in any of the audio system circuits and components, or in any of the Bluetooth™ transceiver circuits, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit.

The hard wired circuits between components related to the RRM and the Hands Free Phone system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The

wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the RRM or the electronic controls and communication between modules and other devices that provide some features of the Hands Free Phone system. The most reliable, efficient and accurate means to diagnose the RRM or the electronic controls and communication related to Hands Free Phone system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

NAVIGATION

The optional navigation system is active whenever the Radio Receiver Module (RRM) (also known as the radio or the head unit) electronic display is powered On. In vehicles equipped with a navigation system that allows activation after the vehicle has been delivered, all post delivery activations must be performed by the dealer.

If a navigation system menu or map isn't being actively displayed, the system is still operating in the background. The menu, map or route that was active when the RRM electronic display was powered Off along with all other user-relevant information is saved in nonvolatile memory by the navigation module for display again the next time the RRM electronic display is powered On and the navigation system is selected.

Once a destination is selected, the navigation system uses information from stored map data to quickly calculate a route. As the vehicle is driven along that route, the vehicle operator is guided with visual displays and voice prompts. Any variances from that route will cause the navigation system to automatically recalculate and deliver a revised route to the chosen destination.

When Turn-By-Turn Navigation is enabled through the Personal Settings menu of the Electronic Vehicle Information Center (EVIC), the EVIC supplements the RRM display with a more focused turn-by-turn display which includes: the name of the approaching crossroad, an arrow indicating the upcoming turn direction and a countdown to indicate the distance to that turn.

All vehicles have their original map and Points-Of-Interest (POI) data stored in nonvolatile flash memory integral to the navigation module integral and internal to the RRM. Updated map and POI data as well as updated navigation software for these vehicles can be uploaded to the system using Universal Serial Bus (USB) media. The originally installed data is based upon the market for which the vehicle was manufactured. Navigation software updates are also uploaded to the system using USB media.

The Global Positioning System (GPS) receiver of the navigation module is capable of acquiring and tracking GPS signal inputs through the roof-mounted combination antenna from numerous satellites simultaneously to calculate and display the position and direction of the vehicle. However, when access to satellite signals is blocked by bridges, tunnels or other obstacles, the navigation module relies upon Dead Reckoning (DR) to aid in calculating vehicle position and direction. The navigation module uses pulse signals from the wheel speed sensors, a Reverse gear indicator input and an internal electronic gyroscope sensor to provide DR vehicle position and direction calculations to supplement GPS satellite signals.

User input mechanisms for the navigation system include the RRM touchscreen and the Uconnect™ Hands-Free Voice Recognition (VR) (also known as Voice Command) verbal commands. The VR function uses Advanced Speech Recognition (ASR) software. Master control of the VR function is handled by the VR engine internal and integral to the RRM. The VR recognizes and responds to certain global commands, while other

commands are specific to the RRM or the navigation system.

For safety reasons some input, editing and setting features of the navigation system are restricted when the vehicle is in motion or when a hands-free phone call is active. This includes many features that require touchscreen inputs. However, many of those same features disabled for touchscreen inputs remain enabled for Uconnect™ Hands-Free VR inputs.

The navigation module receives electronic message inputs within the RRM over the Controller Area Network - Interior High Speed (CAN-IHS) data bus; however, the RRM is not a CAN gateway. All electronic message outputs of the navigation module and the RRM are carried over the CAN-IHS data bus. When the RRM monitors a problem in any of the audio system circuits and components, or in any of the navigation system antenna circuits, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit. The external combination antenna may be diagnosed separately from the RRM.

The hard wired circuits between components related to the RRM and the navigation system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the RRM or the electronic controls and communication between modules and other devices that provide some features of the navigation system. The most reliable, efficient and accurate means to diagnose the RRM or the electronic controls and communication related to navigation system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

UCONNECT ACCESS

Uconnect™ Access capability relies on cellular (telematics) technology and subscribed services that are controlled through Digital Rights Management (DRM). The management or DRM along with specific services occur wirelessly through the cloud. Digital rights and a subscription determine the specific services a customer is eligible to receive. Data feeds between Chrysler assembly plants and its radio suppliers are provided to the cellular provider to enable initial capability or provisioning. This initial data must exist in the database of the cellular provider or functionality will be unavailable. Base features are supported through software that exists within the applicable Radio Receiver Module (RRM) (also known as the radio or the head unit) platform and cellular connectivity is provided through the embedded cellular module.

Signal strength and data capability is shown adjacent to the **Apps** orb soft key found at the lower right corner of the radio touchscreen. Relative signal strength is indicated by a bar graph and data capability is indicated by the display of either a **3G** (full capability), **1X** (text capable only) or a **0** with a strike-through symbol (no data capability). Depending on location and coverage, data capability can change. Signal strength is a major factor for any wireless connectivity. Third Generation (3G) data is the highest connectivity available at this time. Remote Service features (Start, Lock, Unlock, etc.) rely on data capability. If the vehicle is located in an area of no or low coverage, the Remote Services features may not function. Signal strength and data capability can suffer from the same situations any cellular device might experience. Parking structures, blocks, drops and dead zones can affect performance at any time.

The two switch buttons on the inside rear view mirror identified with **ASSIST** and **9-1-1** provide a resistor multiplexed input to the Local Interface Network (LIN) slave node integral to the inside rear view mirror. The

LIN slave node sends an electronic **switch press** message to the LIN master node integral to the Body Control Module (BCM). The BCM relays the message over the Controller Area Network - Interior High Speed (CAN-IHS) data bus, where it is retrieved by the RRM.

If the vehicle has the optional Uconnect™ Access Via Mobile application (also known as app) downloaded, installed and enabled on their smart phone their Uconnect™ Access subscription can provide remote services features. In the Uconnect™ Access system the Via Mobile app on the smart phone calls the RRM in the vehicle. The RRM communicates through electronic messages over the Controller Area Network - C (CAN-C) data bus with the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) and the RFHM communicates over the CAN-C bus with the Body Control Module (BCM) to achieve the requested remote features. While the RRM uses electronic message communication over both the CAN-C data bus and the CAN - Interior High Speed (CAN-IHS) data bus, the RRM is not a CAN gateway.

If a Bluetooth™ phone is Short Message Service (SMS) text message capable and compatible with the Uconnect™ Access system (see the Uconnect™ web site for a phone compatibility list), a Uconnect™ Access subscription provides an enhanced Voice Texting feature. This SMS text message free form dictation feature is used to compose a response when a text message is received. The call or SMS text message is relayed to the Bluetooth™ transceiver embedded within the RRM. The Bluetooth™ transceiver then instructs the RRM to announce the incoming call or message. The vehicle operator presses the Uconnect™ **Phone** button in the EVIC switch pod or the soft button that will appear in the RRM touchscreen display to accept the message and dictate a response.

The optional Wi-Fi hot spot feature of Uconnect™ Access utilizes the same operating principles and components as Uconnect™ Access for wireless connectivity. Digital rights to the Wi-Fi hot spot feature are provided based on a subscription separate from Uconnect™ Access. Several wireless devices can be supported in vehicles with the Wi-Fi hot spot feature and security to prevent unauthorized access can be enabled by the customer.

The hard wired circuits between components related to the RRM and the Uconnect™ Access system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the RRM or the electronic controls and communication between modules and other devices that provide some features of the Uconnect™ Access system. The most reliable, efficient and accurate means to diagnose the RRM or the electronic controls and communication related to Uconnect™ Access system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HANDS-FREE PHONE

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS). Refer to RESTRAINTS - SERVICE INFORMATION before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait

two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

The hard wired circuits between components related to the Radio Receiver Module (RRM) (also known as the radio or the head unit) and the Uconnect™ Hands-Free Phone system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the RRM or the electronic controls and communication between modules and other devices that provide some features of the Uconnect™ Hands-Free Phone system. The most reliable, efficient and accurate means to diagnose the RRM or the electronic controls and communication related to Uconnect™ Hands-Free Phone system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

NOTE: **The MIT019 Multi-Media Interface Tester special tool may also be used for testing where no Diagnostic Trouble Code (DTC) has been recorded, such as with Bluetooth™ reception and phone pairing issues. Refer to DIAGNOSIS AND TESTING .**

NOTE: **Validation and diagnosis of many of the conditions listed below will require access to both the paired Bluetooth™ device and the PIN required for that device.**

HANDS-FREE PHONE DIAGNOSIS		
CONDITION	**POSSIBLE CAUSES**	**CORRECTION**
PHONE NOT AVAILABLE	1. Bluetooth phone not paired to the RRM.	1. Be certain that the phone is Bluetooth compatible and is paired to the RRM.
	2. Bluetooth phone not present or turned Off.	2. Be certain that the paired phone is present, turned On and that the Bluetooth option is enabled in the phone.
	3. Bluetooth phone has low battery.	3. At low battery levels, some phones will turn Off Bluetooth functionality. Be certain that the phone battery is charged to an adequate level.
	4. The boot procedure for the RRM, the phone or both did not complete successfully.	4. Cycle both the RRM and the phone Off, then On again in an attempt to complete a successful boot procedure.
	5. A phone freeze has occurred.	5. Power cycle the phone. Refer to the operator's manual for the phone.
PHONE PAIRING FAILED	1. The phone is not Bluetooth enabled.	1. The Bluetooth transceiver requires that the cellular phone be Bluetooth enabled. The phone must be upgraded to one that is Bluetooth enabled. A list of suggested phones is available at: **http://www.chrysler.com/uconnect**

HANDS-FREE PHONE DIAGNOSIS		
CONDITION	**POSSIBLE CAUSES**	**CORRECTION**
	2. The phone does not support the Bluetooth Hands-Free Profile.	2. The Bluetooth transceiver requires that the cellular phone support the Hands-Free Profile. The phone must be upgraded to one that supports the Hands-Free Profile. A list of suggested phones is available at: **http://www.chrysler.com/uconnect**
	3. Incorrect discovered Bluetooth device selected in phone.	3. Be certain to select Uconnect in the discovered Bluetooth™ devices in the phone for pairing.
	4. The PIN of the phone is not the same as the PIN assigned by the RRM during pairing.	4. The PIN assigned by the RRM during pairing must match the PIN of the phone.
	5. Phone pairing is locked (password protected).	5. To unlock phone pairing in the phone, be certain that password protection is turned Off.
	6. The RRM has reached the maximum number of allowed devices paired.	6. Remove one of the previously paired devices from the paired list of the RRM.
	7. The phone has reached the maximum number of allowed devices paired.	7. Remove one of the previously paired devices from the paired list of the phone, or delete the pairing history from the phone. Refer to the operator's manual for the phone.
	8. The boot procedure for the RRM, the phone or both did not complete successfully.	8. Cycle both the RRM and the phone Off, then On again in an attempt to complete a successful boot procedure.
	9. A phone freeze has occurred.	9. Perform a hard reset (power cycle) to the phone. Refer to the operator's manual for the phone.
PHONE WILL NOT RECONNECT AFTER PAIRING	1. Bluetooth settings in phone are incorrect.	1. Bluetooth settings in phone should be set to auto-connect or select Uconnect™ as a trusted device in phone.
	2. Phone pairing is locked (password protected).	2. To unlock phone pairing in the phone, be certain that password protection is turned Off.
	3. The boot procedure for the RRM, the phone or both did not complete successfully.	3. Cycle both the RRM and the phone Off, then On again in an attempt to complete a successful boot procedure.
	4. A phone freeze has occurred.	4. Perform a hard reset (power cycle) to the phone. Refer to the operator's manual for the phone.
POOR VOICE RECOGNITION	1. User is not waiting for the **beep** tone acknowledgement before issuing Voice	1. Be certain the user knows to wait for the acknowledgement **beep** tone prior to issuing Voice Commands.

HANDS-FREE PHONE DIAGNOSIS		
CONDITION	**POSSIBLE CAUSES**	**CORRECTION**
	Commands.	
	2. User is not issuing Voice Commands in a smooth and consistent speaking voice.	2. Be certain the user is issuing Voice Commands in a normal, smooth and consistent speaking voice. The Advanced Speech Recognition (ASR) engine is designed to recognize normal speech patterns and at a normal tone. Some users tend to speak to a computer loud and slow, which results in reduced performance.
	3. User is not using proper Voice Command syntax.	3. User must speak using proper Voice Command syntax.
	4. High noise levels within the passenger compartment.	4. ASR engine performance is increased when noise conditions in the passenger compartment are lowered. Ideal conditions include having the windows closed and the blower fan set to Low or Off.
	5. Passengers are talking while the user is attempting to issue a Voice Command.	5. Although designed to focus on sounds from the driver's seated position, the directional microphones will pick up sounds from any seating position in the vehicle. ASR engine performance is increased in low noise environments.
	6. Foreign objects interfering with microphone input.	6. Verify that there are no foreign objects hanging from the inside rear view mirror that could be interfering with microphone reception.
	7. The inside rear view mirror is not properly attached to the mount.	7. The inside rear view mirror must be firmly mounted to the mounting location. Be certain the mirror is properly installed.
	8. The incorrect Uconnect switch button is being depressed.	8. Phone features are accessed using the Uconnect **Phone** button on the steering wheel or the **Phone** soft key in the RRM display. Other Uconnect Voice Command features are accessed using the Uconnect **VR** button or soft key.
	9. Microphone failure.	9. Use a diagnostic scan tool and the appropriate diagnostic procedures for further diagnosis of the microphone.
PHONE BOOK DOES NOT DOWNLOAD	1. Phone does not support the Phone Book Access Profile (PBAP).	1. The Uconnect system requires that the cellular phone support the PBAP profile. To enable the Uconnect phone book download feature, the phone must be upgraded to one that is PBAP enabled. A list of suggested phones is available at:

HANDS-FREE PHONE DIAGNOSIS		
CONDITION	**POSSIBLE CAUSES**	**CORRECTION**
		http://www.chrysler.com/uconnect
	2. Phone book transfer not enabled in phone during pairing.	2. Be certain that phone book transfer is accepted or enabled in the phone during pairing to enable the Uconnect phone book download feature.
	3. Missing contacts from downloaded phone book.	3. Only contacts with a phone number are downloaded from phone and the number of contacts downloaded is limited to 1000.
PHONE BOOK NAMES NOT RECOGNIZED CONSISTENTLY	1. User is not waiting for the **beep** tone acknowledgement before issuing Voice Commands.	1. Be certain the user knows to wait for the acknowledgement **beep** tone prior to issuing Voice Commands.
	2. User is not issuing Voice Commands in a smooth and consistent speaking voice.	2. Be certain the user is issuing Voice Commands in a normal, smooth and consistent speaking voice. The Advanced Speech Recognition (ASR) engine is designed to recognize normal speech patterns and at a normal tone. Some users tend to speak to a computer loud and slow, which results in reduced performance.
	3. User is not using proper Voice Command syntax.	3. User must speak using proper Voice Command syntax (i.e.: say **Call** - then name, or say **Dial** - then number).
	4. Phone book names too short.	4. For increased performance, it is recommended to use both first and last names for phone book entries. Example: **Daniel Johnson** as opposed to **Dan** .
	5. Name not spoken by user as it appears in the phone book.	5. Speak the full contact name as it appears in the phone book. Do not use nicknames.
	6. Multiple similar sounding names in the phone book.	6. For increased performance it is recommended that the user do not enter similar sounding names in the phone book.
	7. Phone book download not yet completed.	7. Depending upon the size of the contact list on the phone, the download may not have had time to complete. If the Phone Book button on the RRM phone screen appears grayed out, the contact list download is still in progress. Wait until download completes.
	8. High noise levels within the passenger compartment.	8. ASR engine performance is increased when noise conditions in the passenger compartment are lowered. Ideal conditions include having the windows closed and the blower fan set to Low or Off.

HANDS-FREE PHONE DIAGNOSIS		
CONDITION	**POSSIBLE CAUSES**	**CORRECTION**
	9. Passengers are talking while the user is attempting to issue a Voice Command.	9. Although designed to focus on sounds from the driver's seated position, the directional microphones will pick up sounds from any seating position in the vehicle. ASR engine performance is increased in low noise environments.
	10. Foreign objects interfering with microphone input.	10. Verify that there are no foreign objects hanging from the inside rear view mirror that could be interfering with microphone reception.
	11. The inside rear view mirror is not properly attached to the mount.	11. The inside rear view mirror must be firmly mounted to the mounting location. Be certain the mirror is properly installed.
	12. The incorrect Uconnect switch button is being depressed.	12. Phone features are accessed using the Uconnect **Phone** button on the steering wheel or the **Phone** soft key in the RRM display. Other Uconnect Voice Command features are accessed using the Uconnect **VR** button or soft key.
	13. Microphone failure.	13. Use a diagnostic scan tool and the appropriate diagnostic procedures for further diagnosis of the microphone.
POOR PHONE AUDIO QUALITY	1. High noise levels within the passenger compartment.	1. ASR engine performance is increased when noise conditions in the passenger compartment are lowered. Ideal conditions include having the windows closed and the blower fan set to Low or Off.
	2. Passengers are talking while the user is attempting to issue a Voice Command.	2. Although designed to focus on sounds from the driver's seated position, the directional microphones will pick up sounds from any seating position in the vehicle. ASR engine performance is increased in low noise environments.
	3. Foreign objects interfering with microphone input.	3. Verify that there are no foreign objects hanging from the inside rear view mirror that could be interfering with microphone reception.
	4. The inside rear view mirror is not properly attached to the mount.	4. The inside rear view mirror must be firmly mounted to the mounting location. Be certain the mirror is properly installed.
	5. Microphone failure.	5. Use a diagnostic scan tool and the appropriate diagnostic procedures for further diagnosis of the microphone.

HANDS-FREE PHONE DIAGNOSIS		
CONDITION	**POSSIBLE CAUSES**	**CORRECTION**
NO PHONE AUDIO	1. The settings in the phone cause the phone audio to be routed to a handset.	1. Route the phone audio to the hands-free device.
CALL LOG INOPERATIVE OR INACCURATE	1. Call log not supported by phone.	1. The Uconnect system requires that the cellular phone support the call log feature. To enable the Uconnect call log feature, the phone must be upgraded to one that is call log enabled. A list of suggested phones is available at: **http://www.chrysler.com /uconnect**
	2. The phone is not providing accurate call log data.	2. Refer to the operator's manual for the phone.
AUDIO OUTPUT TOO LOW	1. Volume setting on the Bluetooth device set too low.	1. Set the volume of the phone or other Bluetooth device to about three quarters (3/4) of full or maximum volume.
	2. Volume setting on the RRM set too low.	2. Set the volume of the RRM to the desired level during an active Uconnect Hands-Free Phone call session.

DIAGNOSIS AND TESTING - NAVIGATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS). Refer to RESTRAINTS - SERVICE INFORMATION before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

The hard wired circuits between components related to the Radio Receiver Module (RRM) (also known as the radio or the head unit) and the Uconnect™ Navigation system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the RRM or the electronic controls and communication between modules and other devices that provide some features of the Uconnect™ Navigation system. The most reliable, efficient and accurate means to diagnose the RRM or the electronic controls and communication related to Uconnect™ Navigation system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING - UCONNECT ACCESS

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS). Refer to RESTRAINTS - SERVICE INFORMATION before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

The hard wired circuits between components related to the Radio Receiver Module (RRM) (also known as the radio or the head unit) and the Uconnect™ Access system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the RRM or the electronic controls and communication between modules and other devices that provide some features of the Uconnect™ Access system.

A Light Emitting Diode (LED) indicator between the inside rear view mirror push buttons provides an indication of the status of the Uconnect™ Access embedded cellular device. Any fault indication is accompanied by a pop up screen in the RRM electronic touchscreen display. The following indications are provided whenever the status of the ignition switch is On or Accessory:

- **Solid Green** - No active call.
- **Flashing Green** - A Uconnect™ Access Care or 9-1-1 call is active.
- **Solid Red** - A CAN, embedded cellular device, cellular antenna or wiring fault has been detected.
- **Off** - No power supply to the rear view mirror.

In addition to the LED indicator on the mirror, one of the following error messages may appear in the RRM touchscreen display. These error messages will coincide with a solid red mirror LED indication.

- **Critical VIN Error** - This message typically indicates the radio data was not provisioned with the back end database, or that critical data within the RRM is missing. Diagnosis of this type of failure will require the assistance of the network provider.
    1. Enter the **Dealer Mode** menu by selecting the temperature up, temperature down and front defrost buttons simultaneously until the menu appears (about 5 to 8 seconds).
        1. Navigate through the **System Information** menu to the **Radio Part Information** menu.
        2. Write down the **Serial Number** listed on the **Radio Part Information** menu. The serial number begins with the characters, **T00BE** .
    2. Navigate back to the **Dealer Mode** menu.
        1. Navigate through the **##Menu Basic** menu to the **##RTN#** menu.
        2. Write down the **MDN** number listed on the **##RTN#** menu.
        3. Write down the **MSID** number listed on the **##RTN#** menu.
    3. Place a call to Uconnect™ Care. Provide your dealer code, name, call back number and the Vehicle Identification Number (VIN). Request a ticket be opened with the network engineers to assist with

Uconnect™ Access diagnostics. A ticket will be opened with the network engineers and a call back will occur within 15 minutes for further assistance and diagnostics.

- **Vehicle Phone Requires Service** - This message can indicate a fault with the antenna, the inside rear view mirror, communication with the Occupant Restraint Controller (ORC) module or any of the hard wired circuits between these components. Check for an active or stored Diagnostic Trouble Code (DTC) for any of the listed components. Follow all of the steps found in the diagnostic information for the retrieved DTC and fully check the hard wired circuitry associated with the DTC. If no DTC can be retrieved, an internal failure within the RRM may exist.

The Wi-Fi hot spot feature can only be diagnosed if the customer has subscribed for this additional feature. The same diagnostic steps associated with Uconnect™ Access will be used for Wi-Fi hot spot as they share the same network. In addition, each of the wireless devices of the customer must be properly paired for them to work.

NOTE: **The MIT019 Multi-Media Interface Tester special tool may also be used for testing where no Diagnostic Trouble Code (DTC) has been recorded, such as with Bluetooth™ reception and phone pairing issues. Refer to DIAGNOSIS AND TESTING .**

NOTE: **Validation and diagnosis of many of the conditions listed below will require access to both the paired Bluetooth™ device and the PIN required for that device.**

UCONNECT ACCESS DIAGNOSIS		
CONDITION	**POSSIBLE CAUSES**	**CORRECTION**
POOR VOICE RECOGNITION	1. User is not waiting for the **beep** tone acknowledgement before issuing Voice Commands.	1. Be certain the user knows to wait for the acknowledgement **beep** tone prior to issuing Voice Commands.
	2. User is not issuing Voice Commands in a smooth and consistent speaking voice.	2. Be certain the user is issuing Voice Commands in a normal, smooth and consistent speaking voice. The Advanced Speech Recognition (ASR) engine is designed to recognize normal speech patterns and at a normal tone. Some users tend to speak to a computer loud and slow, which results in reduced performance.
	3. User is not using proper Voice Command syntax.	3. User must speak using proper Voice Command syntax.
	4. High noise levels within the passenger compartment.	4. ASR engine performance is increased when noise conditions in the passenger compartment are lowered. Ideal conditions include having the windows closed and the blower fan set to Low or Off.
	5. Passengers are talking while the user is attempting to issue a Voice Command.	5. Although designed to focus on sounds from the driver's seated position, the directional microphones will pick up sounds from any seating position in the vehicle. ASR engine performance is increased in low noise

UCONNECT ACCESS DIAGNOSIS		
CONDITION	**POSSIBLE CAUSES**	**CORRECTION**
		environments.
	6. Foreign objects interfering with microphone input.	6. Verify that there are no foreign objects hanging from the inside rear view mirror that could be interfering with microphone reception.
	7. The inside rear view mirror is not properly attached to the mount.	7. The inside rear view mirror must be firmly mounted to the mounting location. Be certain the mirror is properly installed.
	8. The incorrect Uconnect switch button is being depressed.	8. Phone features are accessed using the Uconnect **Phone** button on the steering wheel or the **Phone** soft key in the RRM display. Other Uconnect Voice Command features are accessed using the Uconnect **VR** button or soft key.
	9. Microphone failure.	9. Use a diagnostic scan tool and the appropriate diagnostic procedures for further diagnosis of the microphone.
TEXT MESSAGING INOPERATIVE	1. The Bluetooth Message Access Profile (MAP) is not supported by the phone.	1. The Uconnect system requires that the cellular phone support the Bluetooth MAP for the text messaging feature. To enable the Uconnect text messaging feature, the phone must be upgraded to one that supports Bluetooth MAP. A list of suggested phones is available at: **http://www.chrysler.com/uconnect**
	2. The Connect-To-Your-Messages setting has not been accepted on the phone.	2. Accept the Connect-To-Your-Messages setting on the phone. Refer to the operator's manual for the phone.
ENHANCED VOICE-TO-TEXT (DICTATED) MESSAGING RESPONSE FEATURE INOPERATIVE	1. Uconnect registration incomplete.	1. Select the **Apps** soft key in the RRM display, then select the **Uconnect Registration App** soft key from the **Apps** list. For further assistance press the **ASSIST** button on the inside rear view mirror to contact Uconnect Customer Care.
	2. Uconnect Access subscription service is inactive.	2. This feature is only available with the Uconnect Access Advantage subscription service. Be certain that the subscription service account is active in the RRM.
	3. The Bluetooth Message Access Profile (MAP) is not supported by the phone.	3. The Uconnect system requires that the cellular phone support the Bluetooth MAP for the text messaging feature. To enable the Uconnect text messaging feature, the phone must be upgraded to one that supports Bluetooth MAP. A list of suggested phones is available at: **http://www.chrysler.com/uconnect**

UCONNECT ACCESS DIAGNOSIS		
CONDITION	**POSSIBLE CAUSES**	**CORRECTION**
	4. The Connect-To-Your-Messages setting has not been accepted on the phone.	4. Accept the Connect-To-Your-Messages setting on the phone. Refer to the operator's manual for the phone.
UNABLE TO PURCHASE APPLICATIONS FROM UCONNECT STORE FRONT	1. Uconnect registration incomplete.	1. Select the **Apps** soft key in the RRM display, then select the **Uconnect Registration App** soft key from the **Apps** list. For further assistance press the **ASSIST** button on the inside rear view mirror to contact Uconnect Customer Care.
	2. Wallet is not set up.	2. Set up a valid wallet for the Uconnect store front in order to purchase application subscriptions.
	3. Cellular antenna issue.	3. Refer to the Audio And Video System service information for further diagnosis of the cellular (combination) antenna. See **AUDIO/VIDEO /ENTERTAINMENT/CONNECTIVITY - SERVICE INFORMATION** .
REMOTE SERVICES INOPERATIVE	1. Uconnect registration incomplete.	1. Select the **Apps** soft key in the RRM display, then select the **Uconnect Registration App** soft key from the **Apps** list. For further assistance press the **ASSIST** button on the inside rear view mirror to contact Uconnect Customer Care.
	2. Phone is not compatible.	2. Be certain that the phone is compatible and is paired to the RRM. A list of suggested phones is available at: **http://www.chrysler.com/uconnect** .
	3. Uconnect Access Via Mobile application (app) not downloaded or not fully installed to smart phone.	3. Download the Uconnect Access Via Mobile app to the user's smart phone from **www.MoparOwnerConnect.com** . Allow sufficient time for the Uconnect Access Via Mobile application (app) download to smart phone to complete. Download times will vary widely with the throughput performance of the user's smart phone and the accessibility of the user's cellular network services.
	4. Uconnect Access subscription service is inactive in the RRM.	4. This feature is only available with the Uconnect Access Advantage subscription service. Be certain that the subscription service account is active in the RRM.
	5. Cellular antenna issue.	5. Refer to the Audio And Video System service information for further diagnosis of the cellular (combination) antenna. See **AUDIO/VIDEO /ENTERTAINMENT/CONNECTIVITY - SERVICE INFORMATION** .

UCONNECT ACCESS DIAGNOSIS		
CONDITION	**POSSIBLE CAUSES**	**CORRECTION**
	5. Radio Frequency Hub Module (RFHM) issue.	5. Further diagnosis of the RFHM requires the use of a diagnostic scan tool and the appropriate diagnostic procedures.
AUDIO OUTPUT TOO LOW	1. Volume setting on Bluetooth device set too low.	1. Set the volume of the phone or other Bluetooth device to about three quarters (3/4) of full or maximum volume.
	2. Volume setting on the RRM.	2. Set the volume of the RRM to the desired level during an active Uconnect Access feature session.
UCONNECT ACCESS INOPERATIVE - NO GREEN OR RED LED INDICATOR	1. Status of ignition switch is Off.	1. Ignition switch status must be On or Accessory during Uconnect Access operation.
	2. Inside rear view mirror wiring not connected.	2. Be certain the wire harness for the inside rear view mirror is connected and fully engaged.
	3. Ineffective ground circuit.	3. Test and repair the open inside rear view mirror ground circuit if required.
	4. Ineffective feed circuit.	4. Test and repair the open inside rear view mirror feed circuit if required.
UCONNECT ACCESS INOPERATIVE - GREEN LED INDICATOR	1. Uconnect registration incomplete.	1. Select the **Apps** soft key in the RRM display, then select the **Uconnect Registration App** soft key from the **Apps** list. For further assistance press the **ASSIST** button on the inside rear view mirror to contact Uconnect Customer Care.
	2. Uconnect Access subscription service is inactive in the RRM.	2. Many Uconnect Access features are only available with the Uconnect Access subscription service. Be certain that the subscription service account is active in the RRM.
	3. Uconnect Access application (app) corrupt or improperly installed.	3. Perform the Uconnect Access System Reinstall Applications Standard Procedure. Refer to STANDARD PROCEDURE.
UCONNECT ACCESS INOPERATIVE - RED LED INDICATOR	1. Loss of Controller Area Network (CAN) - Interior High Speed (IHS) or CAN-C communication.	1. Further diagnosis of CAN-IHS or CAN-C communication requires the use of a diagnostic scan tool and the appropriate diagnostic procedures.
	2. Cellular antenna issue.	2. Refer to the Audio And Video System service information for further diagnosis of the cellular (combination) antenna. See AUDIO/VIDEO /ENTERTAINMENT/CONNECTIVITY - SERVICE INFORMATION .
	3. Ineffective embedded cellular device.	3. Further diagnosis of the RRM requires the use of a diagnostic scan tool and the appropriate diagnostic procedures. Test and replace the RRM, if required.

UCONNECT ACCESS DIAGNOSIS		
CONDITION	**POSSIBLE CAUSES**	**CORRECTION**
WI-FI HOT SPOT INOPERATIVE	1. Uconnect registration incomplete.	1. Select the **Apps** soft key in the RRM display, then select the **Uconnect Registration App** soft key from the **Apps** list. For further assistance press the **ASSIST** button on the inside rear view mirror to contact Uconnect Customer Care.
	2. Uconnect Wi-Fi subscription service is inactive or expired in the RRM.	2. This feature is only available with the Uconnect Wi-Fi subscription service. Be certain that the subscription service account is active in the RRM.
	3. Wi-Fi capability is not enabled in user's Bluetooth device.	3. Confirm Wi-Fi setting in user's Bluetooth device is enabled. Refer to the user's manual for that device.
	4. Selected Wireless Access Point (WAP) is incorrect.	4. Confirm that correct WAP is selected in user's Bluetooth device. Refer to the user's manual for that device.
	5. Wireless Access Point (WAP) password or security settings incorrect.	5. Use the Application Settings menu of the RRM display to confirm or adjust the WAP password and security settings.
	6. Cellular antenna issue.	6. Refer to the Audio And Video System service information for further diagnosis of the cellular antenna. See **AUDIO/VIDEO /ENTERTAINMENT/CONNECTIVITY - SERVICE INFORMATION** .

STANDARD PROCEDURE

NAVIGATION SYSTEM - ACTIVATION

In vehicles equipped with the optional Navigation Ready version of the Radio Receiver Module (RRM) (also known as the radio or the head unit), if the customer chooses to have the navigation system activated, the vehicle must be returned to the dealer for system activation. The dealer activates the navigation system as follows:

NOTE: **Once a Radio Receiver Module (RRM) (also known as the radio or the head unit) with the Navigation Ready feature has had the Navigation feature activated, any factory replacement RRM for the same vehicle will be provided with the Navigation system already activated.**

1. Place the RRM into Dealer Mode using a simultaneous 3 button press of the driver side Temperature Up, driver side Temperature Down and Front Defrost push buttons.
2. The Dealer Mode screen will appear in the RRM display showing the System Information menu. Select the **VP3 Navigation Activation** menu item.
3. A Navigation Activation screen appears advising that an Activation Code needs to be purchased and referencing Technical Service Bulletin (TSB) 08-031-12. A 16 digit alpha numeric Request Code appears just below the displayed text.

4. With the Request Code and the Vehicle Identification Number (VIN), log onto the DealerConnect web site (**https://dealerconnect.chrysler.com/**). Locate the Navigation Activation link on the web site, enter the Request Code and VIN as appropriate. The web site will respond with an alpha numeric Activation Code.

   NOTE: **During the initial launch of this product, the dealer will be provided with a Navigation Activation phone number (Nokia Location And Content Call Center) to use in order to obtain an Activation Code rather than the DealerConnect link mentioned in Step 4.**

5. With the Activation Code, go back to the RRM and press the **OK** button on the Navigation Activation screen. A Data Entry screen will appear. Enter the Activation Code, then press the **OK** button on the Data Entry screen.
6. The navigation system has now been activated using the hardware and software that was installed in the RRM at the time that it was manufactured. If the customer wishes to update the factory installed map and Points-Of-Interest (POI) software, it may be purchased at the customer's expense and downloaded from the Navteq Maps web site (**www.navigation.com**). See Navigation System - Restore Or Update. Refer to STANDARD PROCEDURE.

NAVIGATION SYSTEM - RESTORE OR UPDATE

Navigation System map and Point-Of-Interest (POI) data updates may become available occasionally through the Navteq Maps web site (www.navigation.com). The updated information as well as some additional feature applications can be downloaded and copied to Universal Serial Bus (USB) media for transfer and installation to the navigation module within the Radio Receiver Module (RRM) (also known as the radio or the head unit) in the vehicle. These are fee-based applications and updates, which are made at the option and expense of the customer.

However, a new RRM is equipped with only a standard base version of the map and POI data. Before an original RRM is replaced by the dealer with a new unit, the version of the map and POI data on the original RRM must be noted. If the version of the map and POI data found on the new RRM is not equal to or newer than the version that was found on the replaced RRM, updated data will have to be downloaded and installed to the new RRM at the expense of the dealer.

UCONNECT ACCESS SYSTEM - REINSTALL APPLICATIONS

NOTE: **The following procedure may assist the dealer technician in diagnosis by reloading the applications for which the vehicle owner or operator has valid subscriptions. This is primarily used to troubleshoot any application provisioning or data corruption issues. The reinstallation process may take up to 30 minutes, depending upon the number of apps and the cellular signal strength seen on the Apps orb of the Radio Receiver Module (RRM). In addition, reinstalling applications may correct a Digital Rights Management (DRM) concern that is causing a No Subscription error for customers that were fully registered. This process may also help force DRM synchronization following a software or firmware update.**

The Reinstall Applications procedure can only be initiated from the touchscreen of the Radio Receiver Module (RRM) (also known as the radio or the head unit).

During this procedure, the subscribed applications are removed from the RRM and reinstalled based upon data found on the cloud server. The applications reinstalled onto the RRM will be based upon valid subscriptions and is referred to as Digital Rights.

1. Navigate through the **Apps > Uconnect Store > My Apps > Settings** on the RRM touchscreen.
2. Select **Reinstall Apps** .
3. Press the **Continue** soft key to initiate the Reinstall Applications procedure, or press the **Help** soft key for more information.
4. When the **Apps reinstalled. Radio will restart shortly.** screen appears, press the **OK** soft key.
5. Once the request is processed, a screen will appear alerting the customer with the message, **Important: Application Data Reset Initiated. After Radio Resets, all application data will be lost. Please Wait.** After the RRM reset occurs, the apps will begin to be reinstalled. The reinstallation process may take up to 30 minutes, depending upon the number of apps and the cellular signal strength seen with the bar graph on the **Apps** soft key orb in the lower right corner of the RRM touchscreen.

NOTE: One or two ignition cycles (including bus time-outs) may speed the reloading process following the radio reset.

UCONNECT ACCESS SYSTEM - REMOVE ACCOUNTS

NOTE: The following procedure is provided to the dealer technician as INFORMATION ONLY. This procedure is intended for use by the vehicle owner or operator. This procedure is used when selling the vehicle or cancelling the Uconnect Access account. Removing the account will disassociate the Vehicle Identification Number (VIN) from the account and remove Uconnect Access features from the vehicle. The Uconnect Access features can be reinstated by repeating the registration process through the Radio Receiver Module (RRM) (also known as the radio or the head unit) and following the directions associated with registering for Uconnect Access.

The Remove Accounts procedure can be initiated by one of three methods:

- Through the touchscreen of the RRM.
- Through the Uconnect™ Call Center (**ASSIST** button on inside rear view mirror) or under **Uconnect™ Apps** selection of the RRM display.
- Through the Uconnect™ Owners information accessed through the Mopar Owner Connect web site (www.moparownerconnect.com).

The following describes the Remove Accounts procedure accomplished through the RRM touchscreen:

1. Navigate through **Apps** > **Uconnect Store** > **My Apps** > **Settings** on the RRM touchscreen.
2. Select **Remove Uconnect Account** .
3. Press the **Continue** soft key after each of the two **Warning** screens, or press the **Cancel** soft key to abort the procedure.
4. When the **Authentication** screen is reached, enter the 4 digit **Uconnect Access ID** .
5. Press the **Continue** soft key to continue the Remove Accounts procedure, the **Help** soft key for additional

information or the **Cancel** soft key to abort the Remove Accounts procedure.

6. When the **This vehicle has been removed from your account.** screen appears, press the **OK** soft key. Once the request is processed, a screen will appear alerting the customer with the message, **Important: Application Data Reset Initiated. After Radio Resets, all application data will be lost. Please Wait.**
7. After the radio reset occurs, Uconnect Access applications will no longer be available and the **Uconnect Registration** screen will appear each time the **Apps** soft key is selected until a new valid registration has been successfully completed.

ANTENNA, NAVIGATION

DESCRIPTION

DESCRIPTION

The navigation antenna is integrated into a roof-mounted combination antenna that also receives satellite audio and cellular signals. Refer to **ANTENNA, SATELLITE, DESCRIPTION** .

OPERATION

OPERATION

The navigation module acquires Global Positioning System (GPS) position data through a roof-mounted combination antenna that also receives satellite audio and cellular signals. Refer to **ANTENNA, SATELLITE, DESCRIPTION** .

MICROPHONE

DESCRIPTION

DESCRIPTION

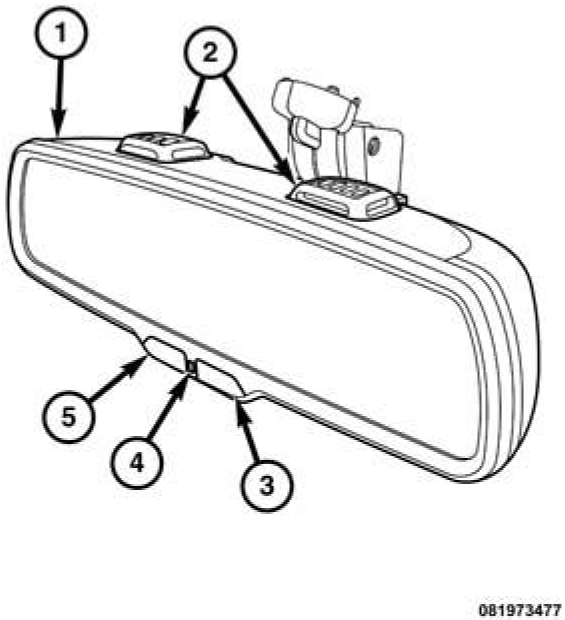

Fig. 1: Stereo Microphones, Rear View Mirror Housing And Push Buttons
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the optional hands-free system have two stereo microphones (2) mounted in the top surface of the inside rear view mirror housing (1), one to each side of center. The two microphones are individually powered by and provide hard wired inputs to the Radio Receiver Module (RRM) (also known as the radio or the head unit) in the instrument panel whenever the Voice Recognition (VR) feature of the hands-free system is active. These two microphones are connected to the vehicle electrical system through a connector receptacle integral to the forward-facing surface of the inside rear view mirror housing by a dedicated take out and connector of the overhead wire harness.

In vehicles equipped with the optional Uconnect™ Access system, the inside rear view mirror system also houses both a **9-1-1** push button (3) and a **Assist** push button (5).

The microphones cannot be adjusted or repaired and, if damaged or ineffective, they must be replaced as a unit with the inside rear view mirror assembly.

OPERATION

OPERATION

When the hands-free Voice Recognition (VR) control circuitry integral and internal to the Radio Receiver Module (RRM) (also known as the radio or the head unit) detects the appropriate inputs or requests, it energizes the circuitry of the two stereo microphones within the inside rear view mirror housing. The microphones remain active until they are deactivated by the hands-free VR control circuitry, or until the status of the ignition switch (also known as the Keyless Ignition Node/KIN or IGnition Node Module/IGNM) transitions to Off, whichever occurs first.

The inputs from the microphones is processed, filtered and redirected by the VR control circuitry and logic as appropriate. Those inputs can be redirected to the Advanced Speech Recognition (ASR) engine or to the audio send circuitry of the Bluetooth™ transceiver. Each of these electronic modules is also integral and internal to

the RRM.

The status of the Uconnect™ Access **Assist** and **9-1-1** push buttons is relayed by the Local Interface Network (LIN) slave node integral to the inside rear view mirror over the LIN data bus to the Body Control Module (BCM) (also known as the Common Body Controller/CBC), which is a LIN master node. The BCM is also a Controller Area Network (CAN) data bus gateway and relays the push button status information to the RRM over the CAN - Interior High Speed (CAN-IHS) data bus.

The hard wired inputs and outputs of the microphones in the inside rear view mirror may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the microphone or the electronic controls and communication between modules and other devices that provide some features of the RRM controlled microphones. The most reliable, efficient and accurate means to diagnose the RRM or the electronic controls and communication related to RRM-controlled microphone operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - MICROPHONE

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS). Refer to RESTRAINTS - SERVICE INFORMATION before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

The hard wired inputs and outputs of the microphones in the inside rear view mirror may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the microphone or the electronic controls and communication between modules and other devices that provide some features of the Radio Receiver Module (RRM) (also known as the radio or the head unit) controlled microphones. The most reliable, efficient and accurate means to diagnose the RRM or the electronic controls and communication related to RRM-controlled microphone operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

The inside rear view mirror mounted microphones used in this vehicle are integral to and serviced only as a unit with the inside rear view mirror. Refer to **MIRROR, REARVIEW, REMOVAL** .

INSTALLATION

INSTALLATION

The inside rear view mirror mounted microphones used in this vehicle are integral to and serviced only as a unit with the inside rear view mirror. Refer to **MIRROR, REARVIEW, INSTALLATION** .

Tires & Wheels - Service Information - Challenger

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - TIRE AND WHEEL VIBRATION

Tire and wheel imbalance, runout and tire road force variation can cause vehicles to exhibit steering wheel vibration and/or seat vibration.

VEHICLES WITH A VIBRATION OR SHAKE

The following procedure is to identify, prevent and correct tire flat spotting.

Description

Immediately following delivery, some vehicles may exhibit a vibration or shake due to temporary tire flat-spotting. The vibration may be felt in the steering wheel or seat and will be most noticeable at highway speeds 96 kph (60 mph). This could be misinterpreted as an out of balance tire. Flat Spotting can occur if the vehicle has not been moved for a few days or for a longer period of time. In most cases it is temporary condition. In extreme cases it can be permanent.

Tire pressure is often inflated to the maximum sidewall pressure at the vehicle assembly plant to prevent "flat spots" on tires during new vehicle shipping and vehicle storage. Inflating tires to the maximum sidewall tire pressure helps to preserve the integrity of the tire and reduces potential technical issues.

It is important to remove temporary flat spotting before performing tire balance, tire run-out or tire road force checks. If the flat spotting is not removed it can result in incorrect measurements.

Flat Spotting Removal

NOTE: **If the vehicle has been sitting for an extended period of time it is recommended to drive the vehicle to warm the tires. This process could eliminate flat spots that can cause vibration.**

1. Drive the vehicle at highway speeds until the vibration (flat spotting) is eliminated.

   NOTE: **In most cases, flat spot vibrations will be eliminated within 20 minutes (about 20 miles) of driving at highway speeds. If the vehicle has been stored without moving for an extended time, it may be necessary to drive the vehicle longer at highway speeds. If the vibration is not completely eliminated during the test drive, proceed to Step 2.**

2. Within 10 minutes after driving the vehicle, raise the vehicle so there is no load on the tires.
3. Check the tire and wheel assemblies for balance, run-out, and road force variation. Refer to **STANDARD PROCEDURE**.
4. Only install new tires after the vehicle has been driven as directed and all appropriate wheel and tire diagnostics have been completed.

VISUAL INSPECTION

Visual inspection of the vehicle is recommended prior to road testing or performing any other procedure. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

Inspect for the following:

- Verify correct (OEM) wheel and tire, as well as presence of wheel weights.
- Inspect tires and wheels for damage, mud packing and unusual wear; correct as necessary.
- Check and adjust tire air pressure to the pressure listed on the label attached to the driver's door opening.

ROAD TEST

NOTE: **If a Noise & Vibration Analyzer is available, use it to diagnosis the issue during the road test.**

NOTE: **If the vehicle has been sitting for an extended period of time it is recommended to drive to warm the tires. This process could eliminate flat spots that can cause vibration.**

Road test vehicle on a smooth road **at and near the designated speed** where legal speed limits allow. Lightly place hands on steering wheel at the 10:00 and 2:00 positions and observe for:

- Steering wheel oscillation: clockwise/counterclockwise
- Steering wheel high frequency movement: rapid vibration up and down
- Seat high frequency movement: rapid vibration up and down

To rule out vibrations due to brakes or powertrain:

- Lightly apply brakes at the designated speed; if vibration occurs or is enhanced, vibration is likely due to a brake concern.
- Shift transmission into neutral while vibration is occurring; if vibration is eliminated, vibration is likely due to a powertrain concern refer to **DIAGNOSIS AND TESTING** for additional information.

TIRE/WHEEL BALANCE AND ROAD FORCE VARIATION

NOTE: **If wheel balance equipment is capable of testing tire road force variation and the tire/wheel assemblies are within specification, place the tires with the greater road force variation on the rear of the vehicle.**

Balance the tire and wheel assemblies as necessary, and if wheel balance equipment is capable, also test for tire and wheel runout and road force variation following the wheel balancer manufacturer's instructions and using the information listed in Tire And Wheel Balance. Refer to **STANDARD PROCEDURE**. Repeat the road test above to verify the vibration is repaired.

STANDARD PROCEDURE

TIRE AND WHEEL BALANCE

BACK CONE MOUNTING

FLANGE PLATE MOUNTING

CHROME/PLASTIC CLAD WHEEL SERVICE

FORCE MATCHING

NOTE: Always verify the wheel and tire balance before removing any wheel weights. If assembly is within specification and weights are not corroded or loose, do not remove weights. The process of removing and adding weight could damage wheel protective coating.

NOTE: Balance and road force variation equipment must be calibrated and maintained per equipment manufacturer's specifications.

NOTE: If a tire sealant & inflator kit was used to temporarily repair small punctures then the tire must be removed from wheel and all the sealant must be removed with a water damped cloth before repairing & balancing the assembly.

NOTE: Some wheels may not have an outer flange. Apply adhesive weights on midplane surface to balance.

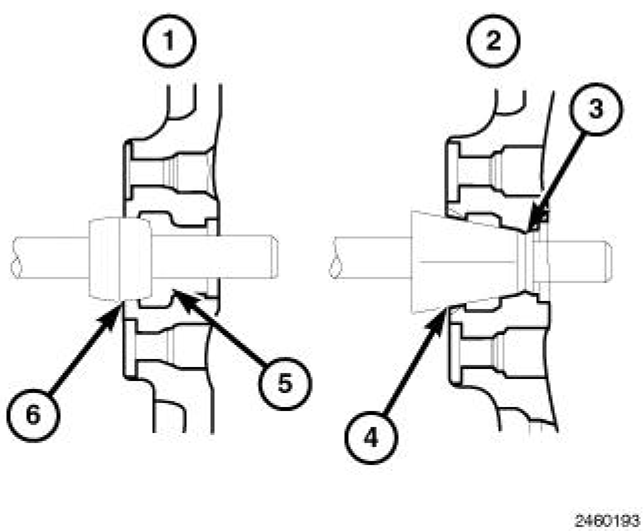

Fig. 1: Balancing Wheels Using Cone/Collet
Courtesy of CHRYSLER GROUP, LLC

NOTE: Use of the proper collet will prevent potential damage to the Chrome Clad wheels.

NOTE: Balance equipment could read an incorrect balance result when measuring Chrome Clad wheels. This is caused by the equipments mounting cone/collet contacting the cladding or the cone/collet is not balanced. A dual-taper collet (1) type wheel centering tool is recommended as opposed to a high-taper cone (2) type wheel centering tool. Always use the manufacturer's recommended

balance equipment.

- Dual-taper collet type (1)
- High-taper cone type (2)
- Possible obstruction (3)
- May not seat properly (4)
- No obstruction (5)
- Properly seated (6)

NOTE: If wheel balance equipment is capable of testing tire road force variation and the tire/wheel assemblies are within specification, place the tires with the greater road force variation on the rear of the vehicle.

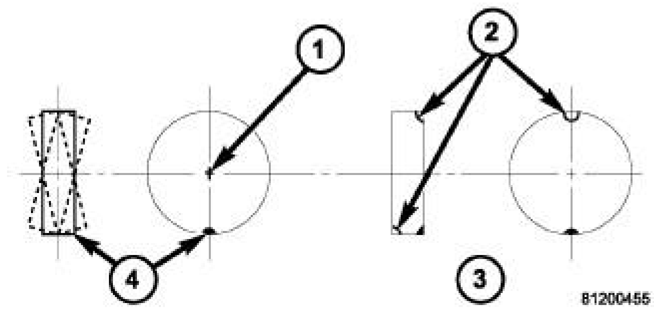

Fig. 2: Dynamic Balancing
Courtesy of CHRYSLER GROUP, LLC

For dynamic balancing (**recommended**), the balance equipment is designed to indicate the location and amount of weight to be applied to both the inner and outer rim flanges (2).

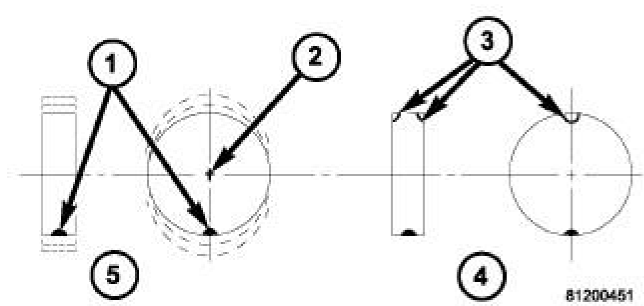

Fig. 3: Static Balancing

Courtesy of CHRYSLER GROUP, LLC

For static balancing (**not recommended**), find the location of the heavy spot causing the imbalance (1). Counter balance the wheel directly opposite the heavy spot. Determine weight required to counterbalance the area of imbalance. Place half of this weight on the **inner** rim flange and the other half on the **outer** rim flange (3) at the predetermined spots.

Aluminum wheels use a different type wheel weight than steel wheels. Be sure to use the correct wheel weight for the wheel type.

Always verify the balance. When using off-vehicle equipment, remount the tire and wheel assembly 180 degrees on the balancer spindle and recheck balance. Balance variation from one spot to the other should not be more than 0.125 (?) ounce. If variation is more than 0.125 ounce, balancing equipment could be malfunctioning, or the wrong collet/cone may have been used.

If difficult to balance, break down the tire and wheel assembly and check for loose debris inside the tire. Prior to disassembly, mark (index) the tire at the valve stem. Use this mark in order to remount the tire in its original orientation with respect to the wheel.

TIRE AND WHEEL ROTATION

The following information covers recommended tire rotation practices. For Tire And Wheel Removal and Installation procedures, refer to **INSTALLATION** and **REMOVAL**.

ALL-SEASON TIRE EQUIPPED

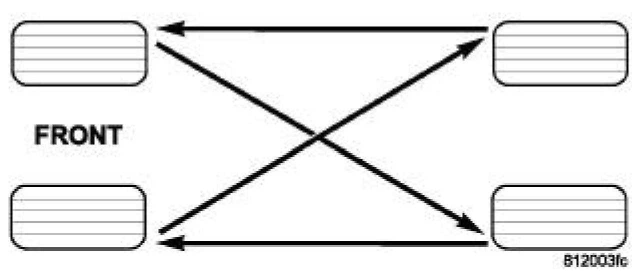

Fig. 4: Rotating Tires
Courtesy of CHRYSLER GROUP, LLC

This vehicle is equipped with All-Season tires (Standard) (Goodyear 245/45ZR20) or (Pirelli 275/40ZR20) use the suggested method of tire rotation that is shown in the graphic. Other rotation methods can be used, but they will not provide all the tire longevity benefits.

REMOVAL

TIRE AND WHEEL ASSEMBLY (ALUMINUM WHEEL)

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. If vehicle is equipped with wheel center caps covering wheel nuts, remove cap with appropriate removal tool utilizing notch formed into wheel near valve stem. Use care not to damage wheel coating.
3. Remove five wheel mounting (lug) nuts from studs.
4. Remove tire and wheel assembly from hub.

INSTALLATION

TIRE AND WHEEL ASSEMBLY (ALUMINUM WHEEL)

WARNING: **Installing wheels without good metal-to-metal contact with the mounting surface could cause loosening of the wheel mounting (lug) nuts. This could adversely affect the safety and handling of the vehicle.**

NOTE: **Never use oil or grease on studs or wheel mounting (lug) nuts.**

NOTE: **Clean wheel mounting surfaces, removing any build-up of corrosion. It is important to have good metal-to-metal contact between wheel and vehicle.**

1. Install the tire and wheel assembly on the hub and lightly snug all five wheel mounting (lug) nuts. **Do not tighten at this time.**
2. Progressively tighten wheel mounting (lug) nuts, in a star pattern, to the proper **WHEELS, SPECIFICATIONS**.
3. If applicable, install wheel center cap (4).
4. Remove the support and lower the vehicle.

TIRE PRESSURE MONITORING

DESCRIPTION

DESCRIPTION

The Tire Pressure Monitoring (TPM) system monitors air pressure in the four road tires (excludes spare). Pressure in the spare tire is not monitored.

There are two tire pressure monitoring systems available, a base system and a premium system. The base system does not specify how many tires are low or where they are located. The premium system does so.

Both TPM systems consist of tire pressure monitoring sensors attached to each road wheel through the valve stem mounting hole and a TPM module. The receiver circuit for the TPM system is mounted in the right rear wheel well. The TPM module is fixed to a metal bracket mounted to the inner wheel well located behind the splash shield. The TPM module decodes the RF signals transmitted by each of the vehicle's tire pressure sensors. The decoded information is used to determine if "warning" or "fault" conditions exist within the TPM system.

Upon detection of a warning or fault condition, the TPM module will send a request to the module that controls the indicator lamp and the text display via the vehicle bus system to illuminate or flash the indicator lamp. Also, upon detection of a warning or fault condition, the electronic display will send a request to sound the "chime".

The TPM module will store all warning and fault conditions, placard pressure values and low pressure threshold values (lamp ON and OFF) in memory that can be accessed through diagnostic communication. If new sensors are introduced to the vehicle, the data stored for the sensor being replaced will be deleted once the new sensor id has been learned.

The TPM module will store all wheel sensor ID's and locations and faults in memory that can be accessed through diagnostic communication.

The TPM module automatically learns and stores the sensor IDs while driving "within 20 minutes continuously above 24 km/h (15 mph)" after a sensor has been replaced. The learning sequence will initiate when the vehicle has been stopped for more than 20 minutes.

NOTE: A new sensor ID can also be programmed directly into the TPM module by using a RKE-TPM Analyzer in conjunction with a Scan Tool. Once the new sensor ID has been programmed, the vehicle will need to be driven above 15mph until the fault is no longer active (lamp extinguishes) and display is updated (for up to 20 minutes).

NOTE: Using a TPM-RKE Analyzer can take up to a minute to force a transmission from a sensor.

OPERATION

OPERATION

TIRE PRESSURE MONITORING

The Tire Pressure Monitoring (TPM) system is designed to operate without loss of function for all OEM tire construction for this vehicle. Sensors, mounted to each road wheel as part of the valve stem, transmit an RF signal indicating their individual pressure to a receiver located in the TPM module. These transmissions occur approximately once every minute at speeds over 15 mph (24 km/h). For more information on sensors, refer to SENSOR, TIRE PRESSURE MONITORING (TPM), OPERATION.

If the TPM module detects that the tire pressure in any road tire is going low, beyond the Low Pressure (lamp) ON threshold (see placard chart below), a chime will sound and the indicator lamp will turn on. In addition to the chime and lamp, a graphic display of the pressure value(s) and position of the low tire(s) will flash in the Electronic Vehicle Information Center (EVIC). Once pressure in the suspect tire(s) raises above the Low Pressure (lamp) OFF Threshold (see placard chart below), and the TPM module receives a valid transmission from the sensor, the lamp will go out. If a system fault is detected due to a missing sensor signal, in addition to a chime and a indicator lamp flashing, a "Check TPM System" text message will be displayed in the instrument cluster, and the tire pressure graphic display will have "- -" in place of the pressure value. After the flash sequence, the TPM indicator lamp will remain illuminated. The system will return to normal once the TPM module receives a valid transmission from that sensor location. If a system fault is detected, the indicator lamp will flash on/off for 75 seconds and then remain on solid.

If the TPM module detects a warning or fault condition at ignition key ON it will wait approximately ten seconds before sending the first request to illuminate the indicator lamp. This will assure that the display module has concluded its bulb check period. The display module will request a chime once per ignition cycle when a "warning" or "fault" condition is detected. A "warning" or "fault" condition will remain enabled until the problem causing the condition is corrected and reset.

The TPM module shall continuously monitor for the receipt of tire pressure RF message transmissions from the wheel sensors during the ignition key ON cycle. The wheel sensor IDs and the location of each sensor (e.g. Tire 1, Tire 2 etc.) are learned by the TPM control module using signal strength and direction of wheel rotation as received by the TPM module from each of the sensors, and updates the graphic display when necessary or

during a service procedure, as required.

The TPM System will continue to warn the driver of low tire pressure as long as the condition exists, and will not turn off the indicator lamp until the tire pressure is at or above the Low Pressure (lamp) OFF threshold (see placard chart below). The system will automatically update and the TPM indicator lamp will turn off once the updated tire pressures have been received.

Tire pressure will vary with temperature by about 1 psi (6.9 kPa) for every 12Ā°F (6.5Ā°C). This means that when the outside temperature decreases, the tire pressure will decrease. Tire pressure should always be set based on cold inflation tire pressure (placard pressure). This is defined as the tire pressure after a vehicle has not been driven for more than 3 hours (and in outside ambient temperature). The tire pressure will also increase as the vehicle is driven? this is normal and there should be no adjustment for this increased pressure. For a system fault, the system will return to normal once the TPM module receives a valid transmission from that sensor location.

TPM THRESHOLD PRESSURES

NOTE: **To determine the pressure thresholds for a vehicle, refer to the Tire Inflation Pressure (Placard) Label found on the Driver B-pillar, then apply the placard pressure to the following chart .**

Placard Pressure (Cold) (PSI)	Low Pressure ON Threshold (PSI)	Low Pressure OFF Threshold (PSI)
28	22	26
29	23	27
30	24	28
31	25	29
32	25	29
33	26	30
34	27	31
35	28	32
36	29	33
37	29	34
38	30	35
39	31	36
40	32	37
41	33	38
42	34	39
43	35	40
44	36	41
45	36	41
46	37	43
47	38	44
48	38	45
49	39	45

Placard Pressure (Cold) (PSI)	Low Pressure ON Threshold (PSI)	Low Pressure OFF Threshold (PSI)
50	40	47
51	41	48
55	44	52
60	48	57
65	52	62
70	56	67
75	60	72
80	64	77

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - TIRE PRESSURE MONITORING

When diagnosing a tire pressure issue, first check the Tire Pressure Monitoring (TPM) indicator lamp in the instrument cluster during ignition key ON. From the OFF position, turn the key to ON and check the TPM indicator lamp to observe one of the following:

- If after 10 seconds the indicator lamp is illuminating continuously (not flashing), proceed to **LOW PRESSURE**.
- If after 10 seconds the indicator lamp flashes on/off for 75 seconds, then remains on solid, there is a system fault detected. Proceed to SYSTEM FAULT below.

LOW PRESSURE

NOTE: **Tire pressure may increase from 2 to 6 psi (14 to 41 kPa) during normal driving conditions. Do NOT reduce this normal pressure build up.**

NOTE: **Tire pressure will vary with temperature by about 1 psi (6.9 kPa) for every 12Â°F (6.5Â°C). This means that when the outside temperature decreases, the tire pressure will also decrease. Tire pressure should always be set based on cold inflation tire pressure. For details, refer to TIRES, STANDARD PROCEDURE.**

Check air pressure as necessary in all tires using a known accurate air gauge and adjust to the specification listed on the Tire Inflation Pressure Label (Placard) provided with the vehicle (usually applied to the driver side B-pillar). After adjusting air pressure in a tire on the vehicle, the vehicle needs to be driven for approximately two minutes above 15 mph for the message or indicator lamp to go out.

If air pressure in any tire is low, inspect **all** the tires for leaks. A water "dunk tank" or other water test may be used to check for a leak around the sensor as long as any water at the valve core is removed once the procedure is completed. The water can be easily expelled from the core area by pushing in on the core for several seconds, allowing escaping air to drive out any moisture. Reinflate the tire as necessary. Always make sure the original (special) valve stem cap is securely installed to keep moisture out of the sensor.

If the indicator lamp is still ON continuously, refer to the appropriate diagnostic information.

SYSTEM FAULT

If a system fault is detected, a chime will sound, and the TPM indicator (telltale) lamp will flash for 75 seconds, then remain on solid. For vehicles with the Premium TPM Systems, a "CHECK TPM SYSTEM" message will appear in the Electronic Vehicle Information Center (EVIC), followed by a graphic display. A system fault can occur by many reasons, including the following:

- Signal interference due to electronic devices or driving next to facilities emitting the same radio frequencies as the TPM sensors
- Installing some form of aftermarket window tinting that affects radio wave signals
- Accumulation of snow or ice around the wheels or wheel housings
- Using tire chains on the vehicle
- Using wheels not equipped with TPM sensors

Refer to the appropriate diagnostic information.

SENSOR, TIRE PRESSURE MONITORING (TPM)

CAUTION

CAUTION

CAUTION:	**The use of tire sealants is not recommended for vehicles equipped with the Tire Pressure Monitoring system. Tire sealants may clog tire pressure sensors.**
CAUTION:	**Tire pressure sensor valve stem caps and cores are specially designed for the sensors. Due to risk of corrosion, do not use a standard valve stem cap or core in a tire pressure sensor in place of the original equipment style sensor cap and core.**
CAUTION:	**It is not recommended to install a tire pressure sensor in an aftermarket wheel. Use tire pressure sensors in original style factory wheels only.**
CAUTION:	**Any time a sensor is to be reinstalled in a wheel, a new valve stem assembly must be installed to ensure air tight sealing.**
NOTE:	**TPM thresholds have been established for the original tire size equipped on the vehicle. Use original size tires only to maintain system accuracy.**

DESCRIPTION

NON SRT8

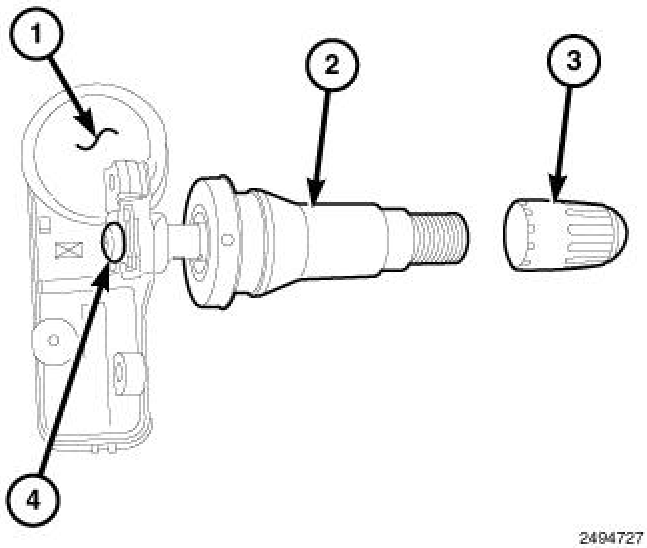

Fig. 5: Tire Pressure Monitoring Sensor Components
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Replace the valve stem assembly and tire pressure sensor mounting screw with each tire change.**

One tire pressure sensor (1) is mounted to a valve stem (2) specifically designed for mounting the pressure sensor (1) in each wheel in place of the traditional tire valve stem. Each sensor has an internal battery that lasts up to 10 years. The battery is not serviceable. At the time of battery failure, the sensor (1) must be replaced. The TPM system operates on a 433 MHz radio frequency. The tire pressure sensor valve stem (2) looks similar to a standard valve stem with the tire mounted on the wheel. To visually identify a tire pressure sensor/valve stem, the valve stem cap (3) is longer than a standard valve stem.

NOTE: **This vehicle uses the 433 MHz TPM sensor. Although 315 MHz and 433 MHz sensors are identical in size and shape, they are not interchangeable. Always make sure the correct sensor is being used. A RKE-TPM Analyzer can be used to determine the sensor's frequency without having to dismount the tire.**

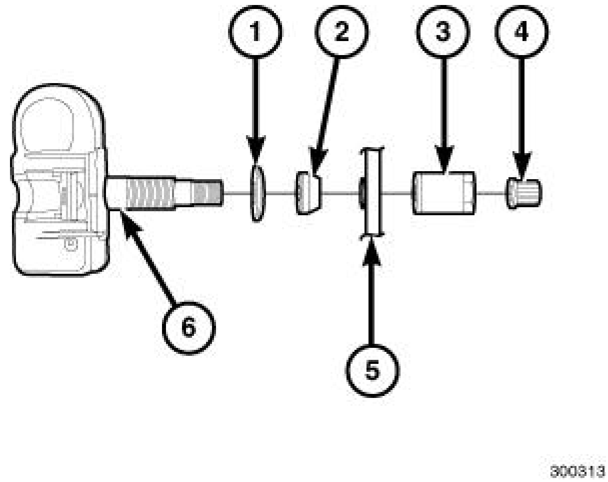
The TPM sensors are designed for original style factory wheels. It is not recommended to install a tire pressure sensor in an aftermarket wheel. This could cause sealing and system performance issues.

The serviceable components of the tire pressure sensor are:

- Tire pressure sensor (1), including all components below
- Valve stem (2), including screw (4), core, and cap (3)
- Valve stem core (not shown)
- Valve stem cap (3)

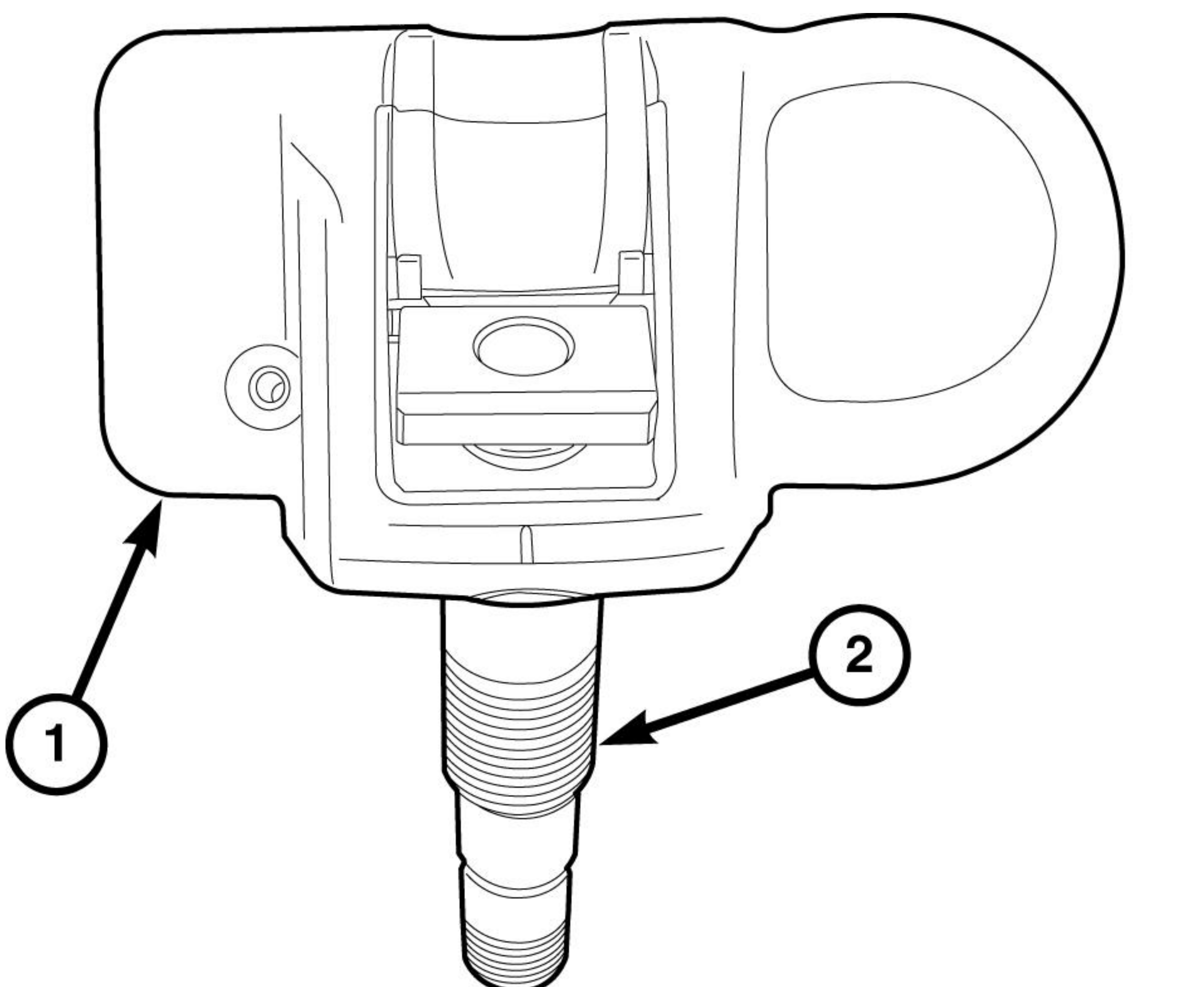
The valve stem caps and cores used are specifically designed for the tire pressure monitoring sensors. Although similar to standard valve stem caps and cores, they are different. The valve stem cap has a special seal inside to keep moisture and corrosion out. The valve stem core has a special nickel coating to protect from corrosion.

SRT8



[Fig. 6: Sensor Mounting - Exploded View](#)
Courtesy of CHRYSLER GROUP, LLC

On vehicles equipped with Tire Pressure Monitoring (TPM), one tire pressure sensor (6) is mounted to each wheel in place of the traditional tire valve stem. Each sensor has an internal battery that lasts up to 10 years. The battery is not serviceable. At the time of battery failure, the sensor must be replaced.



[Fig. 7: Tire Pressure Monitoring Sensor](#)
Courtesy of CHRYSLER GROUP, LLC

The TPM system operates on a 433 MHz radio frequency. The 433 MHz sensors (1) can be easily identified by the part number.

CAUTION: Although additional sensors operating at 433 MHz sensors are available and are used in other applications, they are not interchangeable. Always make sure the correct sensor is being used and be sure to replace the sensor with the correct part number.

NOTE: Once mounted inside a tire and wheel assembly you are not able to visually see the difference between this sensor and other 315 MHz and 433 MHz sensors. At that point, the TPM/RKE Analyzer 9936, with the Scan Tool may be used to identify the sensor frequency or the tire can be dismounted allowing visual inspection of the sensor body and part number.

The TPM sensors are designed for original style factory wheels. It is not recommended to install a tire pressure sensor in an aftermarket wheel (This could cause sealing and system performance issues). **Do not attempt to install a tire pressure sensor in an aftermarket wheel. If aftermarket wheels are installed and do not contain tire pressure sensors, the system will not function properly and the driver will be continuously notified of a system malfunction.**

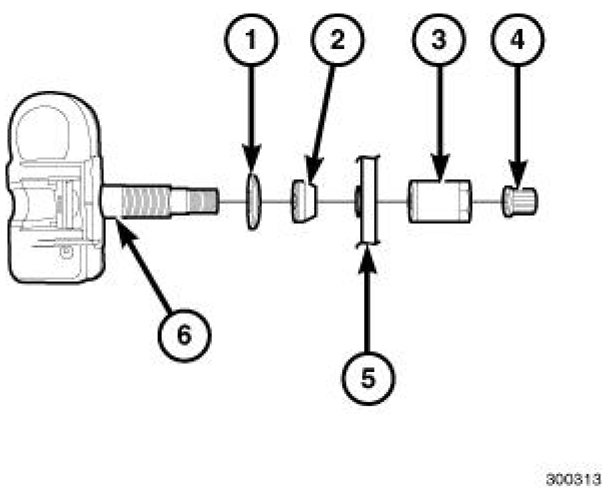


Fig. 8: Sensor Mounting - Exploded View
Courtesy of CHRYSLER GROUP, LLC

1 - METAL WASHER
2 - SEAL
3 - NUT (WITH PRESSED-IN WASHER)
4 - CAP (WITH SEAL)
5 - SECTIONAL CUTAWAY OF WHEEL
6 - TPM SENSOR

The serviceable components of the tire pressure sensor are:

- Sensor-To-Wheel Seal (2) and Metal Washer (1)
- Valve Stem Cap (4)
- Valve Stem Core

- Valve Stem Nut (with pressed-in washer) (3)

NOTE: **Any time a sensor is installed on a wheel, a new Sensor-To-Wheel Seal (2), Metal Washer (1) and Valve Stem Nut (3) must be installed to ensure air tight sealing. A service kit is available.**

The valve stem caps and cores are specifically designed for the tire pressure monitoring sensors. Although similar to standard valve stem caps and cores, they are different. The valve stem cap has a special seal inside to keep moisture and corrosion out. The valve stem core has a special nickel coating to protect from corrosion.

OPERATION

OPERATION

CAUTION: **The TPMS has been optimized for the original equipment tires and wheels. TPMS pressures have been established for the tire size equipped on your vehicle. Undesirable system operation or sensor damage may result when using replacement equipment that is not of the same size, type, and/or style. After-market wheels can cause sensor damage. Do not use aftermarket tire sealants or balance beads if your vehicle is equipped with a TPMS, as damage to the sensors may result.**

CAUTION: **After inspecting or adjusting the tire pressure always reinstall the valve stem cap. This will prevent moisture and dirt from entering the valve stem, which could damage the Tire Pressure Monitoring Sensor.**

CAUTION: **Tire pressure sensor valve stem caps and cores are specially designed for the sensors. Due to risk of corrosion, do not use a standard valve stem cap or core in a tire pressure sensor in place of the original equipment style sensor cap and core.**

CAUTION: **Any time a sensor is to be reinstalled in a wheel, a new valve stem assembly must be installed to ensure air tight sealing.**

NOTE: **TPM thresholds have been established for the original tire size equipped on the vehicle. Use original size tires only to maintain system accuracy.**

The battery operated tire pressure sensor is both a transmitter and a receiver. The TPM sensor can be forced to transmit if using a special tool such as a TPM-RKE Analyzer. The TPM-RKE Analyzer has the ability to change the sensor mode and to diagnose a faulty TPM sensor. Using a TPM-RKE Analyzer can take up to a minute to force a transmission from a sensor.

Each sensor's (transmitter) broadcast is uniquely coded so that the module can monitor the state of each of the sensors on the four rotating road wheels. The module can automatically learn and store the sensor's ID while driving "within 10 minutes continuously above 24 km/h (15 mph)" after a sensor has been replaced. The vehicle must be stationary for more then 20 minutes in order to initiate the learning sequence.

The sensor IDs can also be programmed using the TPM-RKE Analyzer Tool. Scan each TPM sensor at each road wheel, and store each Sensor ID in the correct location. (LEFT FRONT, LEFT REAR, RIGHT FRONT,

and RIGHT REAR) Connect the TPM-RKE Analyzer Tool to the Scan Tool. Then follow the programming steps outlined in the diagnostic Scan Tool for "Program Tire Pressure Sensor ID w/ TPM Tool".

REMOVAL

NON SRT8

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove tire and wheel assembly.

CAUTION: The cap used on this valve stem contains an O-ring seal to prevent contamination and moisture from entering the valve stem. Do not substitute a regular valve stem cap in its place.

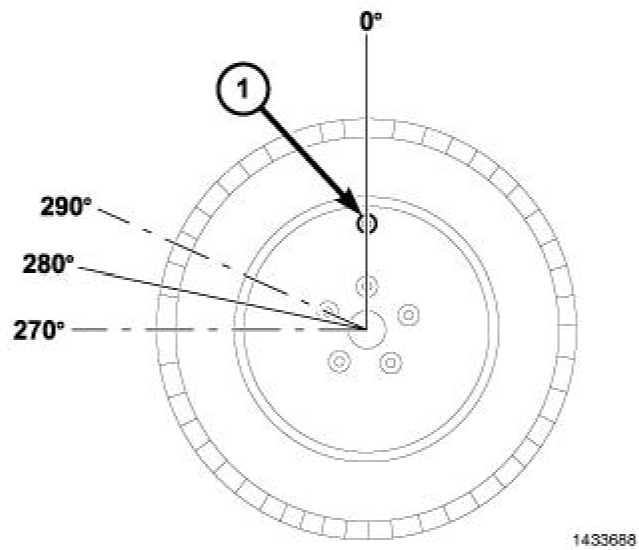

Fig. 9: Start Mount/Dismount Tool Within 10 Degrees Of Valve Stem
Courtesy of CHRYSLER GROUP, LLC

3. Dismount tire from wheel following tire changer manufacturers instructions while paying special attention to the following to avoid damaging the pressure sensor:
   a. When breaking the tire bead loose from the wheel rim, avoid using the Bead Breaker in the area of the sensor (1). That includes both outer and inner beads of the tire.
   b. When preparing to dismount the tire from the wheel, carefully insert the mounting/dismounting tool 280Â° from the valve stem Â± 10Â°, then proceed to dismount the tire from the wheel. Use this process on both outer and inner tire beads.

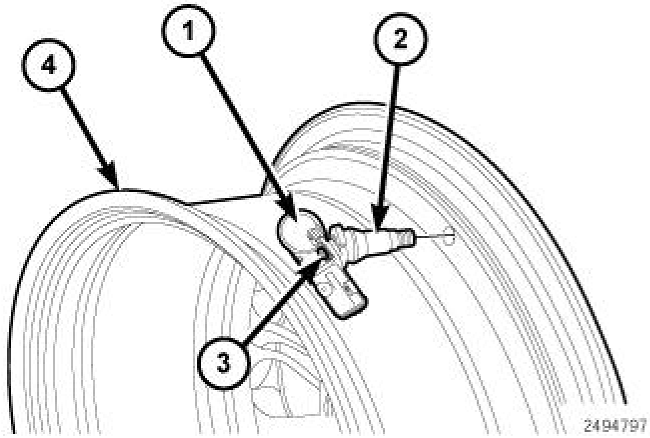

Fig. 10: Sensor Mounting To Wheel
Courtesy of CHRYSLER GROUP, LLC

4. Remove the sensor to valve stem retainer screw (3) and remove the sensor (1) from the valve stem (2).
5. Remove the valve stem (2) from the wheel (4).

SRT8

1. Raise and support vehicle.
2. Remove tire and wheel assembly.

CAUTION:	**The cap used on this valve stem contains an O-ring seal to prevent contamination and moisture from entering the valve stem. Do not substitute a regular valve stem cap in its place.**
CAUTION:	**The valve stem used on this vehicle is made of aluminum and the core is nickel plated brass. The original valve stem core must be reinstalled and not substituted with a valve stem core made of a different material. This is required to prevent corrosion in the valve stem caused by the different metals.**

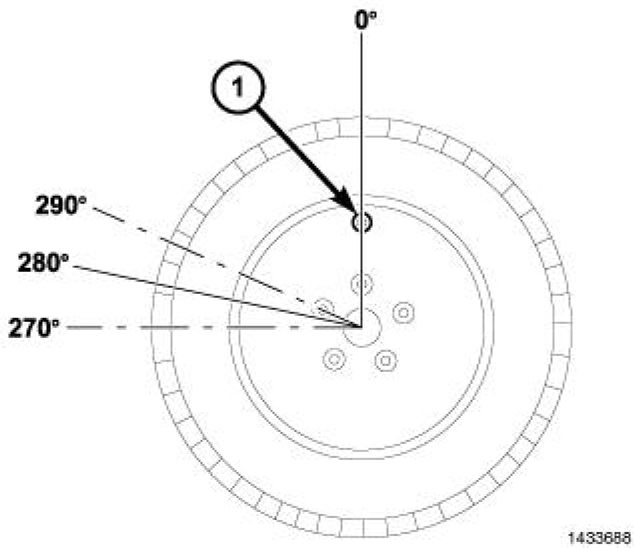

Fig. 11: Start Mount/Dismount Tool Within 10 Degrees Of Valve Stem
Courtesy of CHRYSLER GROUP, LLC

3. Dismount tire from wheel following tire changer manufacturers instructions while paying special attention to the following to avoid damaging the pressure sensor:
    a. When breaking the tire bead loose from the wheel rim, avoid using the Bead Breaker in the area of the sensor (1). That includes both outer and inner beads of the tire.
    b. When preparing to dismount the tire from the wheel, carefully insert the mounting/dismounting tool 280Â° from the valve stem Â± 10Â°, then proceed to dismount the tire from the wheel. Use this process on both outer and inner tire beads.

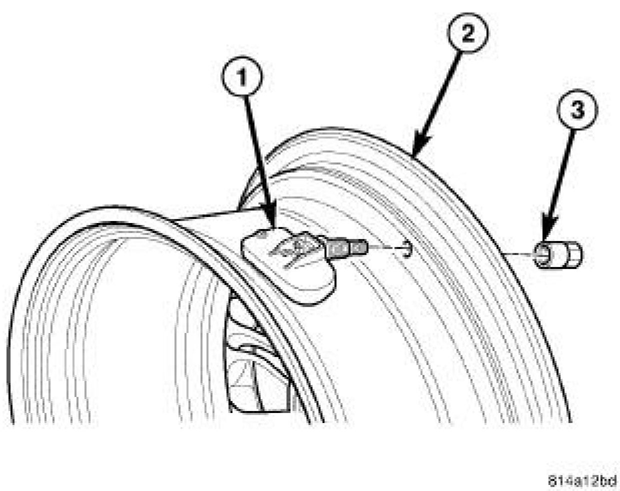

Fig. 12: Sensor Mounting To Wheel
Courtesy of CHRYSLER GROUP, LLC

4. Remove sensor nut (3) retaining sensor to wheel. While removing nut, hold pressure against rear of metal valve stem to keep valve stem from pushing rearward, damaging antenna strap.
5. Remove sensor (1) from wheel (2).

INSTALLATION

NON SRT8

NOTE: **If replacing tire pressure sensor, a new valve stem will be pre-mounted to the sensor as an assembly. Verify that the sensor is positioned properly before seating the valve stem. If replacing a valve stem only (using the existing tire pressure sensor), the new valve stem will include a new tire pressure sensor mounting screw. Always use a new mounting screw when attaching a sensor to a valve stem.**

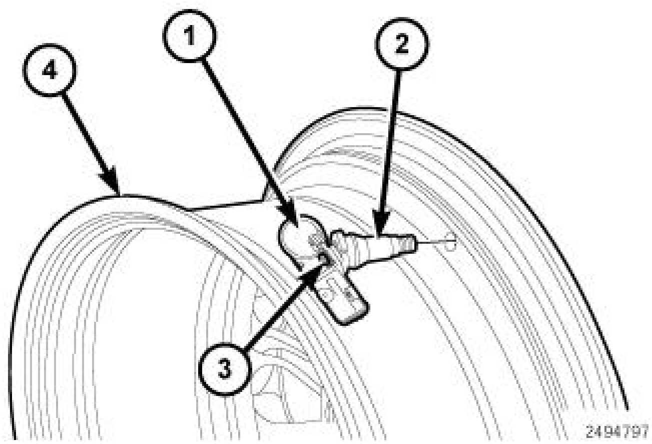

Fig. 13: Sensor Mounting To Wheel
Courtesy of CHRYSLER GROUP, LLC

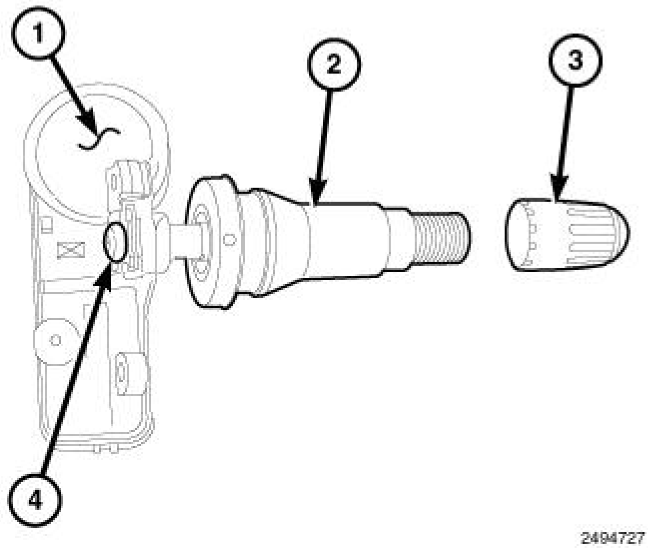
CAUTION: **Any time a sensor is to be reinstalled in a wheel, a new valve stem assembly must be installed to ensure air tight sealing.**

1. Wipe area clean around sensor/valve stem mounting hole in wheel (4). Make sure surface of wheel is not damaged.

   NOTE: **A new valve stem is pre-lubricated for proper installation with a standard tool.**

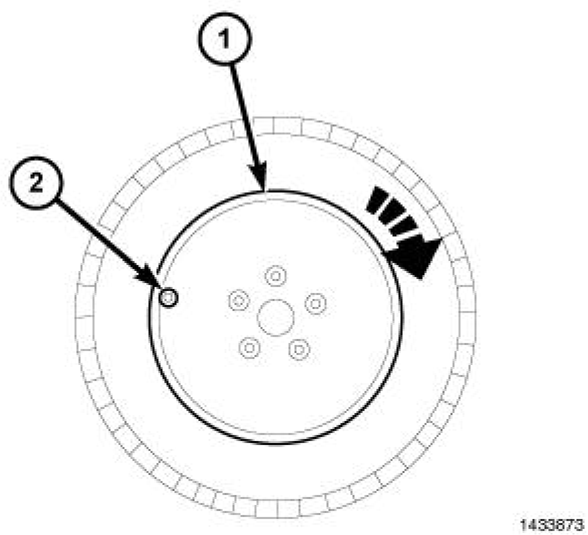
   NOTE: **If replacing tire pressure sensor, a new valve stem will be pre-mounted to the sensor as an assembly. Verify that the sensor is positioned properly before seating the valve stem.**

2. Insert valve stem (2) through wheel (4) and pull through to seat with standard valve stem installation tool.



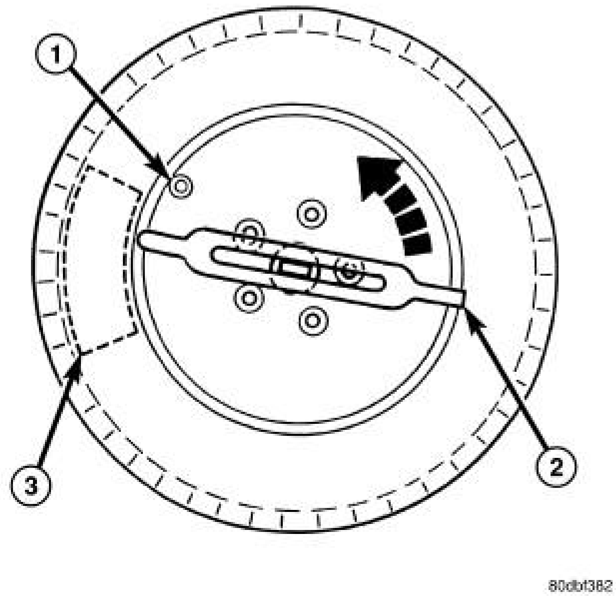
[Fig. 14: Tire Pressure Monitoring Sensor Components](#)
Courtesy of CHRYSLER GROUP, LLC

3. If replacing the valve stem (2) only (using the existing tire pressure sensor), verify that the flat sides of the brass extension on the bottom of the valve stem (2) are at a 90 degree angle with the wheel. Position the pressure sensor (1) over the brass extension, install the retainer screw (4).
4. Mount tire on wheel following tire changer manufacturers instructions, paying special attention to the following to avoid damaging tire pressure sensor:



[Fig. 15: Mounting Tire Using Rotating Wheel Machine](#)
Courtesy of CHRYSLER GROUP, LLC

a. Rotating Wheel Tire Changers - Once the wheel is mounted to the changer, position the sensor valve stem (2) approximately 280Â° from the head of the changer (located at 1) in a clockwise direction before rotating the wheel (also in a clockwise direction) to mount the tire. Use this procedure on both the outer and inner tire beads.



[Fig. 16: Mounting Tire Using Rotating Tool Machine](#)
Courtesy of CHRYSLER GROUP, LLC

b. Rotating Tool Tire Changers - Position the wheel on the changer so that the sensor valve stem (1) is located approximately 210Â° clockwise from the installation end of the mounting/dismounting tool (2) once the tool is mounted for tire installation. Make sure the sensor is clear of the lower bead breaker area (3) to avoid damaging the sensor when the breaker rises. Rotate the tool (2) in a counterclockwise direction to mount the tire. Use this procedure on both the outer and inner tire beads.
c. Adjust air pressure to that listed on Tire Inflation Pressure Label (Placard) provided with vehicle (usually applied to driver's side B-pillar). Make sure **original style** valve stem cap is securely installed to keep moisture out of sensor.
d. Install tire and wheel assembly on the vehicle.
e. Remove the support and lower the vehicle.
f. Perform one of the following to make the system learn the new sensor ID.
g. Using the TPM-RKE Analyzer 9936 with the Scan Tool, program the TPM Module with the new tire pressure sensor ID. This is part of the TPM Diagnostic Verification Test. Refer to **STANDARD PROCEDURE** .
h. The vehicle should remain stationary for at least 20 minutes. Drive the vehicle for a minimum of 20 minutes while maintaining a continuous speed above 24 km/h (15 mph). During this time, the system will recognize and add the new sensor ID. This is part of the TPM Diagnostic Verification Test. Refer to **STANDARD PROCEDURE** .

NOTE: **If a sensor cannot be trained, refer to appropriate diagnostic information.**

SRT8

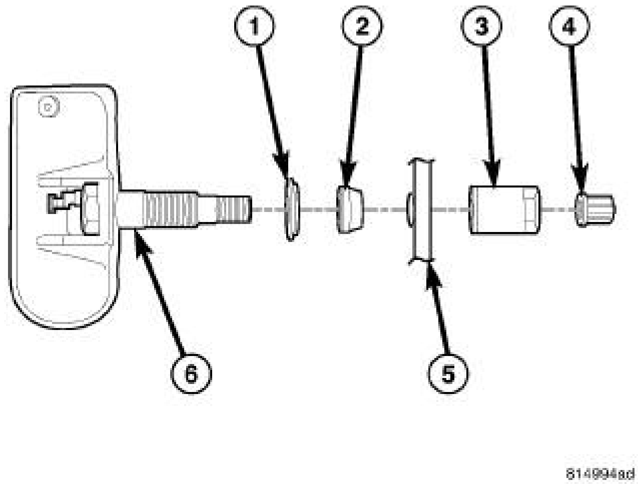


Fig. 17: Sensor Mounting - Exploded View
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Before reinstalling an existing tire pressure sensor, replace seal (2) and metal washer (1) at base of sensor valve stem (6) to ensure proper sealing.**

1. Wipe area clean around sensor/valve stem mounting hole in wheel (5). Make sure surface of wheel is not damaged.

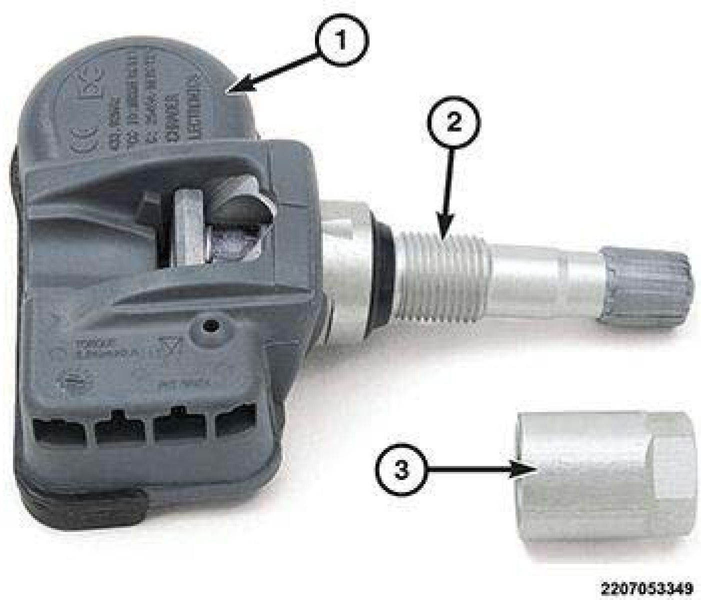

Fig. 18: Sensor Antenna Strap, Valve Stem & Valve Cap
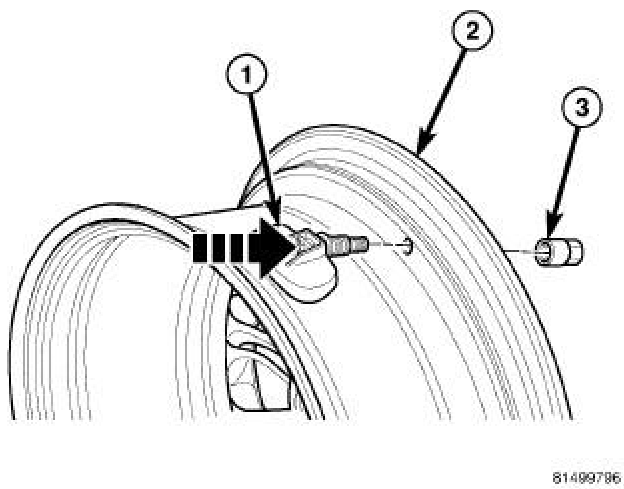
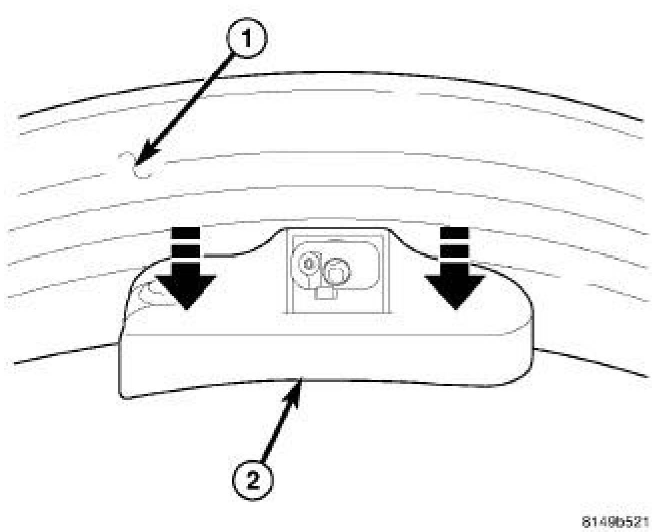
Courtesy of CHRYSLER GROUP, LLC

CAUTION: **To avoid damaging sensor antenna strap (1), if equipped, hold pressure against rear of metal valve stem (2) while sensor is inserted through wheel mounting hole and nut is installed.**



[Fig. 19: Installing Sensor To Wheel](#)
Courtesy of CHRYSLER GROUP, LLC

2. Insert sensor (1) through wheel (2) as shown keeping pressure against rear of metal valve stem (See Arrow). Potted side of sensor is to be positioned toward wheel. Do not attempt to mount sensor otherwise, damage may occur.
3. Install sensor nut (with pressed-in washer) (3) by hand.



[Fig. 20: Seat Sensor Against Wheel Interior](#)
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Over-torquing the sensor nut by as little as 12 N.m (106 in. lbs.) may result in sensor separation from the valve stem. Under this condition, the sensor may still function. However, the condition should be corrected immediately.

NOTE: **Before tightening sensor nut, push downward on sensor housing (2) in an attempt to make it flush with interior contour of wheel (1).**

4. While holding sensor in position, tighten sensor nut to the proper **SPECIFICATIONS**.
5. Mount tire on wheel following tire changer manufacturers instructions, paying special attention to the following to avoid damaging tire pressure sensor:

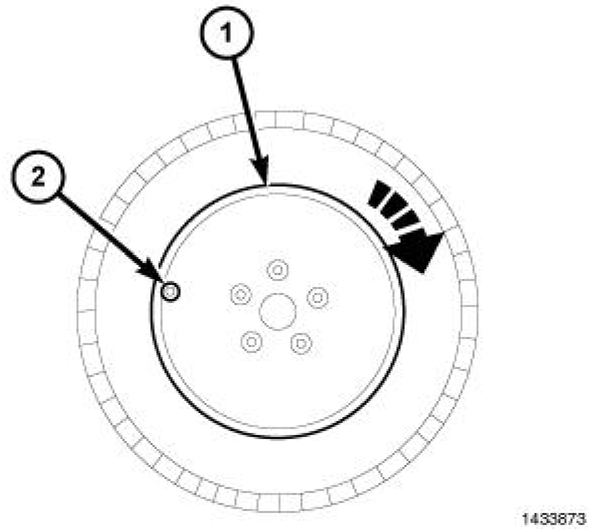


Fig. 21: Mounting Tire Using Rotating Wheel Machine
Courtesy of CHRYSLER GROUP, LLC

a. Rotating Wheel Tire Changers - Once the wheel is mounted to the changer, position the sensor valve stem (2) approximately 280Â° from the head of the changer (located at 1) in a clockwise direction before rotating the wheel (also in a clockwise direction) to mount the tire. Use this procedure on both the outer and inner tire beads.

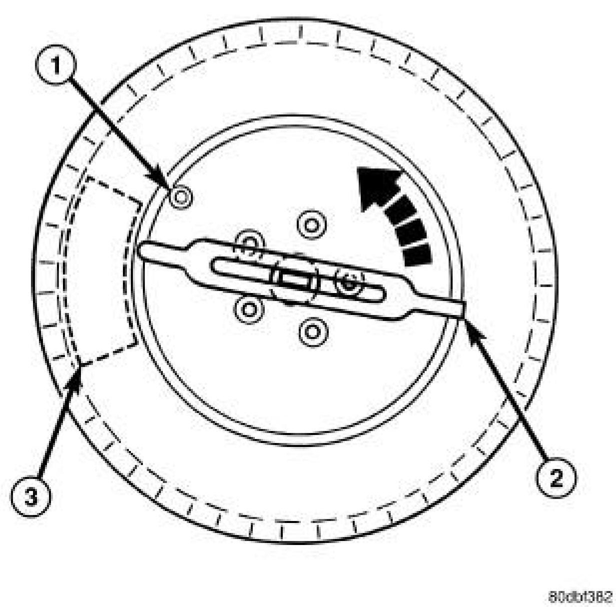

Fig. 22: Mounting Tire Using Rotating Tool Machine
Courtesy of CHRYSLER GROUP, LLC

b. Rotating Tool Tire Changers - Position the wheel on the changer so that the sensor valve stem (1) is located approximately 210Â° clockwise from the installation end of the mounting/dismounting tool (2) once the tool is mounted for tire installation. Make sure the sensor is clear of the lower bead breaker area (3) to avoid damaging the sensor when the breaker rises. Rotate the tool (2) in a counterclockwise direction to mount the tire. Use this procedure on both the outer and inner tire beads.
c. Adjust air pressure to that listed on Tire Inflation Pressure Label (Placard) provided with vehicle (usually applied to driver's side B-pillar). Make sure **original style** valve stem cap is securely installed to keep moisture out of sensor.
d. Install tire and wheel assembly on vehicle.
e. Remove the support and lower the vehicle.
f. Perform one of the following to make the system learn the new sensor ID.
g. Using the TPM-RKE Analyzer 9936 with the Scan Tool, program the TPM Module with the new tire pressure sensor ID. This is part of the TPM Diagnostic Verification Test. Refer to **STANDARD PROCEDURE** .
h. The vehicle should remain stationary for at least 20 minutes. Drive the vehicle for a minimum of 20 minutes while maintaining a continuous speed above 24 km/h (15 mph). During this time, the system will recognize and add the new sensor ID. This is part of the TPM Diagnostic Verification Test. Refer to **STANDARD PROCEDURE** .

NOTE: **If a sensor cannot be trained, refer to appropriate diagnostic information.**

TIRES

DESCRIPTION

TIRE

Original Equipment tires are designed to complement the ride and handling characteristics of a specific vehicle. They provide the best overall performance for normal operation because they have been matched to the vehicle's requirements. With proper care, these tires will provide excellent ride, handling, traction, tread life, and durability performance.

Driving habits affect tire life more than any other factor. Tires will generally last much longer when operated by a careful driver rather than with severe use by a careless driver. Here are some driving habits that will shorten the life of any tire:

- Rapid acceleration
- Severe brake application
- High-speed driving
- Corning at excessive speeds
- Striking the tires against curbs or other obstacles
- Operating a vehicle with tires that are under inflated or over inflated

Radial ply tires are susceptible to irregular tread wear. To achieve maximum tire tread life, it is important to follow the rotation interval shown in **TIRE AND WHEEL ROTATION**.

TIRE IDENTIFICATION

The size, type, load index, speed rating, and other important information about the tire are molded on its sidewalls. Refer to **Fig. 23** for an explanation of the tire markings.

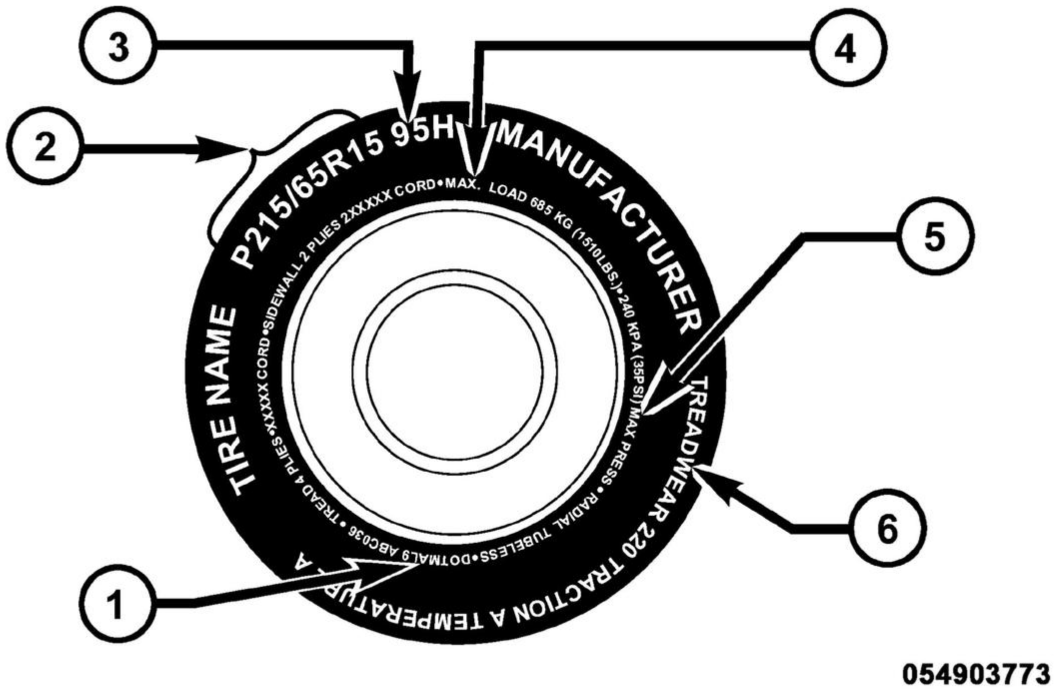

Fig. 23: Tire Identification
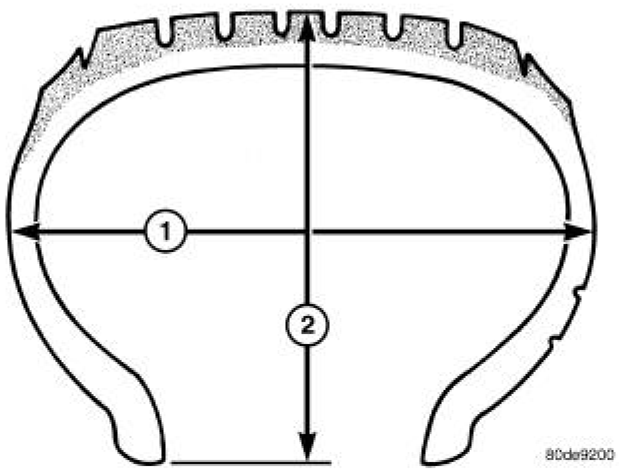
Courtesy of CHRYSLER GROUP, LLC

1 - U.S. DOT Safety Standards Code (TIN)
4 - Maximum Load
2 - Size Designation
5 - Maximum Pressure
3 - Service Description
6 - Treadwear, Traction and Temperature Grades

NOTE:

- **P (Passenger) - Metric tire sizing is based on U.S. design standards. P-Metric tires have the letter "P" molded into the sidewall preceding the size designation. Example: P215/65R15 95H.**
- **European - Metric tire sizing is based on European design standards. Tires designed to this standard have the tire size molded into the sidewall beginning with the section width. The letter "P" is absent from this tire size designation. Example: 215/65R15 96H.**
- **LT (Light Truck) - Metric tire sizing is based on U.S. design standards. The size designation for LT-Metric tires is the same as for P-Metric tires except for the letters "LT" that are molded into the sidewall preceding the size designation. Example: LT235/85R16.**

- **Temporary spare tires are designed for temporary emergency use only. Temporary high pressure compact spare tires have the letter "T" or "S" molded into the sidewall preceding the size designation. Example: T145/80D18 103M.**
- **High flotation tire sizing is based on U.S. design standards and it begins with the tire diameter molded into the sidewall. Example: 31x10.5 R15 LT.**



[Fig. 24: Tire Aspect Ratio]
Courtesy of CHRYSLER GROUP, LLC

1- SECTION WIDTH
2- SECTION HEIGHT

NOTE: **Aspect Ratio = Section Height (2) Ć· Section Width (1) x 100%**

TIRE SIZING CHART

EXAMPLE:		
Example Size Designation: P215/65R15XL 95H, 215/65R15 96H, LT235/85R16C, T145/80D18 103M, 31x10.5 R15 LT		
Ā	**P** = Passenger car tire size based on U.S. design standards, or	
Ā	**"..blank.."** = Passenger car tire based on European design standards, or	
Ā	**LT** = Light truck tire based on U.S. design standards, or	
Ā	**T or S** = Temporary spare tire or	
Ā	**31** = Overall diameter in inches (in)	
Ā	**215, 235, 145** = Section width in millimeters (mm)	
Ā	**65, 85, 80** = Aspect ratio in percent (%)	
Ā	Ā	- Ratio of section height to section width of tire, or
Ā	**10.5** = Section width in inches (in)	
Ā	**R** = Construction code	
Ā	Ā	- "R" means radial construction, or
Ā	Ā	- "D" means diagonal or bias construction

EXAMPLE:		
Ā	**15, 16, 18** = Rim diameter in inches (in)	
Service Description:		
Ā	**95** = Load Index	
Ā	Ā	- A numerical code associated with the maximum load a tire can carry
Ā	**H** = Speed Symbol	
Ā	Ā	- A symbol indicating the range of speeds at which a tire can carry a load corresponding to its load index under certain operating conditions
Ā	Ā	- The maximum speed corresponding to the speed symbol should only be achieved under specified operating conditions (i.e., tire pressure, vehicle loading, road conditions, and posted speed limits)
Load Identification: Absence of the following load identification symbols on the sidewall of the tire indicates a Standard Load (SL) tire: • **XL** = Extra load (or reinforced) tire, or • **LL** = Light load tire or • **C, D, E, F, G** = Load range associated with the maximum load a tire can carry at a specified pressure		
Maximum Load - Maximum load indicates the maximum load this tire is designed to carry		
Maximum Pressure - Maximum pressure indicates the maximum permissible cold tire inflation pressure for this tire		

TIRE IDENTIFICATION NUMBER (TIN)

EXAMPLE:	
DOT MA L9 ABCD 0301	
DOT = Department of Transportation	
Ā	- This symbol certifies that the tire is in compliance with the U.S. Department of Transportation tire safety standards and is approved for highway use
MA = Code representing the tire manufacturing location (two digits)	
L9 = Code representing the tire size (two digits)	
ABCD = Code used by the tire manufacturer (one to four digits)	
03 = Number representing the week in which the tire was manufactured (two digits)	
Ā	- 03 means the 3rd week
01 = Number representing the year in which the tire was manufactured (two digits)	
Ā	- 01 means the year 2001
Ā	- Prior to July 2000, tire manufacturers were only required to have one number to represent the year in which the tire was manufactured. Example: 031 could represent the 3rd week of 1981 or 1991

TIRE - SRT8

There is no spare tire available with this vehicle. It is equipped with the TIREFIT tire repair kit to be used to

repair small punctures in the tire as necessary. For additional information, refer to the Owners Manual.

NOTE: **The All-Season and SRT8 Hellcat tire and wheel combination may be rotated. Refer to STANDARD PROCEDURE.**

Size	275/40ZR20	275/40ZR20

REPLACEMENT TIRES

WARNING: **Failure to equip the vehicle with tires having adequate speed capability can result in sudden tire failure.**

WARNING: **In order to maintain the speed capability of the vehicle, replacement tires must have speed ratings equal to or higher than those fitted to the vehicle as original equipment. If tires with lower speed ratings are fitted, the vehicle's handling may be affected and the speed capability of the vehicle may be lowered to the maximum speed capability of the replacement tires. To avoid an accident resulting in severe or fatal injury, consult the tire manufacturer in regards to maximum speed ratings.**

It is recommended that tires equivalent to the original equipment tires be used when replacement is needed.

Failure to use equivalent replacement tires may adversely affect the safety and handling of the vehicle.

The original equipment tires provide a proper combination of many characteristics such as:

- Ride
- Noise
- Handling
- Durability
- Tread life
- Traction
- Rolling resistance
- Speed capability

The use of tires smaller than the minimum tire size approved for the vehicle can result in tire overloading and

failure.

Use tires that have the approved load rating for the vehicle and never overload them. Failure to equip the vehicle with tires having adequate speed capability can result in sudden tire failure and loss of vehicle control.

The use of oversize tires may cause interference with vehicle components. Under extremes of suspension and steering travel, interference with vehicle components may cause tire damage.

SPARE TIRE

A compact (temporary) spare tire and wheel assembly is standard equipment on most models of this vehicle. A full-size spare is not available on most models.

SRT vehicles and select Export vehicles are equipped with the TIREFIT tire repair kit as standard equipment in place of a spare tire. It is to be used to repair small punctures in the tire as necessary. For additional information, refer to the Owners Manual.

The spare tire and wheel diameters and wheel offsets match those of the road wheels on the vehicle.

The compact (temporary) spare tire is designed for emergency use only. The original tire should be repaired or replaced at the first opportunity, then reinstalled. Do not exceed speeds of 80 km/h (50 mph) when using the compact (temporary) spare tire and wheel assembly. Refer to the Owner's Manual for complete details.

DIAGNOSIS AND TESTING

TIRE NOISE

Unusual tire noise can be associated with tire and wheel vibration or irregular tire wear. For vibration issues, refer to **DIAGNOSIS AND TESTING**. For irregular tire wear issues, refer to **TIRES, DIAGNOSIS AND TESTING**.

TIRE/VEHICLE LEAD

Refer to **WHEEL ALIGNMENT, DIAGNOSIS AND TESTING** .

TIRE WEAR PATTERNS

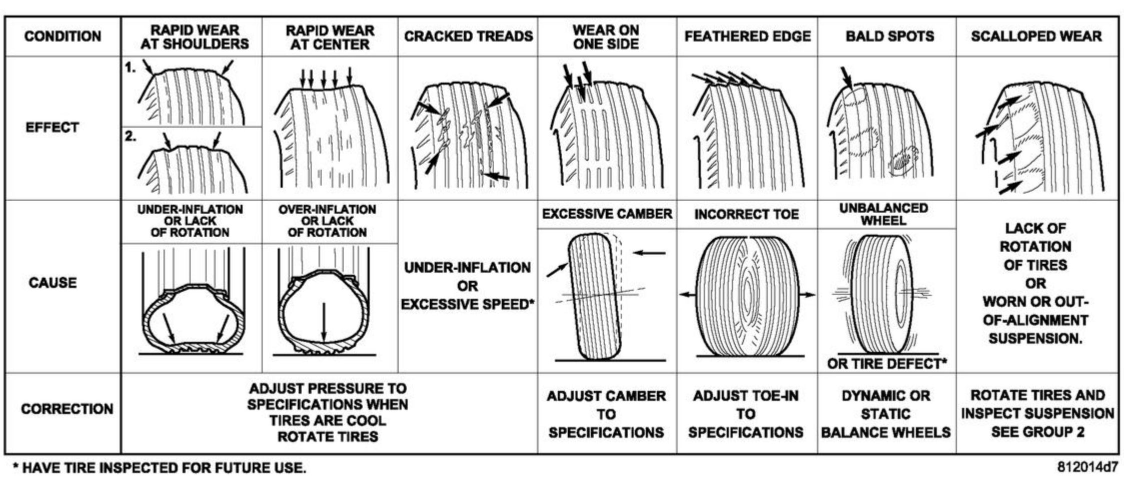

Fig. 25: Identifying Tire Wear Patterns

Courtesy of CHRYSLER GROUP, LLC

Under inflation will cause wear on the shoulders of tire. Over inflation will cause wear at the center of tire.

Excessive camber causes the tire to run at an angle to the road. One side of tread is then worn more than the other.

Excessive toe-in or toe-out causes wear on the tread edges and a feathered effect across the tread.

TREAD WEAR INDICATORS

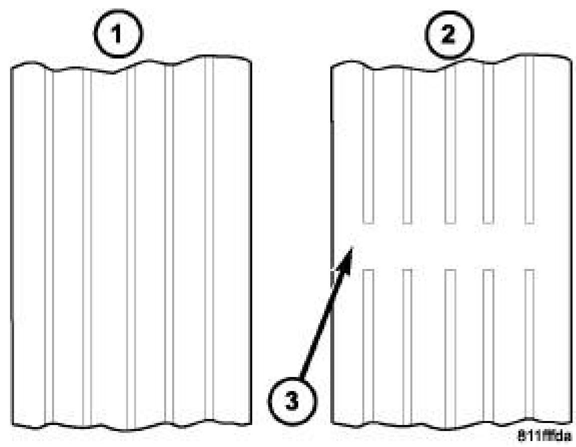

Fig. 26: Identifying Tread Wear Indicators
Courtesy of CHRYSLER GROUP, LLC

Tread wear indicators are molded into the bottom of the tread grooves. When tread depth is 1.6 mm (1/16 in.), the tread wear indicators will appear as a 13 mm (1/2 in.) band (3).

Tire replacement is necessary when indicators appear in two or more grooves or if localized balding occurs.

STANDARD PROCEDURE

TIRE INFLATION PRESSURES

The specified tire pressures have been chosen to provide safe operation, vehicle stability, and a smooth ride. The proper tire pressure specification can be found on the Tire And Loading Information Label provided with the vehicle (usually on the driver's door opening or B-pillar).

A quality air pressure gauge is recommended to check tire air pressure. Tire pressure should be checked cold once per month. Check tire pressure more frequently when the weather temperature varies widely. Tire pressure will decrease when the outdoor temperature drops. After checking the air pressure, replace valve cap finger tight.

Inflation pressures specified on the Tire Inflation Pressure Label are always the cold inflation pressure of the tire. Cold inflation pressure is obtained after the vehicle has not been operated for at least 3 hours, or the vehicle is driven less than one mile after being inoperative for 3 hours. Tire inflation pressures may increase from 2 to 6 pounds per square inch (psi) during operation. Do not reduce this normal pressure buildup.

Improper inflation can cause:

- Uneven wear patterns
- Reduced tread life
- Reduced fuel economy
- Unsatisfactory ride
- The vehicle to drift.

WARNING: Over or Under inflated tires can affect vehicle handling. The tire can fail suddenly, resulting in loss of vehicle control.

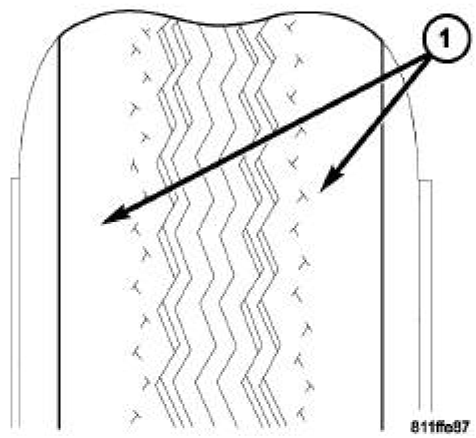

Fig. 27: Under Inflation
Courtesy of CHRYSLER GROUP, LLC

Under inflation causes rapid shoulder wear, tire flexing, and can result in tire failure (1).

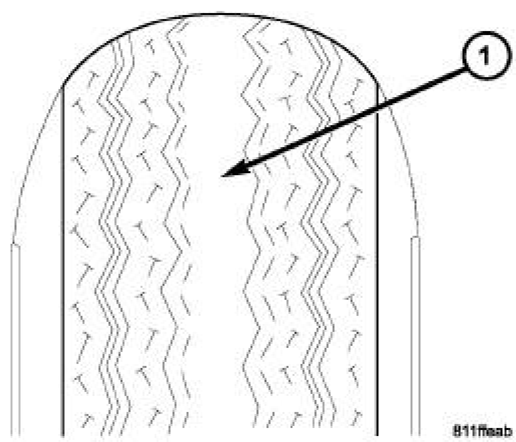

Fig. 28: Identifying Over Inflated Tire
Courtesy of CHRYSLER GROUP, LLC

Over inflation causes rapid center wear and loss of the tire's ability to cushion shocks (1).

TIRE LEAK REPAIRING

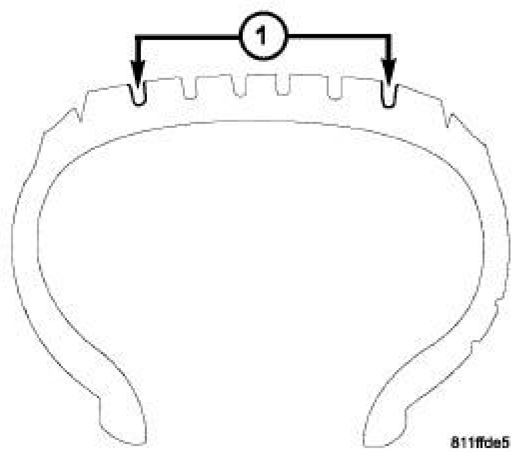

Fig. 29: Identifying Tire Repair Area
Courtesy of CHRYSLER GROUP, LLC

For proper repairing, a radial tire must be removed from the wheel. Repairs should only be made if the defect, or puncture, is in the tread area (1). The tire should be replaced if the puncture is located in the sidewall.

Deflate tire completely before attempting to dismount the tire from the wheel. **Use a lubricant such as a mild soap solution when dismounting or mounting tire.** Use tools free of burrs or sharp edges which could damage the tire or wheel rim.

Before mounting tire on wheel, make sure all rust is removed from the rim bead and repaint if necessary.

Install the tire and wheel assembly. Refer to **INSTALLATION**.

WHEELS

DESCRIPTION

DESCRIPTION

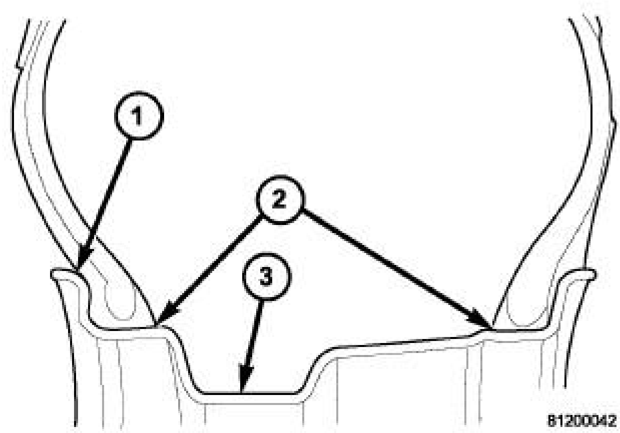

Fig. 30: Identifying Wheel/Rim Design

Courtesy of CHRYSLER GROUP, LLC

All vehicles use either steel, cast aluminum, or forged wheels. The original equipment wheels are designed for proper operation at all loads up to the specified maximum vehicle capacity.

Every wheel has raised sections between the rim flanges (1) and drop well (3) called safety humps (2). In case of air loss, these raised sections help hold the tire in position on the wheel until the vehicle can be brought to a safe stop. When the tire is installed on the wheel, initial inflation pressure forces the tire bead over these raised sections into place.

The wheel studs and nuts are designed for specific wheel applications and must be replaced with equivalent parts. Do not use replacement parts of lesser quality or of a substitute design. All aluminum and steel wheels have wheel stud nuts with a cone shape. All lug nuts have a cone shaped interface to ensure proper retention of the wheels.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - WHEEL INSPECTION

Inspect wheels for:

- Excessive runout
- Dents, cracks or irregular bends
- Damaged wheel stud (lug) holes
- Air Leaks

NOTE: **Do not attempt to repair a wheel by hammering, heating or welding.**

If a wheel is damaged, an original equipment replacement wheel should be used. When obtaining replacement wheels, they should be equivalent in load carrying capacity. The diameter, width, offset, pilot hole and bolt circle of the wheel should be the same as the original wheel.

WARNING: **Failure to use equivalent replacement wheels may adversely affect the safety and handling of the vehicle.**

WARNING: **Replacement with used wheels is not recommended. The service history of the wheel may have included severe treatment or very high mileage. The rim could fail without warning.**

WARNING: **Chrysler LLC does not recommend that customers use "reconditioned" wheels (wheels that have been damaged and repaired) because they can result in a sudden catastrophic wheel failure which could cause loss of control and result in injury or death. For clarification:**

- **Cosmetic refinishing for the purpose of repairing a superficial flaw is an acceptable procedure providing it is limited to paint or clear coat only, the wheel is not modified in any way, and there is no exposure to paint curing heat over 200 degrees Fahrenheit (93 degrees Celsius).**
- **Damaged wheels are those which have been bent, broken, cracked or**

sustained some other physical damage which may have compromised the wheel structure.

- **Repaired indicates that the wheel has been modified through bending, welding, heating, straightening, or material removal to rectify damage.**
- **Re-plating of chrome plated wheels is not an acceptable procedure nor is chrome plating of original equipment painted or polished wheels, as this may alter mechanical properties and affect fatigue life.**

SPECIFICATIONS

Tire Pressure Sensor Nut	3	-	27	Ā
*** New Fastener:** Do not reuse these fasteners. If removed, a new fastener must be installed and tightened to specifications.				

CLEANING

CLEANING

All wheels and wheel trim, especially aluminum and chrome plated, should be cleaned regularly using mild soap and water to maintain their luster and to prevent corrosion. Wash them with the same soap solution recommended for the body of the vehicle.

When cleaning extremely dirty wheels, care must be taken in the selection of tire and wheel cleaning chemicals and equipment to prevent damage to the wheels. MoparĀ® Tire and Wheel Cleaner, MoparĀ® Wheel Treatment or MoparĀ® Chrome Cleaner is recommended. Any of the "DO NOT USE" items listed below can damage wheels and wheel trim.

DO NOT USE:

- Any abrasive cleaner
- Any abrasive cleaning pad (such as steel wool) or abrasive brush
- Any cleaner that contains a high acid or high alkaline concentration which can react with and discolor the chrome surface. **Many wheel cleaners contain acids that can harm the wheel surface.**
- Oven cleaner
- A car wash that uses carbide-tipped wheel cleaning brushes or acidic solutions.

STUD, WHEEL, FRONT

REMOVAL

REMOVAL

NOTE: **Before proceeding, refer to CAUTION and WARNING .**

CAUTION: **Wheel mounting studs MUST NOT be hammered out of hub flange of hub and bearing assembly. If a stud is removed by hammering it out, damage to hub and bearing assembly will occur leading to premature bearing failure.**

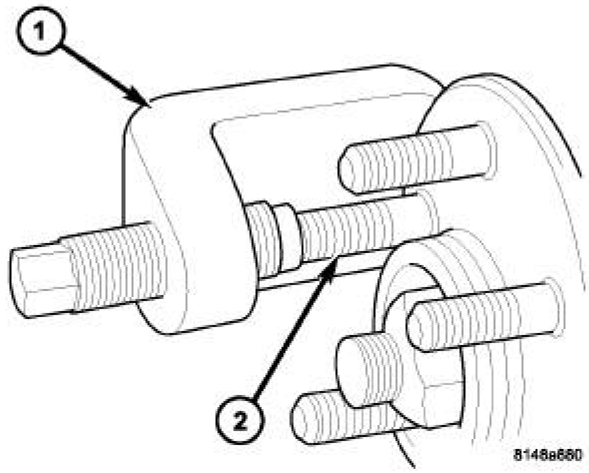

Fig. 31: Wheel Stud
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the front tire and wheel assembly. Refer to **REMOVAL**.
3. Remove the front brake rotor. Refer to **ROTOR, BRAKE, REMOVAL** .
4. Remove stud (2) from hub with Remover (special tool #C-4150A, Press, Ball Joint) (1).

INSTALLATION

INSTALLATION

1. Install the new stud into the hub flange.
2. Install three washers onto the stud, then install the lug nut with the flat side of the nut against the washers.
3. Tighten the lug nut until the stud is pulled into the hub flange. Verify that the stud is properly seated into the flange.
4. Remove the lug nut and washers.
5. Install brake rotor and caliper. Refer to **ROTOR, BRAKE, INSTALLATION** .
6. Install the tire and wheel assembly, using a **NEW** lug nut on the stud that was replaced. Refer to **INSTALLATION**.
7. Remove support and lower the vehicle.

STUD, WHEEL, REAR

REMOVAL

REMOVAL

NOTE: **Before proceeding, refer to CAUTION and WARNING .**

CAUTION: **Wheel mounting studs MUST NOT be hammered out of hub flange of hub and bearing assembly. If a stud is removed by hammering it out, damage to hub and bearing assembly will occur leading to premature bearing failure.**

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the rear tire and wheel assembly. Refer to **REMOVAL**.
3. Remove the rear brake rotor. Refer to **ROTOR, BRAKE, REMOVAL** .

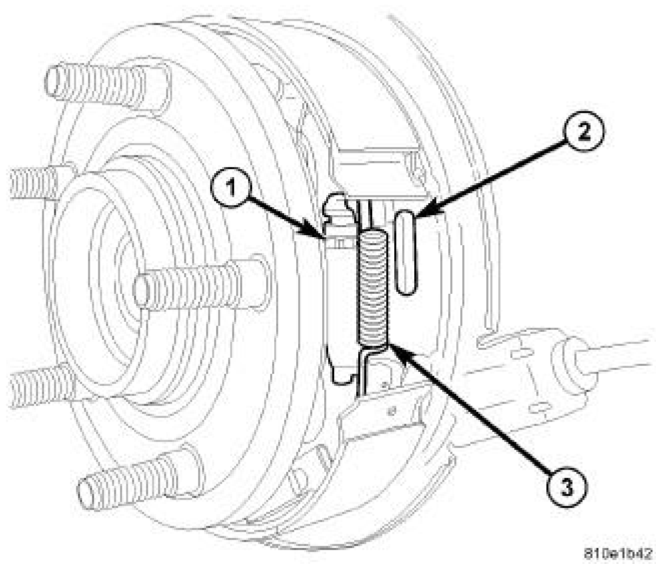

Fig. 32: Shoe Adjuster & Spring
Courtesy of CHRYSLER GROUP, LLC

4. Back off shoe adjustment until adjuster (1) threads bottom.
5. Using appropriate tools, remove spring (3) at adjuster.
6. Pull upward on upper shoe near adjuster to provide enough slack to remove adjuster from shoes, then remove adjuster (1).

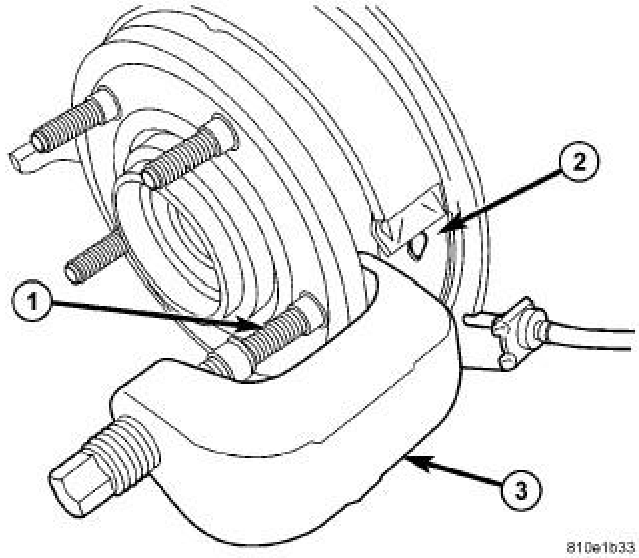

Fig. 33: C-4150A Positioned For Stud Removal
Courtesy of CHRYSLER GROUP, LLC

7. Install Remover (3) (special tool #C-4150A, Press, Ball Joint), on hub and bearing flange and wheel stud (1).
8. Tighten Remover forcing screw, pushing wheel stud (1) out of hub and bearing flange. Remove tool (3).
9. Remove stud from rear of hub flange. It may be necessary to rock hub flange back and forth to ease stud removal.

INSTALLATION

INSTALLATION

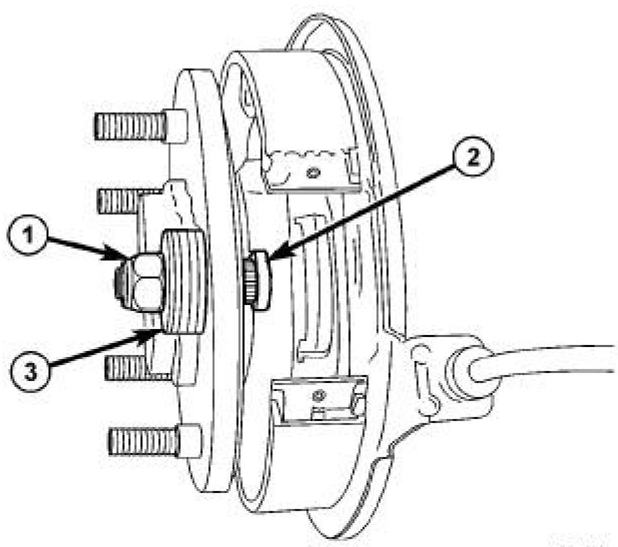

Fig. 34: Nut & Washers Installed On Stud
Courtesy of CHRYSLER GROUP, LLC

1. Install replacement wheel stud into flange of hub and bearing from rear (2). Install a stack of washers (3)

(approximately 5, depending on thickness) over stud, then install a standard wheel mounting (lug) nut (1) on stud with flat side of nut against washers.

2. Tighten wheel mounting nut (1), pulling wheel stud into flange of hub and bearing. Once head of stud (2) is fully seated against rear of hub flange, remove nut and washers from wheel stud.

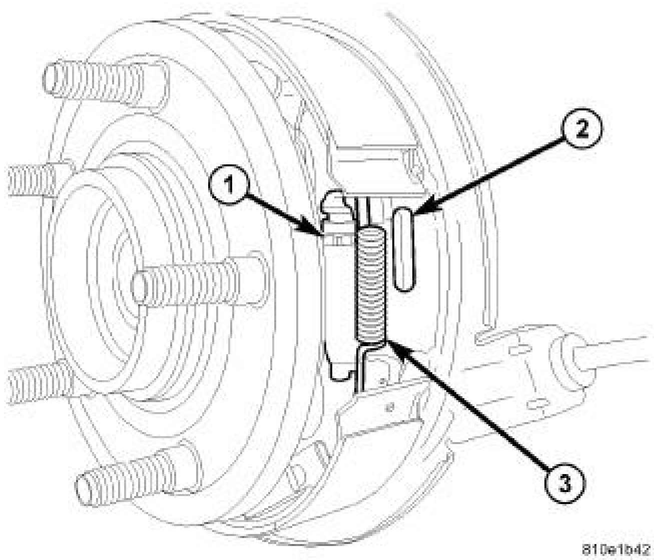

Fig. 35: Shoe Adjuster & Spring
Courtesy of CHRYSLER GROUP, LLC

3. Install parking brake shoe adjuster (1) between upper and lower parking brake shoes. Position end of adjuster with star wheel upward. Once in place, slide upper shoe downward against adjuster mounting slot, taking up any slack between two pieces.
4. Using appropriate tools, install spring (3) at adjuster.
5. Install brake rotor. Refer to **ROTOR, BRAKE, INSTALLATION** .
6. Install the tire and wheel assembly. Refer to **INSTALLATION**.
7. Adjust parking brake shoes. Refer to **SHOES, PARKING BRAKE, ADJUSTMENTS** .
8. Remove support and lower the vehicle.

TIRE PRESSURE MONITOR SYSTEM

Chry - Dodge - Challenger & Charger - 2008-18

MODEL COVERAGE

Models Covered

Model	Year(s)
Challenger	2008-18
Charger	2009-18

DESCRIPTION & OPERATION

NOTE: **If a tire pressure sensor has been replaced, the tire pressure sensors must be retrained. See RESET PROCEDURES.**

TIRE PRESSURE MONITOR (TPM) SYSTEM

The Tire Pressure Monitoring (TPM) system monitors air pressure in the four road tires (excludes spare). Pressure in the spare tire is not monitored. There are two tire pressure monitoring systems available, a base system and a premium system. The base system does not specify how many tires are low or where they are located. The premium system does so.

The Base TPM system consists of tire pressure monitoring sensors attached to each road wheel through the valve stem mounting hole, a central receiver module Wireless Ignition Node (WIN), and an indicator lamp.

The Premium TPM system consists of tire pressure monitoring sensors attached to each road wheel through the valve stem mounting hole, a wireless control module (WIN), three wheel sensor transponders located in three of the four wheel wells, an electronic display, and an indicator lamp.

The TPM module decodes the RF signals transmitted by each of the vehicle's tire pressure sensors. The decoded information is used to determine if "warning" or "fault" conditions exist within the TPM system.

Upon detection of a warning or fault condition, the WIN will send a request to the module that controls the indicator lamp (and the text display if equipped with the Premium system) via the vehicle bus system to illuminate or flash the indicator lamp. Also, upon detection of a warning or fault condition, the electronic display will send a request to sound the "chime". The WIN will store all warning and fault conditions, placard pressure values and low-pressure threshold values (lamp ON and OFF) in memory that can be accessed through diagnostic communication. If new sensors are introduced to the vehicle, the data stored for the sensor being replaced will be deleted.

The WIN will store all wheel sensor IDs and locations and faults in memory that can be accessed through diagnostic communication. All other data values transmitted from each active wheel sensor (not the spare tire) shall be stored in the WIN memory. After a sensor has been replaced, the WIN automatically learns and stores the sensor ID's while driving continuously above 15 mph (24 km/h) for 10 minutes. The learning sequence will initiate when the vehicle has been stopped for more than 20 minutes.

Under the following conditions, the system may not function properly:

- The areas, facilities or devices that use similar radio wave frequencies are located in the vicinity of the vehicle.
- A radio device of similar frequency is used near the vehicle.
- Installing some form of aftermarket window tinting that affects radio wave signals
- A lot of snow or ice is stuck to the vehicle, especially around the wheels or wheel housings.
- Using tire chains on the vehicle
- The battery of the sensor has been depleted (approximate 10-year life span).
- A spare tire is installed.
- A tire without tire pressure sensor is used.
- Wheels other than manufacturer factory wheels are used.

TIRE PRESSURE MONITOR WARNING INDICATORS

If warning indicators are on continuously due to low pressure in one or more tires, adjust tire inflation to specification. The light will remain on until tire pressure is properly set. After adjusting air pressure in a tire on the vehicle, the vehicle needs to be driven for approximately two minutes above 15 mph for the message or indicator lamp to go out.

If a system fault is detected, a chime will sound, and the TPM indicator (telltale) lamp will flash for 75 seconds, then remain on solid. For vehicles with the Premium TPM Systems, a "CHECK TPM SYSTEM" message will appear in the Electronic Vehicle Information Center (EVIC), followed by a graphic display. See appropriate manufacturer service information.

TPMS RESET PROCEDURES

NOTE: **If a tire pressure sensor has been replaced, the tire pressure sensors must be retrained.**

If warning indicators are on continuously due to low pressure in one or more tires, adjust tire inflation to specification. The light will remain on until tire pressure is properly set. After adjusting air pressure in a tire on the vehicle, the vehicle needs to be driven for approximately two minutes above 15 mph for the message or indicator lamp to go out.

TIRE PRESSURE SENSOR RETRAINING

Using a RF signal, each sensor transmits tire pressure data approximately once every minute. Each sensor's (transmitter) broadcast is uniquely coded so that the system can monitor the state of each of the sensors on the 4 rotating road wheels. The TPMS automatically learns and stores the sensor's ID while driving after a sensor has been replaced. There is no formal retraining procedure necessary.

After the vehicle has remained stationary for 20 minutes, drive vehicle for a minimum of 20 minutes while maintaining a continuous speed above 15 mph (24 km/h). During this time, the system will learn the new sensor ID code and will clear any DTCs automatically. If a sensor cannot be trained, see appropriate manufacturer service information.

NOTE: **A new sensor ID can also be programmed directly into the WIN or TPM module by using a RKE-TPM Analyzer in conjunction with a Scan Tool. Once the new**

sensor ID has been programmed, the vehicle will need to be driven above 15 mph until the fault is no longer active (lamp extinguishes) and display is updated (for up to 20 minutes). Using a TPM-RKE Analyzer can take up to a minute to force a transmission from a sensor.

DISMOUNTING/MOUNTING PROCEDURES

CAUTION: The tire should be dismounted from the wheel using the tire changer manufacturer's instructions. Use the following information to avoid damage during the dismounting/mounting procedures.

CAUTION: The Tire Pressure Monitoring (TPM) system has been optimized for the original equipment tires and wheels. TPM system pressures have been established for the tire size equipped on the vehicle. Undesirable system operation or sensor damage may result when using replacement equipment that is not of the same size, type, or style. Aftermarket wheels can cause sensor damage. Do not use aftermarket tire sealants or balance beads if your vehicle is equipped with TPM, as damage to the sensors may result.

NOTE: If a tire pressure sensor has been replaced, the tire pressure sensors must be retrained. See TIRE PRESSURE SENSOR RETRAINING under RESET PROCEDURES.

NOTE: Wheels and tires are match-mounted at the factory. Before dismounting a tire from its wheel, a reference mark should be placed on the tire at the valve stem location to ensure that it is remounted in the original position on the wheel. For match-mounting procedures, refer to appropriate manufacturer service information.

NOTE: Tire pressure will vary with temperature by about 1 psi (6.9 kPa) for every 12Â°F (6.5Â°C). This means that when the outside temperature decreases, the tire pressure will decrease. Tire pressure should always be set based on cold inflation tire pressure (placard pressure). This is defined as the tire pressure after a vehicle has not been driven for more than 3 hours (and in outside ambient temperature). The tire pressure will also increase as the vehicle is driven this is normal and there should be no adjustment for this increased pressure.

NOTE: If tires require leak-testing, a water test may be used to check for a leak around the sensor, as long as any water at the valve core is removed when procedure is completed. Water can be expelled from the core area by pushing in on the core for several seconds, allowing escaping air to drive out any moisture. Reinflate tire as necessary. Install original valve stem cap.

TIRE PRESSURE SENSOR

CAUTION: This vehicle uses the 433 MHz TPM sensor. Although 315 MHz and 433 MHz sensors are identical in size and shape, they are not interchangeable. Always

make sure the correct sensor is being used. A RKE-TPM Analyzer can be used to determine the sensor's frequency without having to dismount the tire.

CAUTION: The cap used on this valve stem contains an O-ring seal to prevent contamination and moisture from entering the valve stem. Retain this valve stem cap for reuse. Do not substitute a regular valve stem cap in its place.

CAUTION: Do not attempt to install a tire pressure sensor in an aftermarket wheel. Use tire pressure sensors in original style factory wheels only. If aftermarket wheels are installed, and therefore do not contain tire pressure sensors, the system will not function properly and the driver will be continuously notified of a system malfunction.

CAUTION: After inspecting or adjusting the tire pressure always reinstall the valve stem cap. This will prevent moisture and dirt from entering the valve stem, which could damage the Tire Pressure Sensor.

CAUTION: The valve stem used on this vehicle is made of aluminum and the core is nickel plated brass. The original valve stem core must be reinstalled and not substituted with a valve stem core made of a different material. This is required to prevent corrosion in the valve stem caused by the different metals.

CAUTION: Any time a sensor is to be installed in a wheel, it is necessary to install a new sensor-to-wheel seal, metal washer and valve stem nut, to ensure airtight sealing. See Fig. 1.

CAUTION: DO NOT reuse sensor-to-wheel grommet. Always use a new grommet when installing a pressure sensor and properly torque the sensor nut.

Removal (SRT8 Models)

1. Remove tire and wheel assembly from vehicle.
2. Dismount tire from wheel following tire changer manufacturer's instructions while paying special attention to the following to avoid damaging the pressure sensor:
   - When breaking the tire bead loose from the wheel rim, avoid using the Bead Breaker in the area of the sensor. That includes both front and rear beads of the tire. See **Fig. 3**.
   - When preparing to dismount the tire from the wheel, carefully insert the mounting/dismounting tool 280Â° +/- 10Â° from the valve stem, then proceed to dismount the tire from the wheel. Use this process on both the upper and lower tire beads.
3. Using a thin-walled socket, remove special nut retaining sensor to wheel. While removing nut, hold pressure against rear of metal valve stem to keep valve stem from pushing rearward, which could damage antenna strap.
4. Remove sensor from wheel.

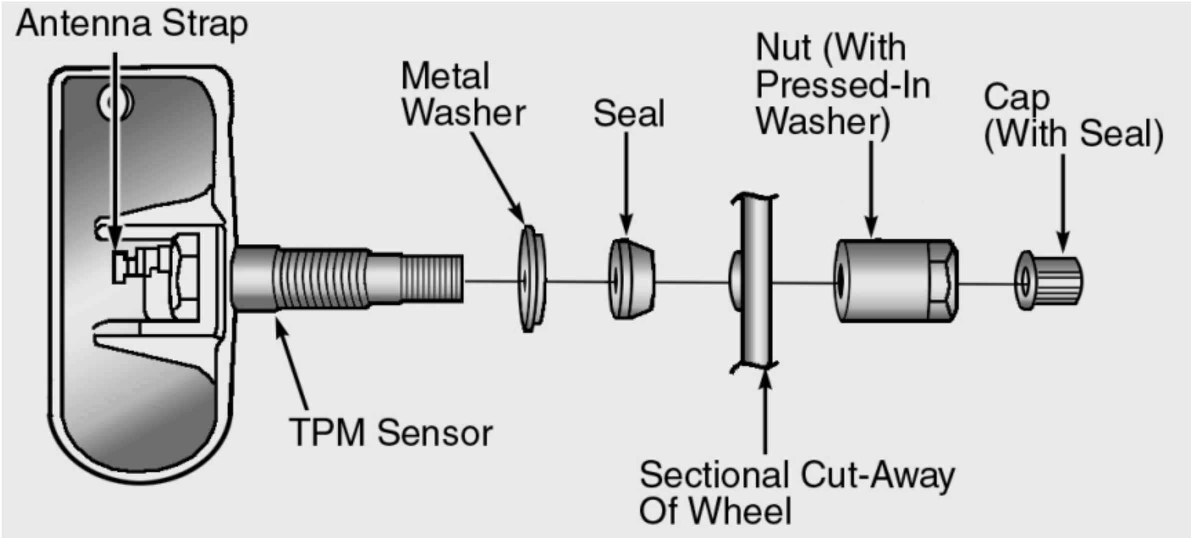

Fig. 1: Identifying Tire Pressure Sensor Components (SRT8)
Courtesy of CHRYSLER CORP.

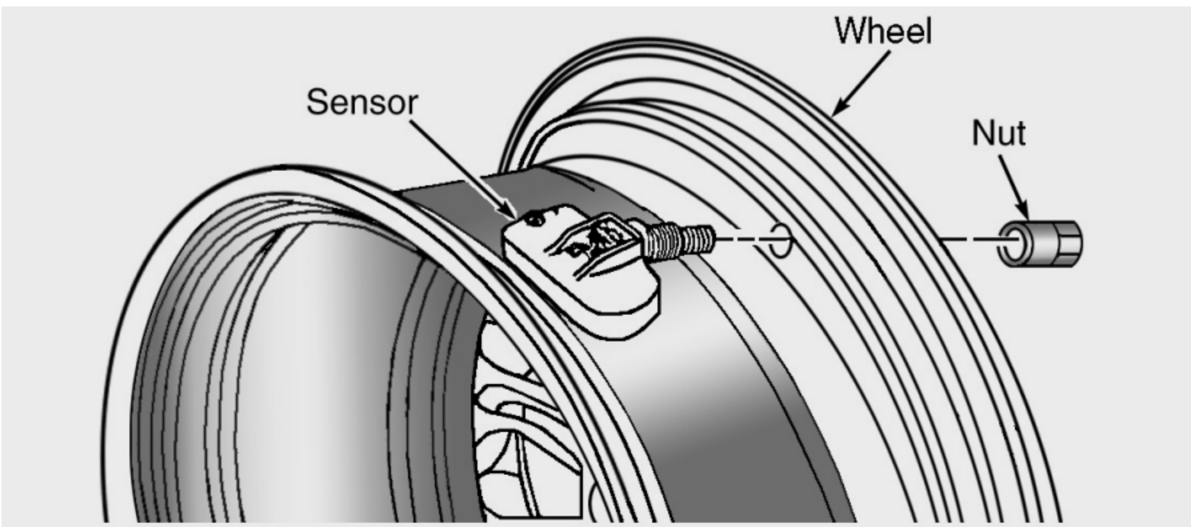

Fig. 2: Removing & Installing Tire Pressure Sensor (SRT8)
Courtesy of CHRYSLER CORP.

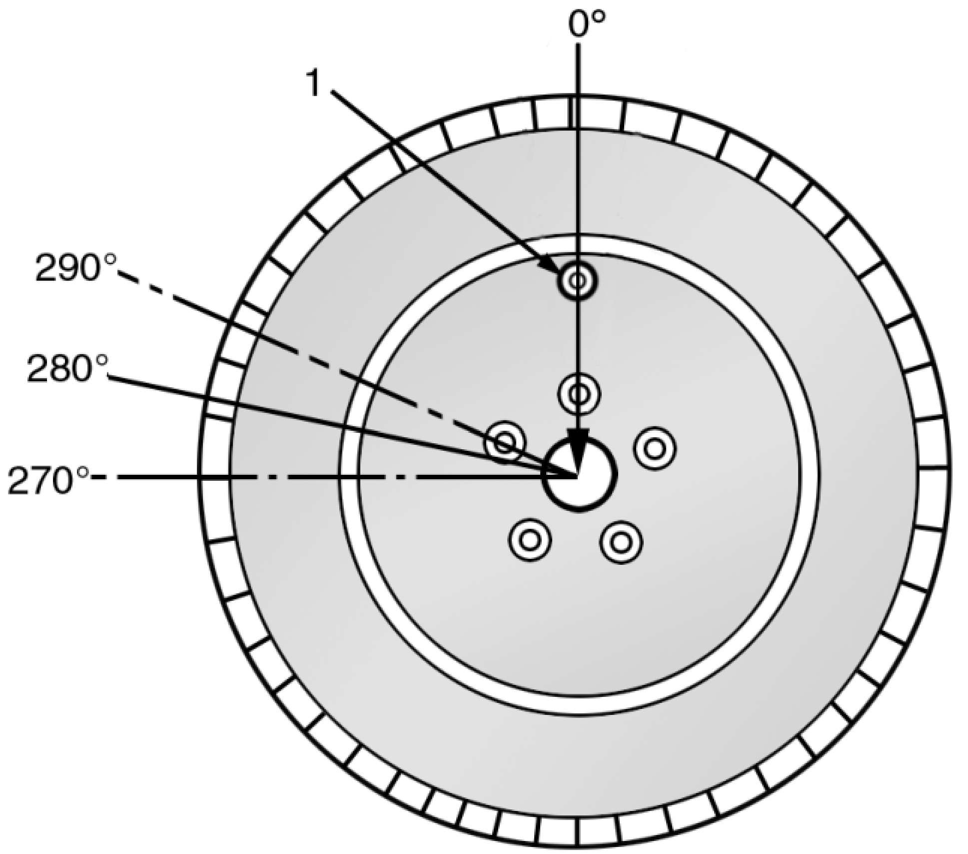

Fig. 3: Dismounting Tire With Tool
Courtesy of CHRYSLER CORP.

Removal (Non-SRT8 Models)

1. Remove tire and wheel assembly from vehicle.
2. Dismount tire from wheel following tire changer manufacturer's instructions while paying special attention to the following to avoid damaging the pressure sensor:
   - When breaking the tire bead loose from the wheel rim, avoid using the Bead Breaker in the area of the sensor. That includes both front and rear beads of the tire. See **Fig. 3**.
   - When preparing to dismount the tire from the wheel, carefully insert the mounting/dismounting tool 280Â° from the valve stem +/- 10Â°, then proceed to dismount the tire from the wheel. Use this process on both the upper and lower tire beads.
3. Remove the sensor to valve stem retainer screw (3) and remove the sensor (1) from the valve stem (2). See **Fig. 5**.
4. Remove the valve stem (2) from the wheel (4). See **Fig. 5**.

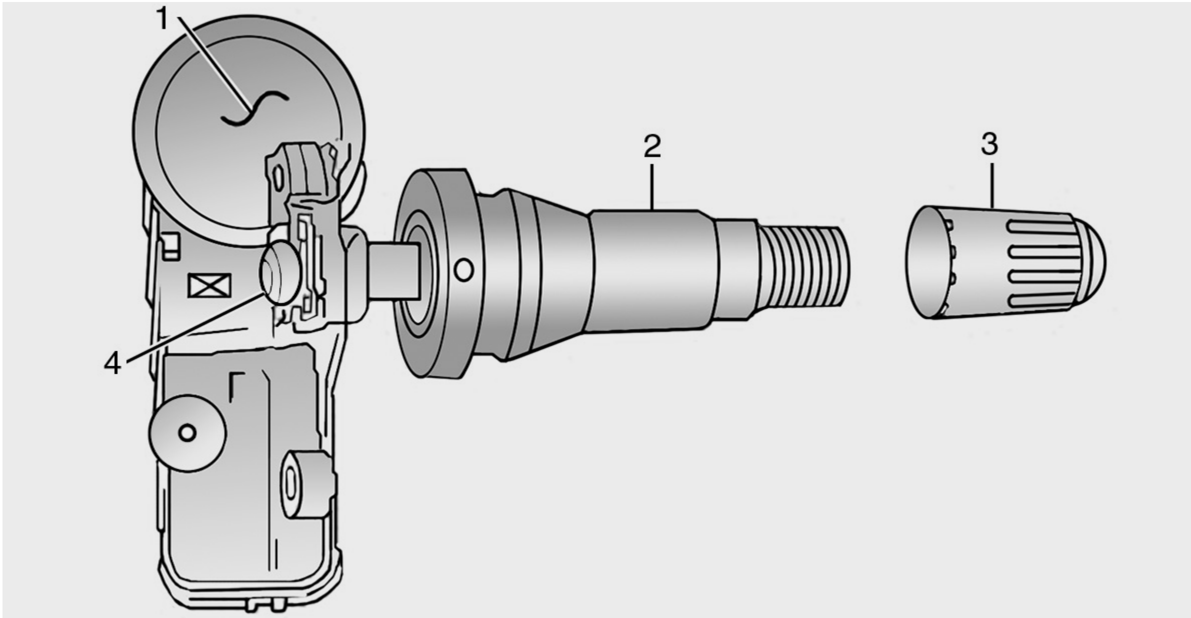

Fig. 4: Identifying Tire Pressure Sensor Components (Non-SRT8)
Courtesy of CHRYSLER GROUP, LLC

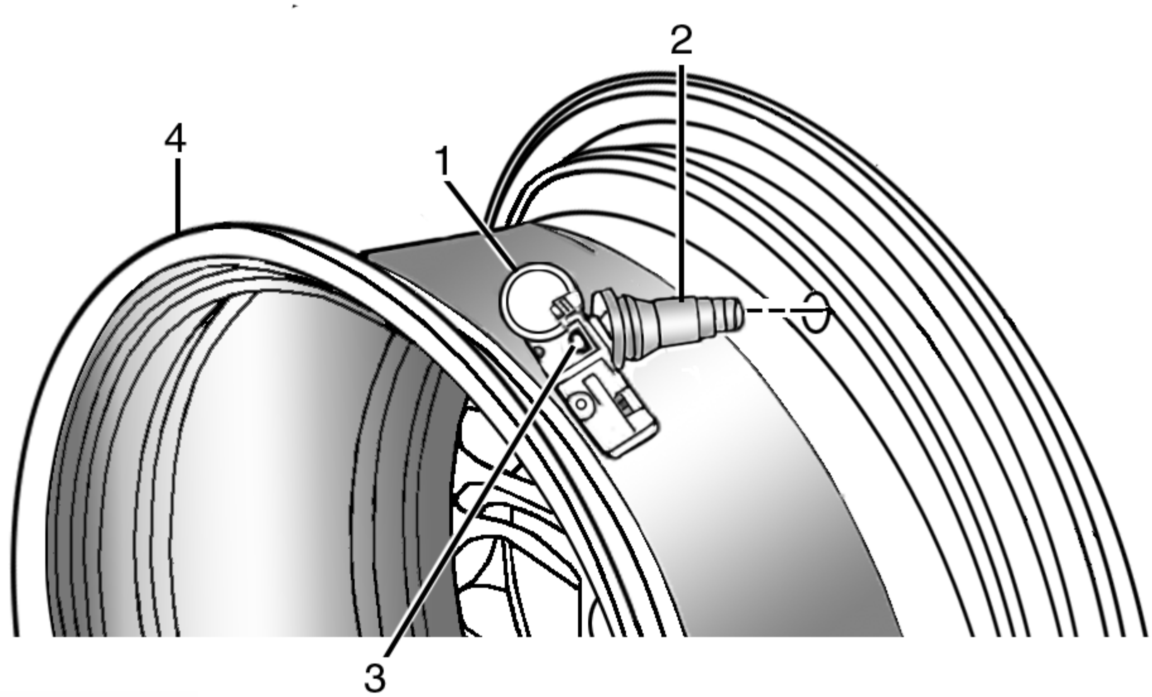

Fig. 5: Removing & Installing Tire Pressure Sensor (Non-SRT8)
Courtesy of CHRYSLER GROUP, LLC

Installation (SRT8 Models)

NOTE: **Before reinstalling an existing tire pressure sensor, replace seal and metal washer at base of valve stem to ensure proper sealing. See Fig. 1.**

1. Wipe area clean around sensor/valve stem mounting hole in wheel. Make sure surface of wheel is not damaged.

CAUTION: To avoid damaging sensor antenna strap, hold pressure against rear of metal valve stem while sensor is inserted through wheel mounting hole and nut is installed.

2. Insert sensor through wheel as shown keeping pressure against rear of metal valve stem. Potted side of sensor is to be positioned toward wheel. Do not attempt to mount sensor otherwise, or damage may occur. Install sensor nut (with pressed-in washer) by hand. See **Fig. 6**.

NOTE: Before tightening sensor nut, push downward on sensor housing in an attempt to make it flush with interior contour of wheel.

3. Using a thin-walled socket, install sensor nut. While holding sensor in position, tighten sensor nut to 71 INCH lbs. (8 N.m).

CAUTION: Over-torquing the sensor nut by as little as 106 INCH lbs. (12 N.m) may result in sensor separation from the valve stem. Under this condition, the sensor may still function; however, the condition should be corrected immediately.

4. Mount tire on wheel following tire changer manufacturer's instructions, paying special attention to the following to avoid damaging tire pressure sensor:

   - **Rotating Wheel Tire Changers**

     Once the wheel is mounted to the changer, position the sensor valve stem approximately 280Ā° from the head of the changer in a clockwise direction before rotating the wheel (also in a clockwise direction) to mount the tire. Use this procedure on both the upper and lower tire beads. See **Fig. 7**.

   - **Rotating Tool Tire Changers**

     Position the wheel on the changer so that the sensor valve stem is approximately 210Ā° from the head of the changer in a clockwise direction from the mounting end of the tool. See **Fig. 8**. Make sure the sensor is clear of the lower bead breaker area to avoid damaging the sensor when the breaker rises. Rotate the tool in a counterclockwise direction to mount the tire. Use this procedure on both the upper and lower tire beads.

5. Adjust air pressure to specification. Make sure original style valve stem cap is securely installed to keep moisture out of sensor. Install wheel and tire assembly on vehicle.
6. Drive vehicle for a minimum of 5 minutes while maintaining a continuous speed above 15 mph (24 km/h). During this time, the system will learn the new sensor ID code and will clear any DTCs automatically. If a sensor cannot be trained, see appropriate manufacturer service information.

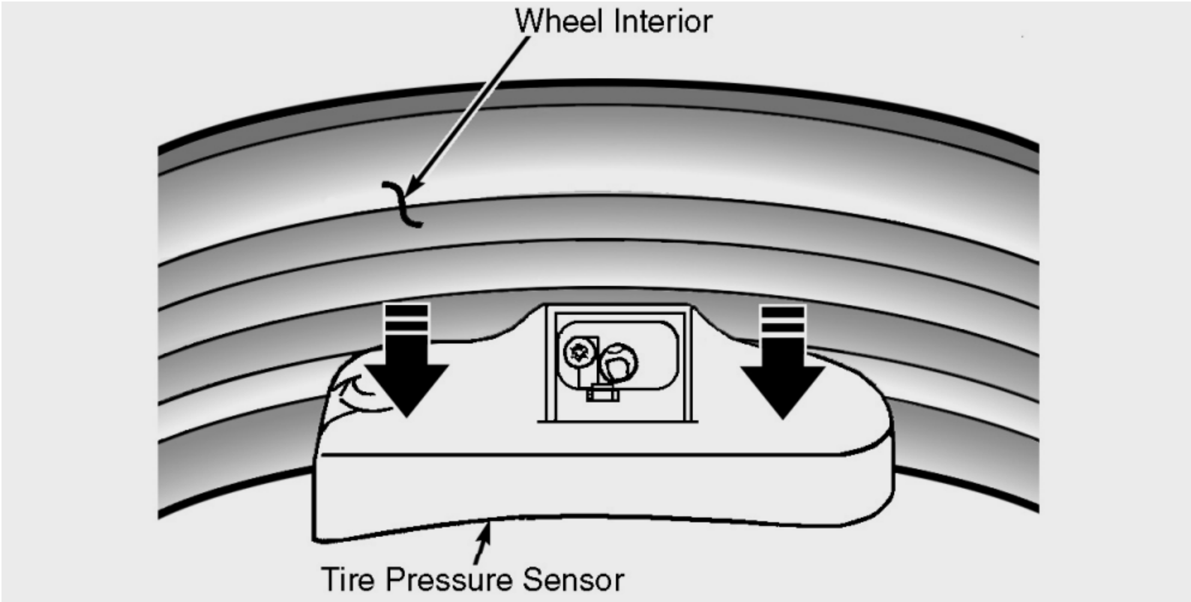

Fig. 6: Installing Tire Pressure Sensor
Courtesy of CHRYSLER CORP.

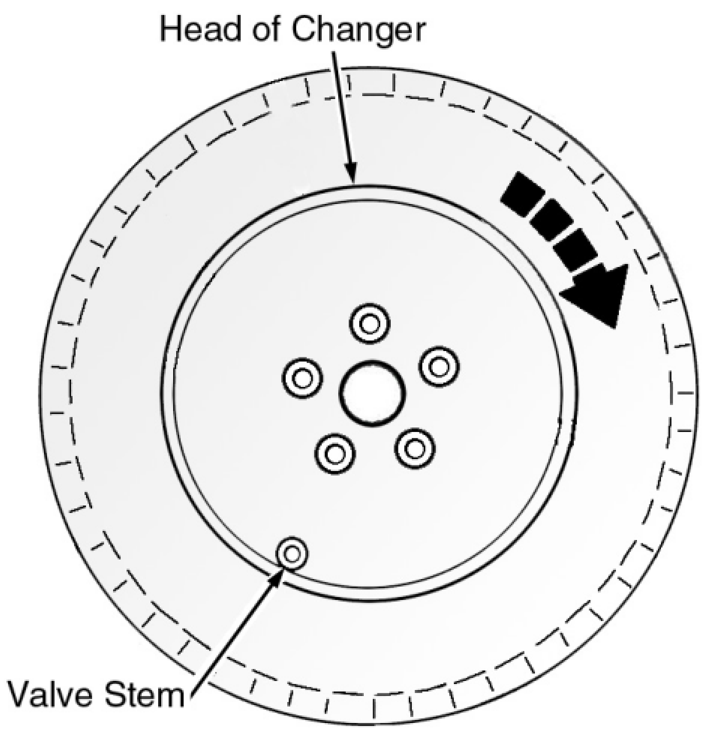

Fig. 7: Mounting Tire Using Rotating Wheel Machine
Courtesy of CHRYSLER CORP.

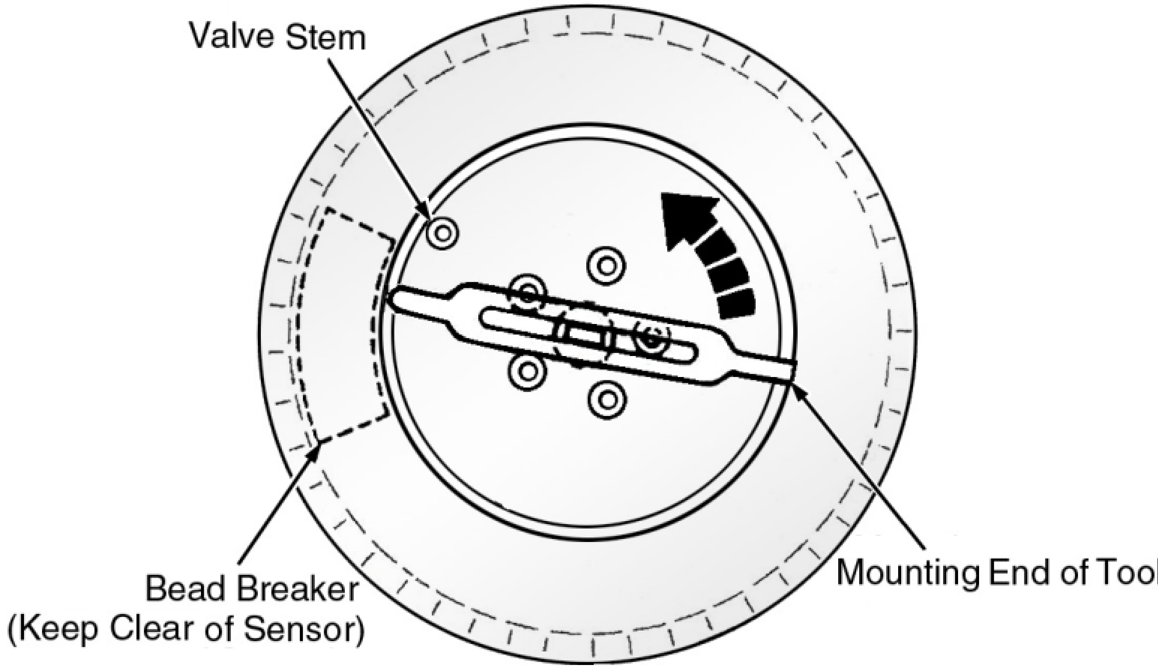

Fig. 8: Mounting Tire Using Rotating Tool Machine
Courtesy of CHRYSLER CORP.

Installation (Non-SRT8 Models)

NOTE: **If replacing tire pressure sensor, a new valve stem will be pre-mounted to the sensor as an assembly. Verify that the sensor is positioned properly before seating the valve stem. If replacing a valve stem only (using the existing tire pressure sensor), the new valve stem will include a new tire pressure sensor mounting screw. Always use a new mounting screw when attaching a sensor to a valve stem.**

CAUTION: **Any time a sensor is to be reinstalled in a wheel, an new valve stem assembly must be installed to ensure air tight sealing.**

1. Wipe area clean around sensor. valve stem mounting hole in wheel (4). Make sure surface of wheel is not damaged. See **Fig. 5**
2. Insert valve stem (2) through wheel (4) and pull through to seat with standard valve stem installation tool. See **Fig. 4**
3. If replacing the valve stem (2) only, verify that the flat sides of the brass extension on the bottom of the valve stem (2) are at a 90 degree angle with the wheel. Position the pressure sensor (1) over the brass extension, install the retainer screw (4) and tighten to 1.4 N.m (12 in. lbs) See **Fig. 4**
4. Mount tire on wheel following tire changer manufacturer's instructions, paying special attention to the following to avoid damaging tire pressure sensor:

   - **Rotating Wheel Tire Changers**

     Once the wheel is mounted to the changer, position the sensor valve stem (2) approximately 280Â° from the head of the changer in a clockwise direction before rotating the wheel (also in a clockwise direction) to mount the tire. Use this procedure on both the upper and lower tire beads. See **Fig. 7**.

- **Rotating Tool Tire Changers**

  Position the wheel on the changer so that the sensor valve stem is approximately 210Â° clockwise from the installation end of the mounting/dismounting tool once the tool is mounted for tire installation. See **Fig. 8**. Make sure the sensor is clear of the lower bead breaker area to avoid damaging the sensor when the breaker rises. Rotate the tool in a counterclockwise direction to mount the tire. Use this procedure on both the upper and lower tire beads.
- Adjust air pressure to specification. Make sure original style valve stem cap is securely installed to keep moisture out of sensor. Install wheel and tire assembly on vehicle.
- Drive vehicle for a minimum of 10 minutes while maintaining a continuous speed above 15 mph (24 km/h). During this time, the system will learn the new sensor ID code and will clear any DTCs automatically. If a sensor cannot be trained, see appropriate manufacturer service information.

2015-16 MANUAL TRANSMISSION

TR6060 - Service Information - 6.2L - Challenger

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - MANUAL TRANSMISSION - TR6060

LOW LUBRICANT LEVEL

A low transmission lubricant level is generally the result of a leak, inadequate lubricant fill, or an incorrect lubricant level check.

Leaks can occur at the mating surfaces of the gear case or from the front/rear seals. A suspected leak could also be the result of an overfill condition.

Leaks at the rear of the housing will be from the oil seals. Leaks at component mating surfaces will probably be the result of inadequate sealer, gaps in the sealer, incorrect bolt tightening, use of a non-recommended sealer or incorrect/damaged gasket(s), if equipped.

A leak at the front of the transmission will be from either the front bearing retainer or retainer seal. Lubricant may be seen dripping from the clutch housing after extended operation. If the leak is severe, it may also contaminate the clutch disc causing the disc to slip, grab, and/or chatter.

A correct lubricant level check can only be made when the vehicle is level. Also allow the lubricant to settle for a minute or so before checking. These recommendations will ensure an accurate check and avoid an underfill or overfill condition. Always check the lubricant level after any addition of fluid to avoid an incorrect lubricant level condition.

HARD SHIFTING

Hard shifting can be caused by a low lubricant level, improper or contaminated lubricants. The consequence of using non-recommended lubricants is noise, excessive wear, internal bind, and hard shifting. Substantial lubricant leaks can result in gear, shift rail, synchronizer, and bearing damage. If a leak goes undetected for an extended period, the first indications of component damage are usually hard shifting and noise.

Shift component damage, incorrect clutch adjustment or a worn or damaged clutch pressure plate or disc are additional probable causes of increased shift effort. If clutch problem is advanced, gear clash during shifts can result. Worn or damaged synchronizer rings can cause gear clash when shifting into any forward gear. In some new or rebuilt transmissions, new synchronizer rings may tend to stick slightly causing hard or noisy shifts. In most cases, this condition will decline as the rings wear-in.

TRANSMISSION NOISE

Most manual transmissions make some noise during normal operation. Gears can generate a rotational noise or rattle that is audible during idle in neutral, or generate a mild whine that is audible during regular driving. These conditions are normal and do not require repair.

Severe, highly audible transmission noise is generally the initial indicator of a lubricant problem. Insufficient, improper or contaminated lubricant will promote rapid wear of gears, synchros, shift rails, forks and bearings.

The overheating caused by a lubricant problem, can also lead to gear and bearing damage.

STANDARD PROCEDURE

STANDARD PROCEDURE - DRAIN AND FILL

CAUTION: **Hypoid gear lube must not be used in this transmission. Use of hypoid gear lube will cause hard shifting effort/transmission failure.**

NOTE: **Failure to properly fill this transmission with the specified amount of transmission fluid will result in transmission damage.**

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

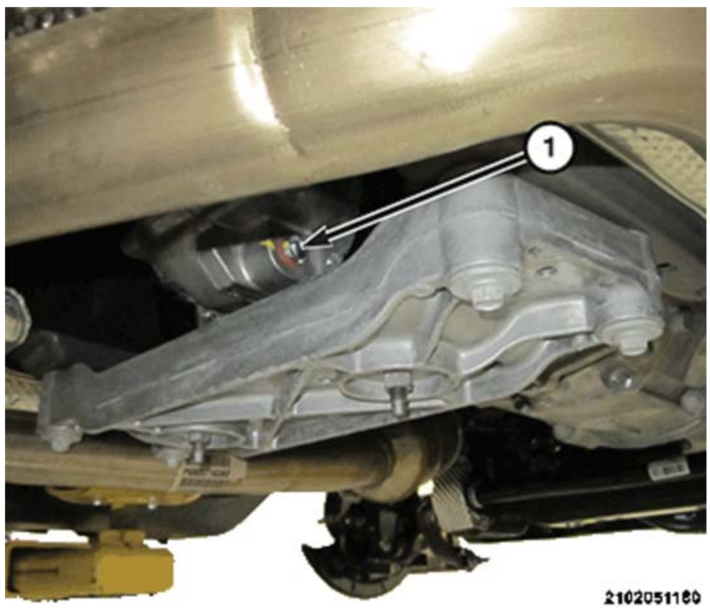

Fig. 1: Transmission Drain Plug
Courtesy of CHRYSLER GROUP, LLC

2. Remove transmission drain plug (1) and drain the transmission fluid.
3. Install transmission drain plug (1) and tighten to the proper **SPECIFICATIONS** .

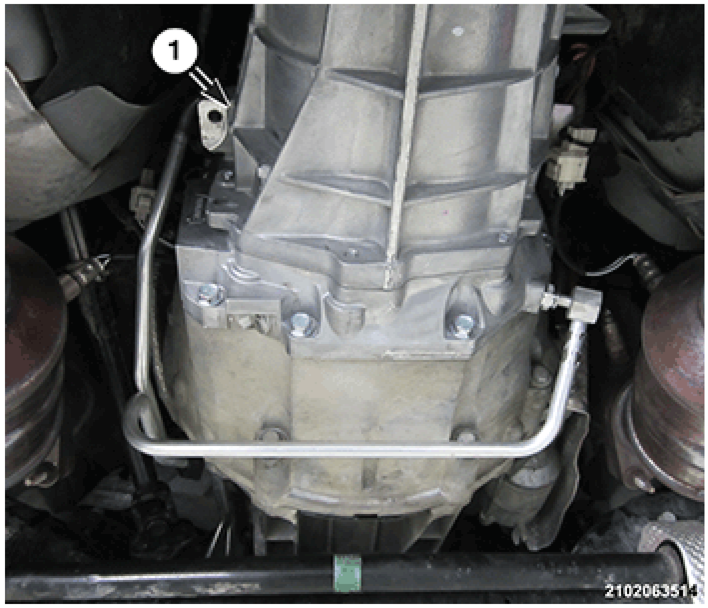

Fig. 2: Upper Transmission Cooler Line
Courtesy of CHRYSLER GROUP, LLC

4. Remove the upper transmission cooler line.
5. Fill the transmission with the specified fluid. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
6. Install the upper transmission cooler line.

ADJUSTMENTS

ADJUSTMENTS

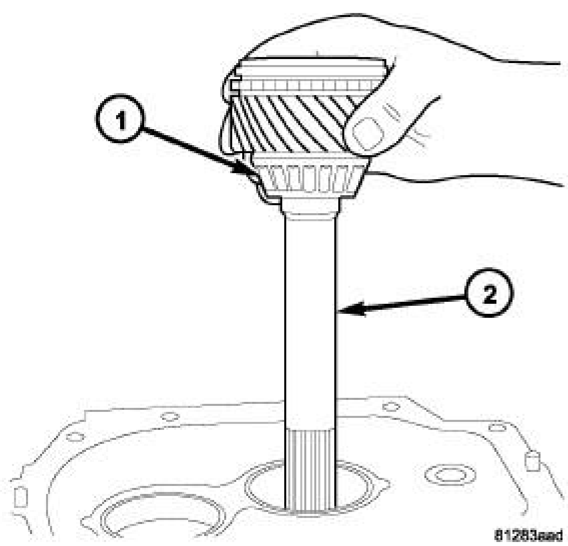

Fig. 3: Input Shaft
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The following procedure must be performed, when an input shaft (2) or tapered**

bearing (1) has been replaced. The measurement is performed with all shims removed from the front adapter.

1. Install the input shaft (2) into the adapter.

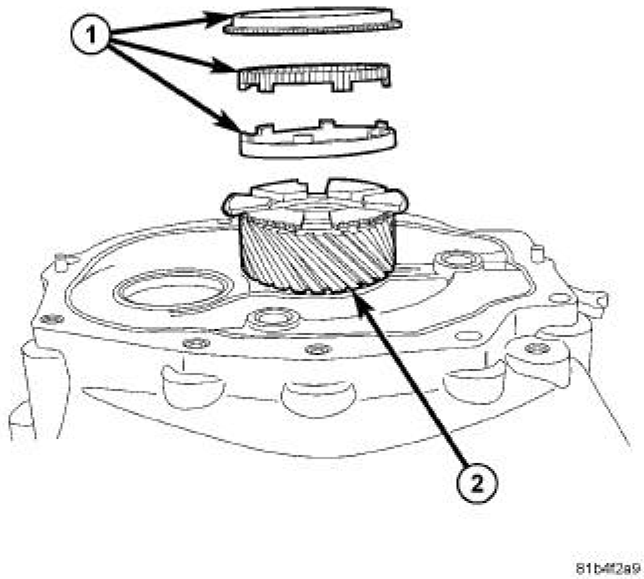

Fig. 4: Input Shaft Synchro Rings
Courtesy of CHRYSLER GROUP, LLC

2. Install the fourth gear synchronizer rings (1) on the input shaft (2).
3. Install mainshaft and countershaft.
4. Install the case on the adapter and tighten the bolts to the proper **SPECIFICATIONS** .

MAINSHAFT BEARINGS END-PLAY

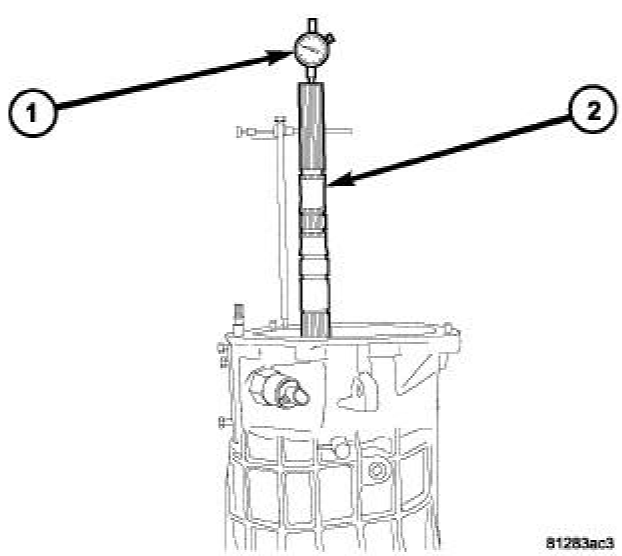

Fig. 5: Mainshaft & Dial Indicator
Courtesy of CHRYSLER GROUP, LLC

1. Rotate input shaft/mainshaft several time to seat the bearings.
2. Screw dial indicator Stud (special tool #8161, Adapter Rod) into the case.
3. Attach a dial indicator (1) to the stud and set dial indicator (1) plunger on the end of the mainshaft (2).
4. Zero the dial indicator (1), then push up on the input shaft and record the dial indicator end-play measurement.
5. Subtract 0.0127 - 0.0889 mm (0.0005 - 0.0035 in.) from the recorded dial indicator end-play measurement. The remainder is the shim thickness needed behind the input shaft bearing cup in the front adapter.

COUNTERSHAFT BEARINGS END-PLAY

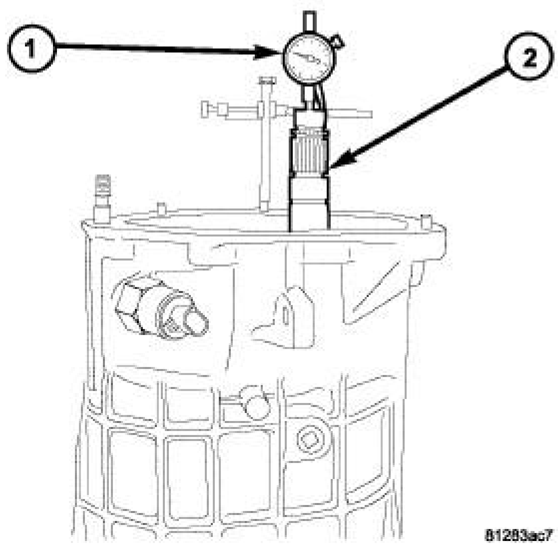

Fig. 6: Identifying Countershaft & Dial Indicator
Courtesy of CHRYSLER GROUP, LLC

1. Rotate countershaft several time to seat the bearings.
2. Screw Stud (special tool #8161, Adapter Rod) into the case.
3. Attach a dial indicator (1) to the stud and set dial indicator (1) plunger on the end of the countershaft (2).
4. Zero dial indicator, then pull up on the countershaft and record the dial indicator end-play measurement.
5. Subtract 0.0127 - 0.0889 mm (0.0005 - 0.0035 in.) from the recorded dial indicator end-play measurement. The remainder is the shim thickness needed behind the countershaft bearing cup in the front adapter.

REMOVAL

REMOVAL

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the exhaust. Refer to **CONVERTER, CATALYTIC, REMOVAL** .
3. Remove the drive shaft. Refer to **REMOVAL** .

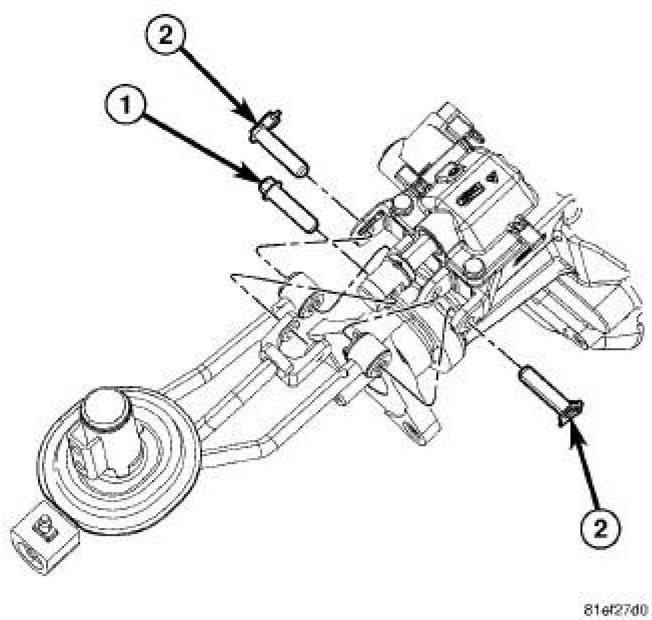

Fig. 7: Shift Linkage Bolt & Retaining Pins
Courtesy of CHRYSLER GROUP, LLC

4. Remove the shift linkage bolt (1) and the retaining pins (2), then separate the shift linkage from the transmission.

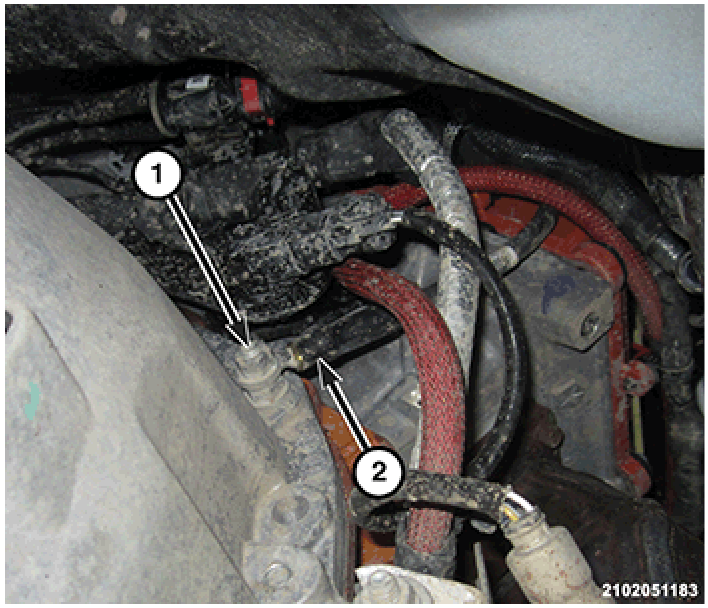

Fig. 8: Shift Linkage Bolt & Retaining Pins
Courtesy of CHRYSLER GROUP, LLC

5. Remove the ground wire nut (1) and position aside the ground wire (2).

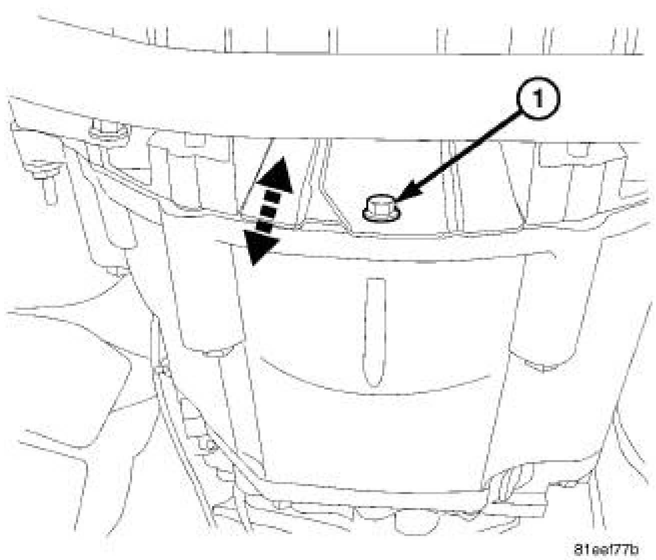

Fig. 9: Inspection Cover
Courtesy of CHRYSLER GROUP, LLC

6. Remove the inspection cover bolt (1) and the inspection cover.

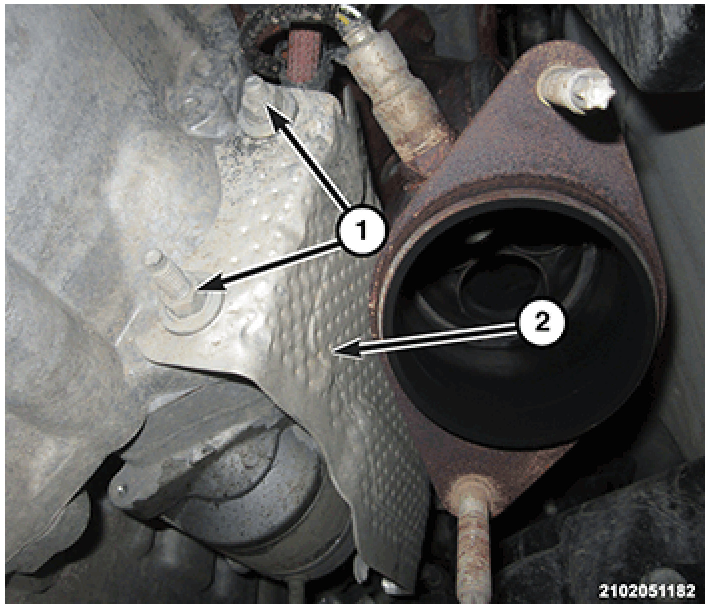

Fig. 10: Starter Heat Shield & Nuts
Courtesy of CHRYSLER GROUP, LLC

7. Remove the starter heat shield nuts (1) and the starter heat shield (2).

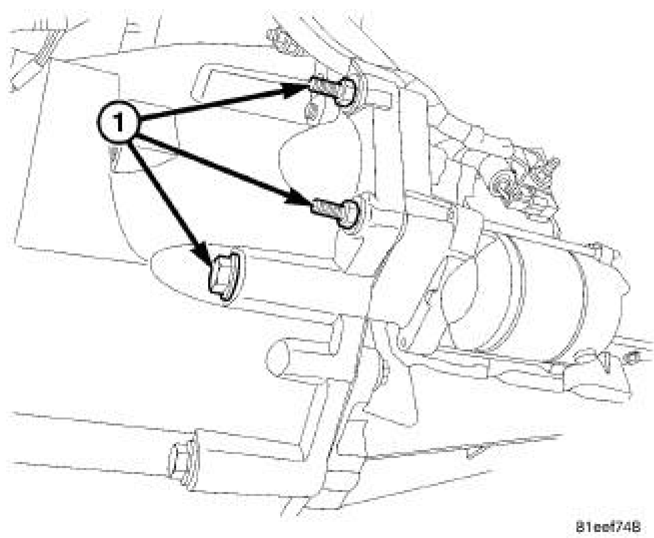

Fig. 11: Starter Bolts
Courtesy of CHRYSLER GROUP, LLC

8. Remove the starter bolts (1) and securely position the starter aside.

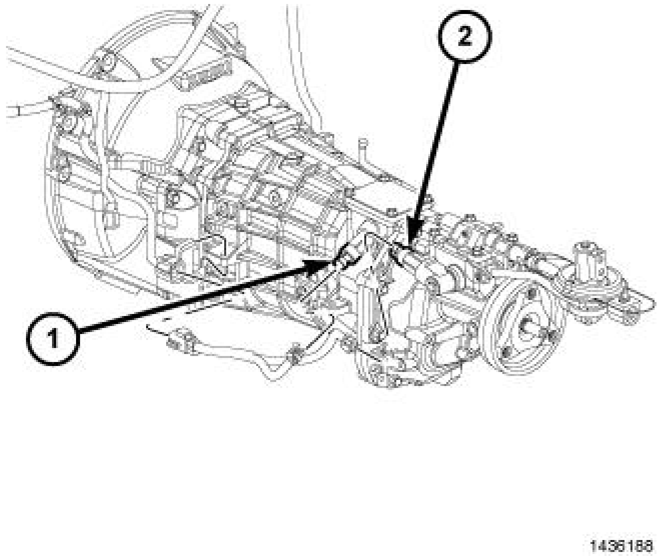

Fig. 12: Skip Shift & Reverse Lockout Solenoids
Courtesy of CHRYSLER GROUP, LLC

9. Disconnect the transmission skip shift solenoid wire harness connector (1) and the transmission reverse lockout solenoid wire harness connector (2).

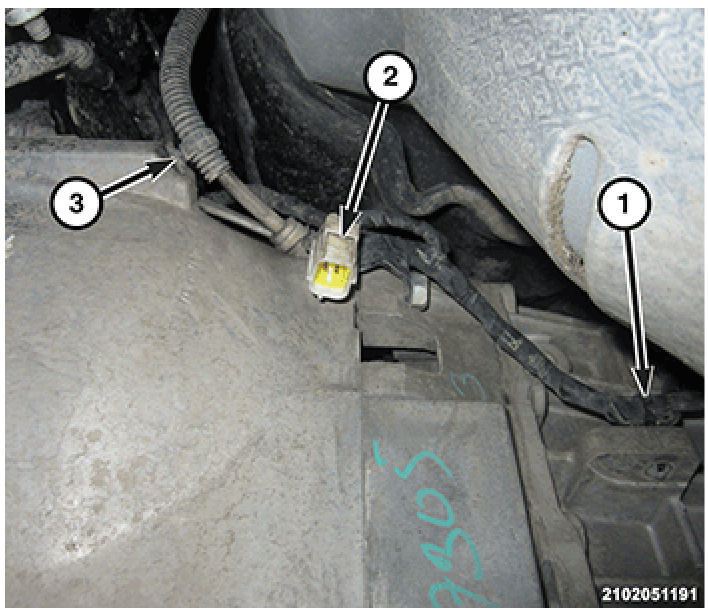

Fig. 13: Wire Harness Connector & Harness Clips
Courtesy of CHRYSLER GROUP, LLC

10. Remove push pin wiring connectors (1 and 2) and the clutch hydraulic tube push pin (3) from the transmission.

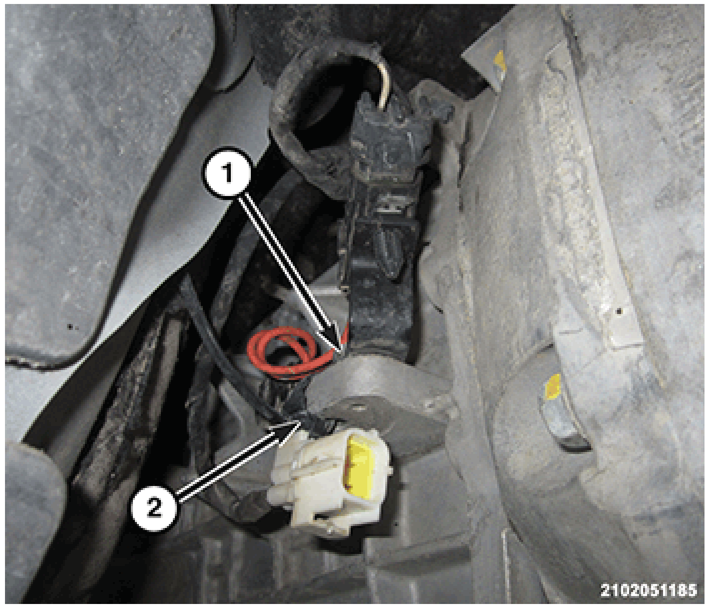

Fig. 14: Push Pin Wiring Connectors
Courtesy of CHRYSLER GROUP, LLC

11. Remove push pin wiring connectors (1 and 2) from the transmission.

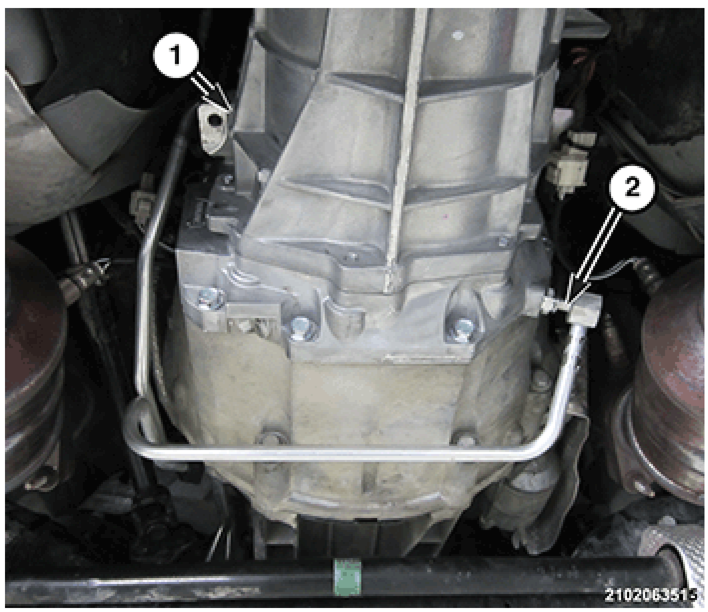

Fig. 15: Transmission Cooler Lines
Courtesy of CHRYSLER GROUP, LLC

12. Disconnect the transmission cooler lines (1 and 2) from the transmission. (Refer to **STANDARD PROCEDURE**).

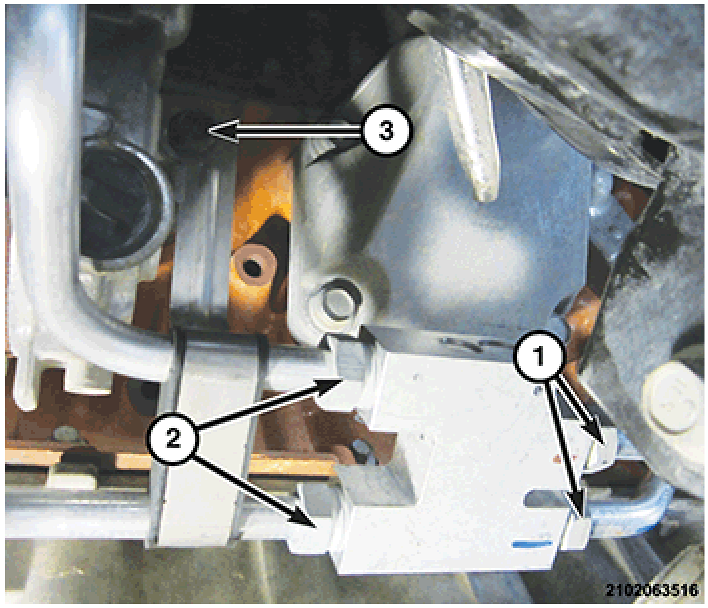

Fig. 16: Transmission Cooler Lines & Bracket Bolt
Courtesy of CHRYSLER GROUP, LLC

13. Disconnect the transmission cooler lines (1) from the thermal bypass valve and remove the rear transmission cooler lines from the vehicle.

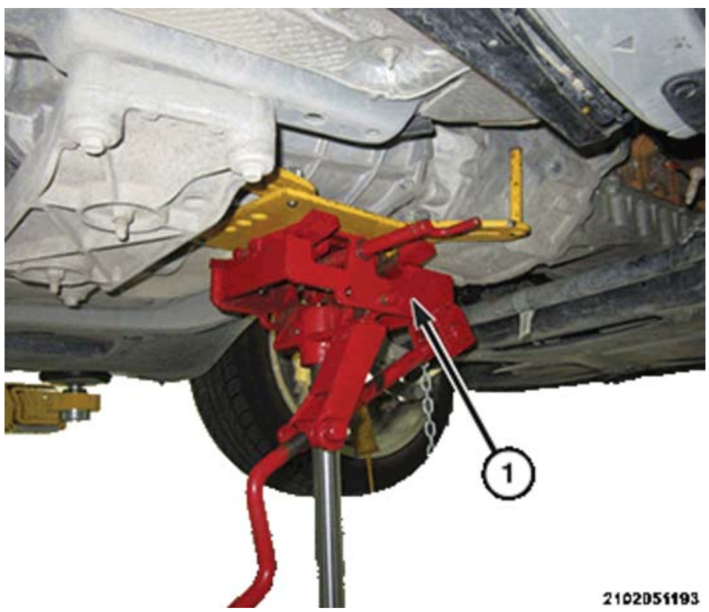

Fig. 17: Transmission Jack
Courtesy of CHRYSLER GROUP, LLC

14. Raise the transmission slightly with the transmission jack (1) and relieve the load on the crossmember.

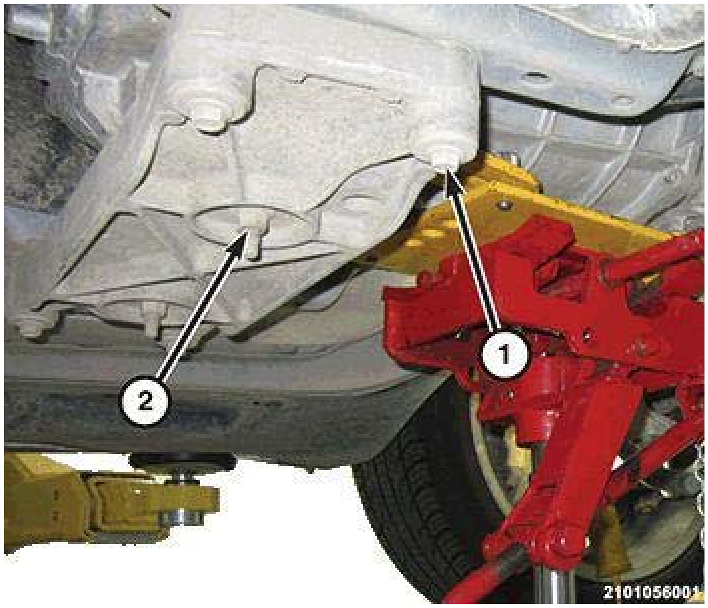

Fig. 18: Rear Cross Member & Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

15. Remove the crossmember bolts (1).

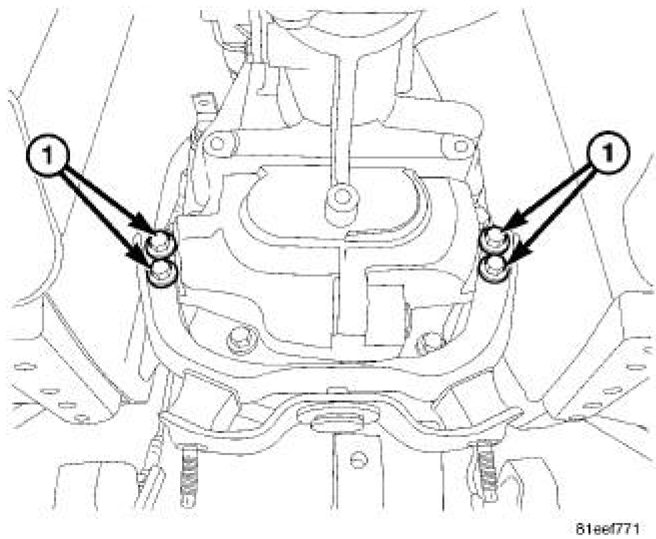

Fig. 19: Transmission Isolator Bracket Upper Bolts
Courtesy of CHRYSLER GROUP, LLC

16. Remove the isolator bracket bolts (1).
17. Remove the crossmember, isolator bracket and isolator from the transmission.

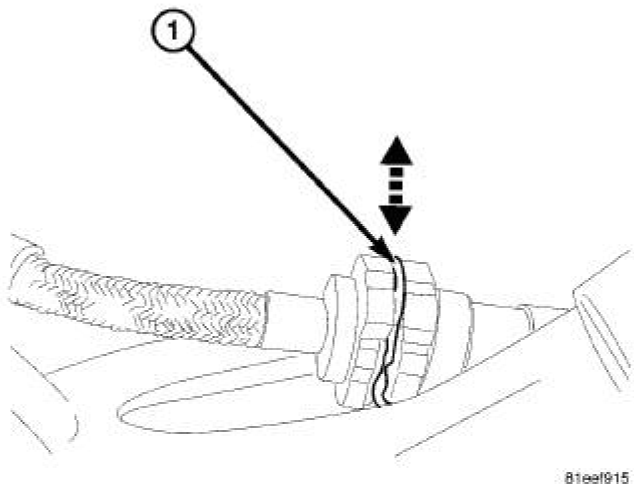

Fig. 20: Clutch Hose Removal
Courtesy of CHRYSLER GROUP, LLC

18. Raise the clip (1) securing the clutch hydraulic hose to the throw out bearing assembly. Remove and cap the clutch hydraulic hose.

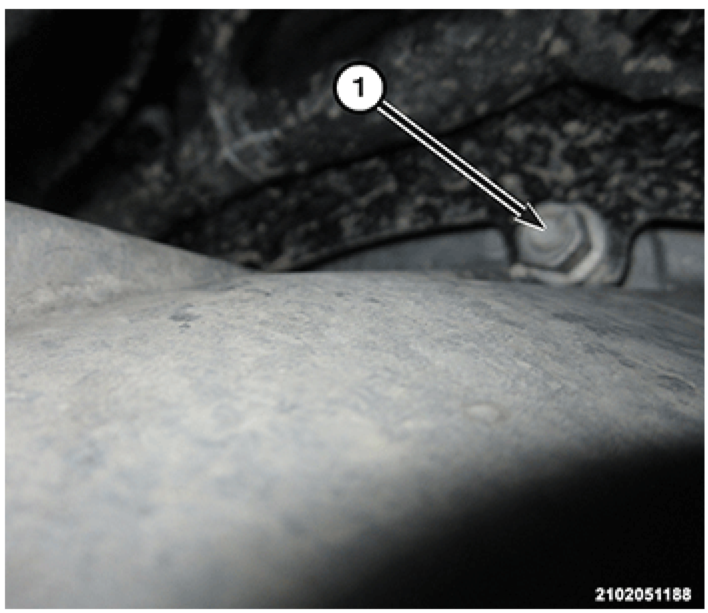

Fig. 21: Rainbow Bracket Nut
Courtesy of CHRYSLER GROUP, LLC

19. Remove the rainbow bracket nut (1).

Fig. 22: Rainbow Bracket Nut
Courtesy of CHRYSLER GROUP, LLC

20. Remove the rainbow bracket nut (1).

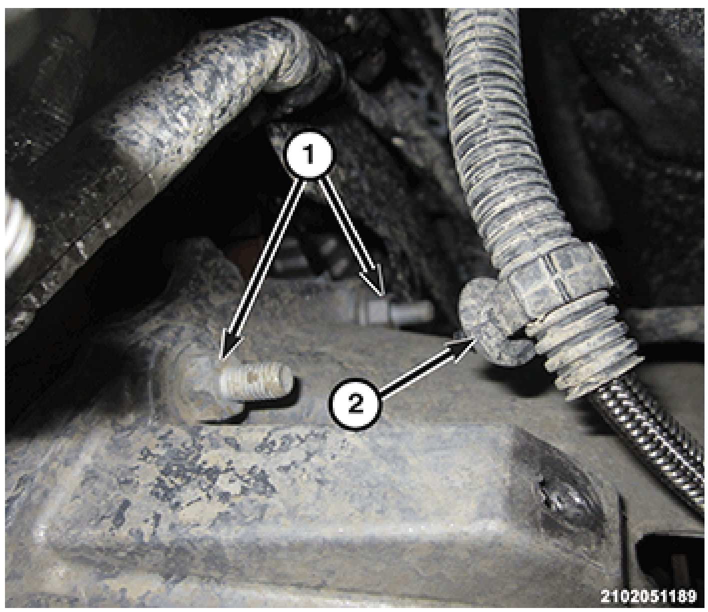

Fig. 23: Engine Stud Bolts & Harness Clip
Courtesy of CHRYSLER GROUP, LLC

21. Remove the top three (two shown) transmission to engine stud bolts (1).

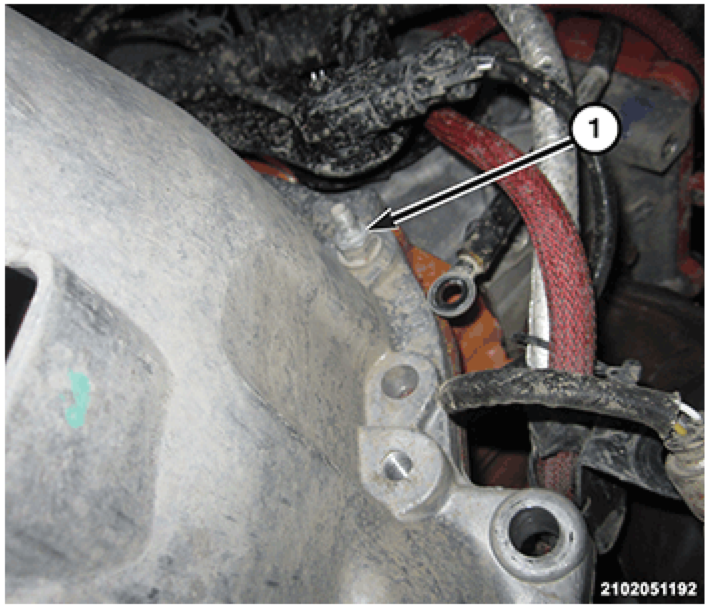

Fig. 24: Engine Stud Bolt
Courtesy of CHRYSLER GROUP, LLC

22. Remove the top transmission to engine stud bolt (1).

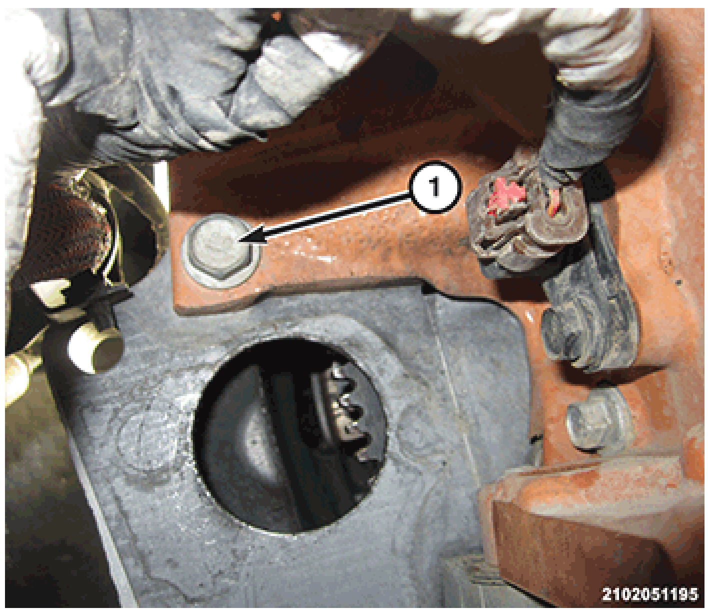

Fig. 25: Front Transmission To Engine Bolt
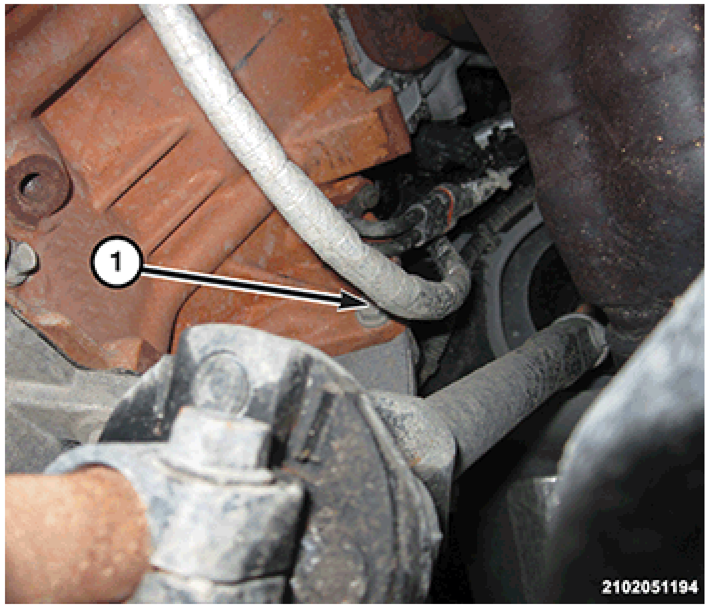
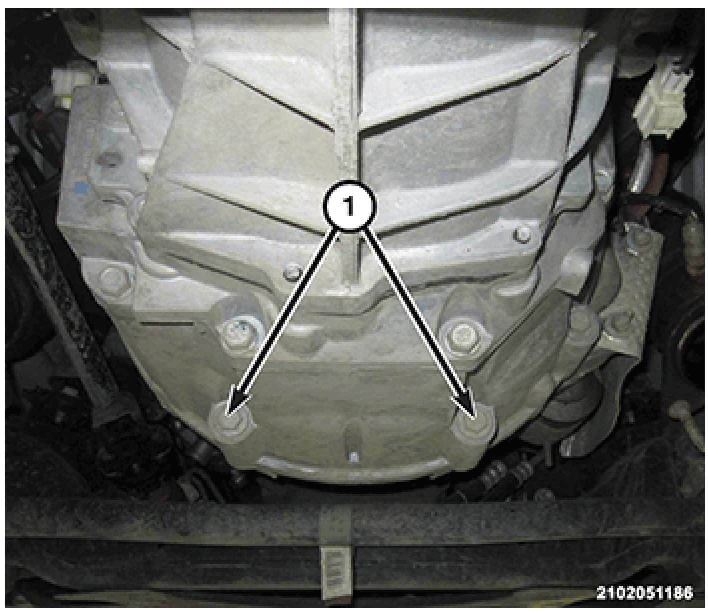
Courtesy of CHRYSLER GROUP, LLC

23. Remove the front transmission to engine bolt (1).



[Fig. 26: Front Transmission To Engine Bolt]()
Courtesy of CHRYSLER GROUP, LLC

24. Remove the front transmission to engine bolt (1).



[Fig. 27: Bottom Transmission To Oil Pan Bolts]()
Courtesy of CHRYSLER GROUP, LLC

25. Remove the bottom transmission to oil pan bolts (1).
26. Slide transmission back so that the input shaft clears pressure plate
27. Remove the transmission from the vehicle.

DISASSEMBLY

DISASSEMBLY

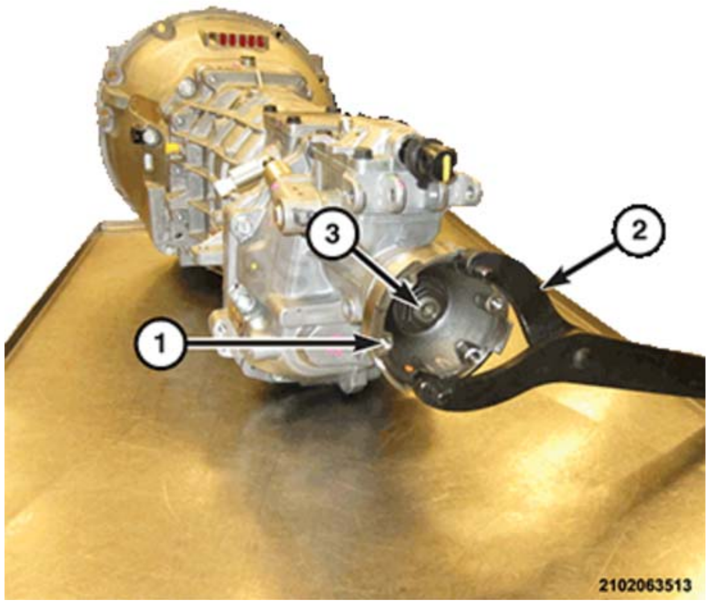


Fig. 28: Output Flange, Special Tool & Locknut
Courtesy of CHRYSLER GROUP, LLC

1. Hold the output flange (1) with Special Tool (special tool #C-3281, Holder, Flange) Flange Holder (2) while removing the output flange locknut (3).

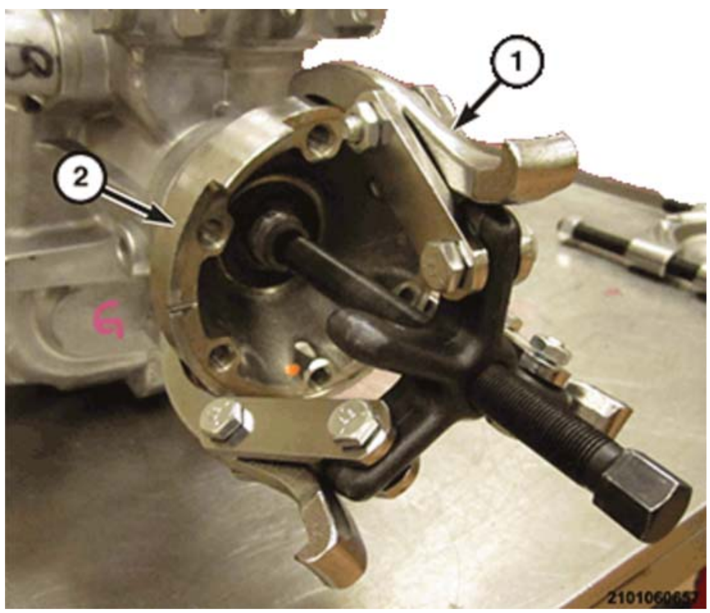

Fig. 29: Three Jaw Puller & Output Flange
Courtesy of CHRYSLER GROUP, LLC

2. Using a three jaw puller (1) or equivalent, remove the output flange (2) from the transmission output shaft.

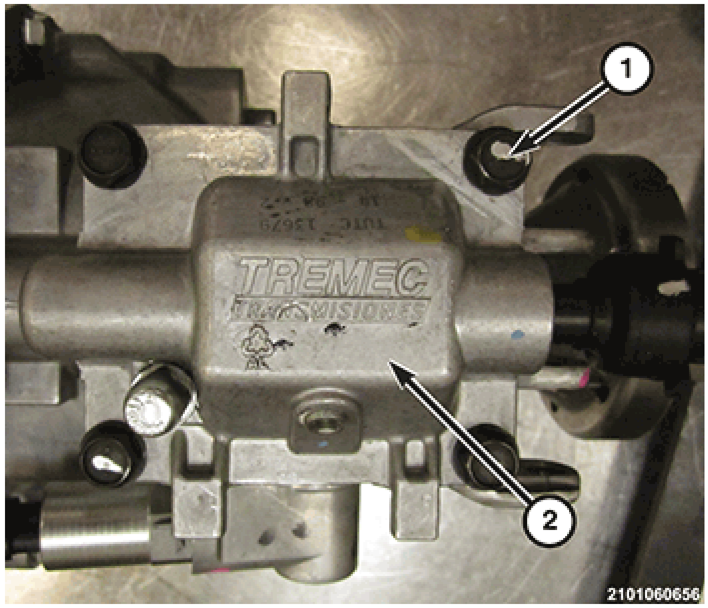

Fig. 30: Shift Cover & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Remove the shift cover (1) bolts (2) and remove the cover (2).

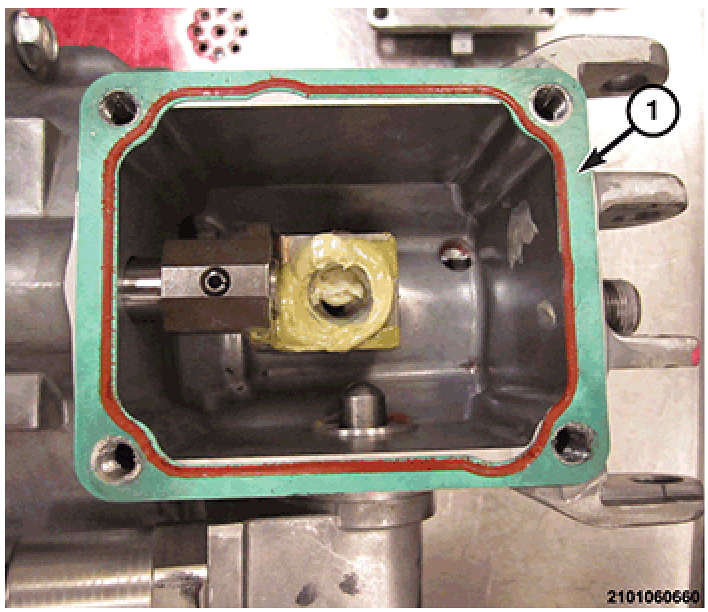

Fig. 31: Shift Cover Gasket
Courtesy of CHRYSLER GROUP, LLC

4. Remove the shift cover gasket (1).

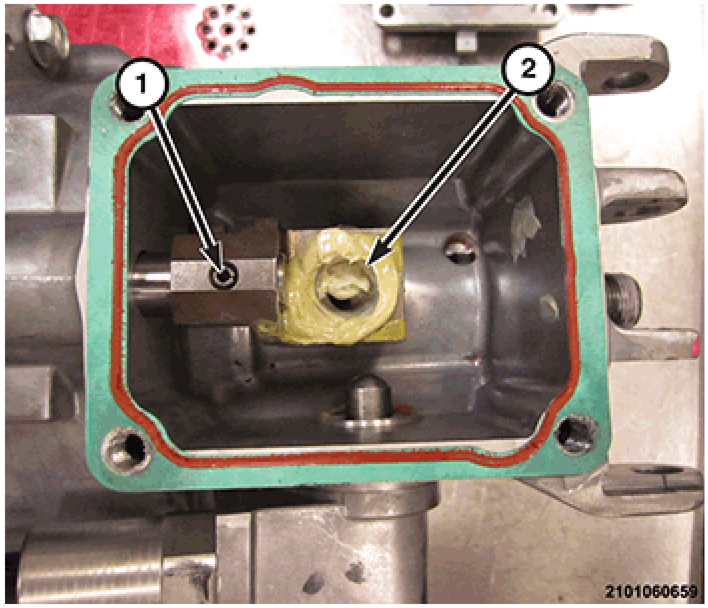

Fig. 32: Offset Lever & Roll Pin
Courtesy of CHRYSLER GROUP, LLC

5. Remove the offset lever (2) roll pin (1) with a hammer and punch and remove the offset lever.

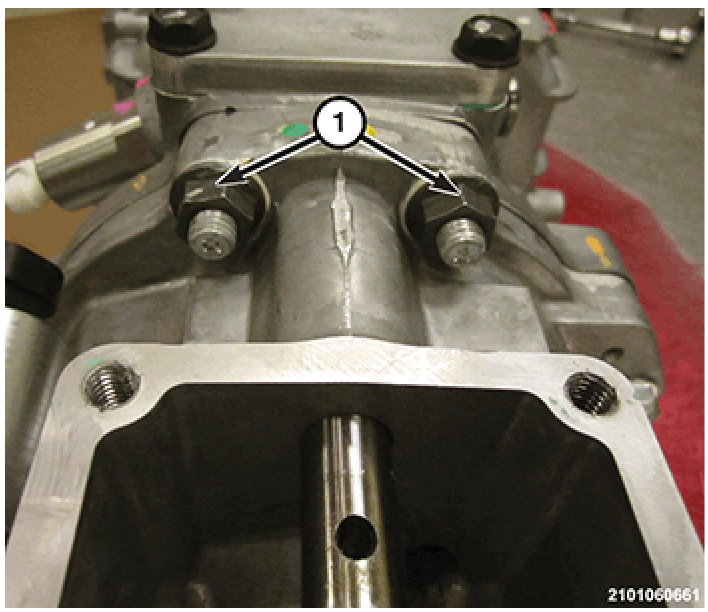

Fig. 33: Extension Housing Nuts
Courtesy of CHRYSLER GROUP, LLC

6. Remove the extension housing nuts (1) from the transmission studs.

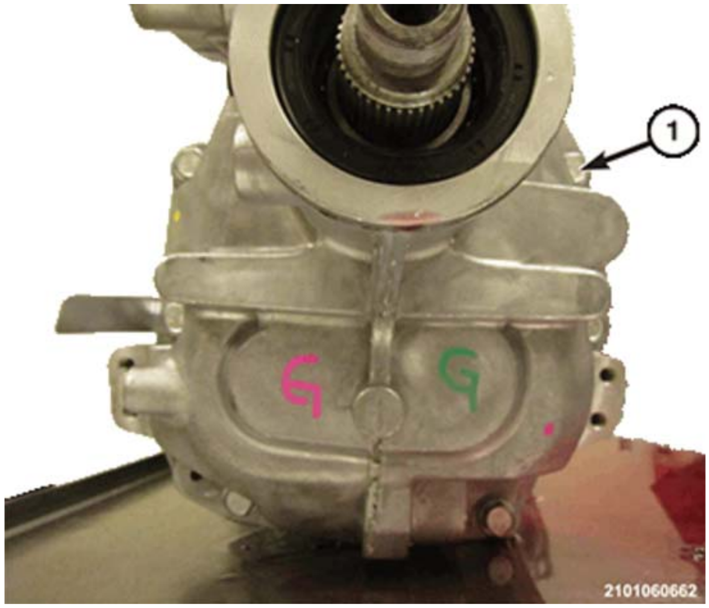

Fig. 34: Extension Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Remove the extension housing bolts (1).

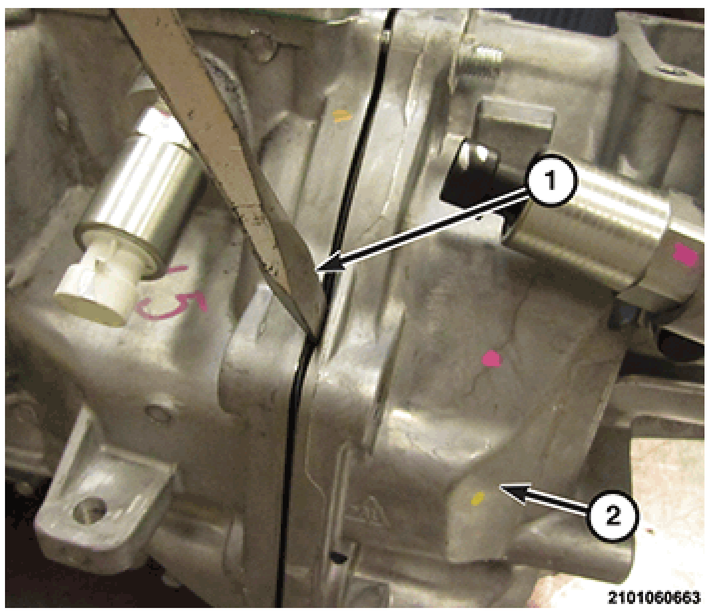

Fig. 35: Prying Extension Housing Off Transmission Case At Pry Points
Courtesy of CHRYSLER GROUP, LLC

8. Pry the extension housing (2) off of the transmission case at the pry points (1).

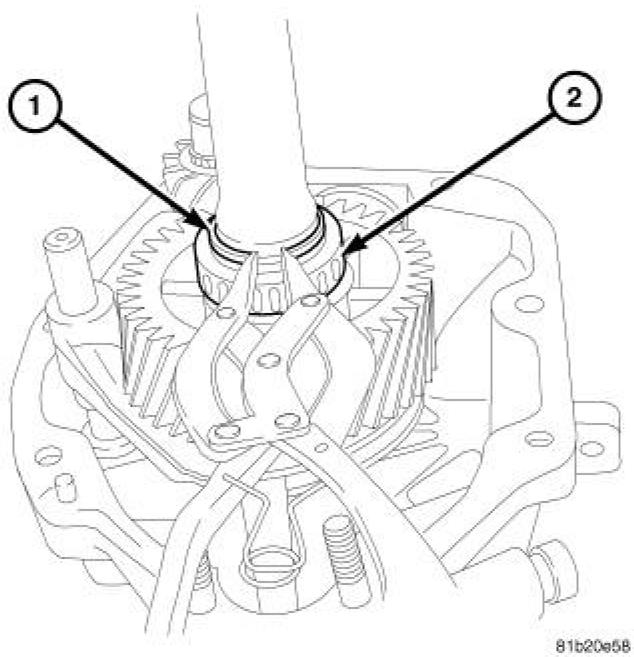

Fig. 36: Roller Bearing Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

9. Stand the transmission on Fixture (special tool #9387, Fixture, Transmission Holding) and bolt the adapter to the fixture.
10. Install on bench Fixture (special tool #9385, Holding Fixture, Bench Mount).
11. Remove the mainshaft roller bearing (2) snap ring (1).

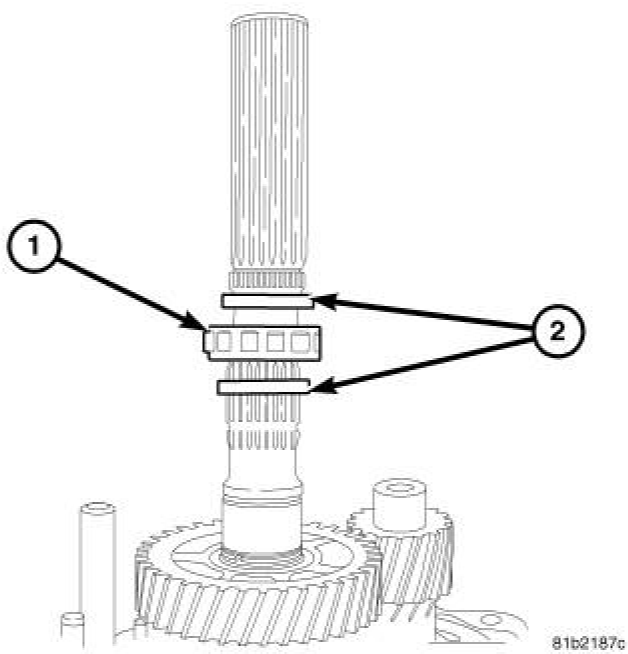

Fig. 37: Roller Bearing & Spacers
Courtesy of CHRYSLER GROUP, LLC

12. Remove the mainshaft roller bearing (1) and spacers (2) from the mainshaft.

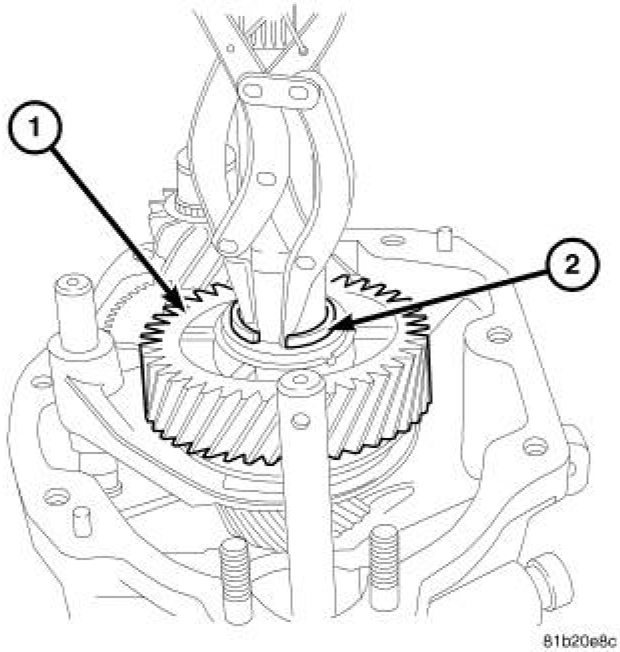

Fig. 38: Reverse Gear Snap Ring
Courtesy of CHRYSLER GROUP, LLC

13. Remove the reverse gear (1) snap ring (2) from the mainshaft.

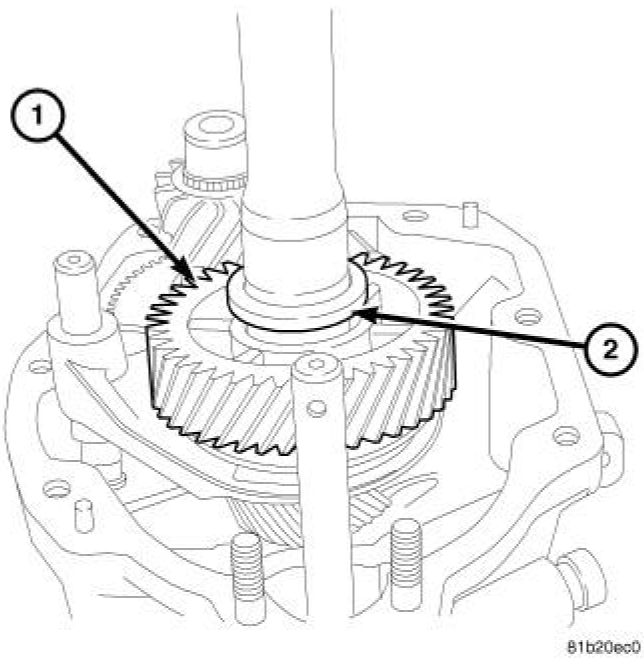

Fig. 39: Reverse Gear Thrust Washer
Courtesy of CHRYSLER GROUP, LLC

14. Remove the reverse gear (1) thrust washer (2) from the mainshaft.

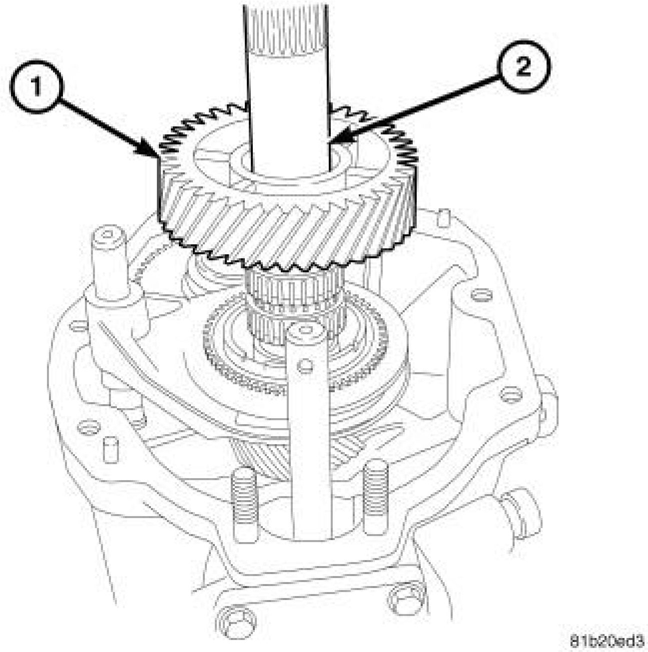

Fig. 40: Reverse Gear & Mainshaft
Courtesy of CHRYSLER GROUP, LLC

15. Remove the reverse gear (1) from the mainshaft (2).

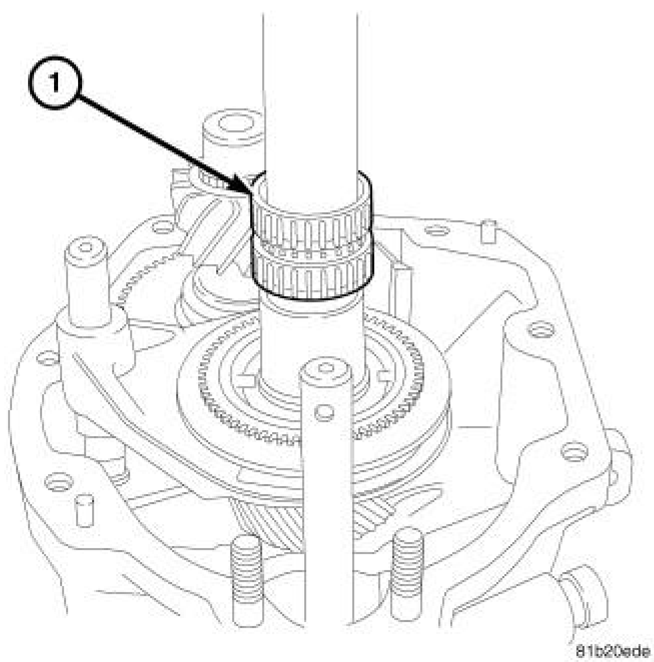

Fig. 41: Reverse Gear Bearing
Courtesy of CHRYSLER GROUP, LLC

16. Remove the reverse gear bearing (1) from the mainshaft (2).

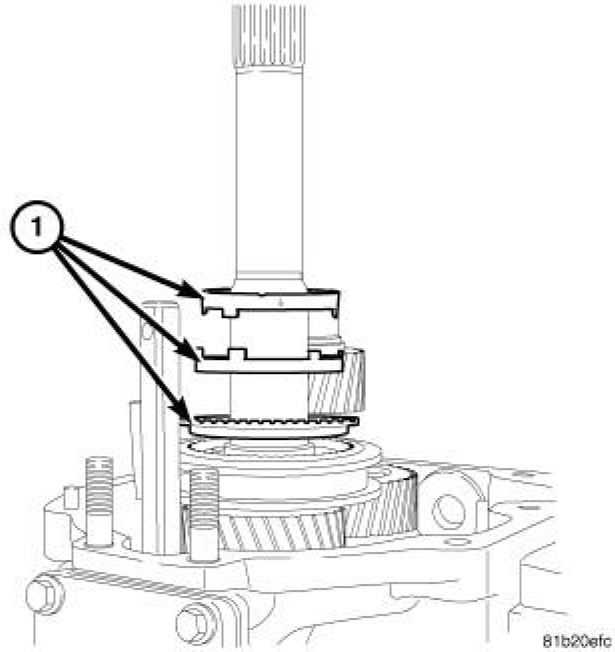

Fig. 42: Reverse Synchronizer Rings
Courtesy of CHRYSLER GROUP, LLC

17. Remove the reverse gear synchronizer rings (1) from the reverse gear synchronizer hub.

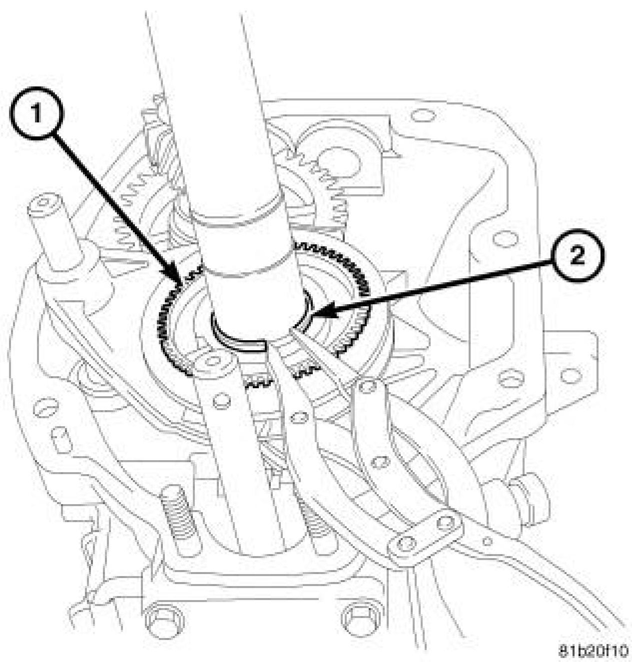

Fig. 43: Reverse Synchronizer Snap Ring
Courtesy of CHRYSLER GROUP, LLC

18. Remove the reverse gear synchronizer hub (1) snap ring (2) from the mainshaft.

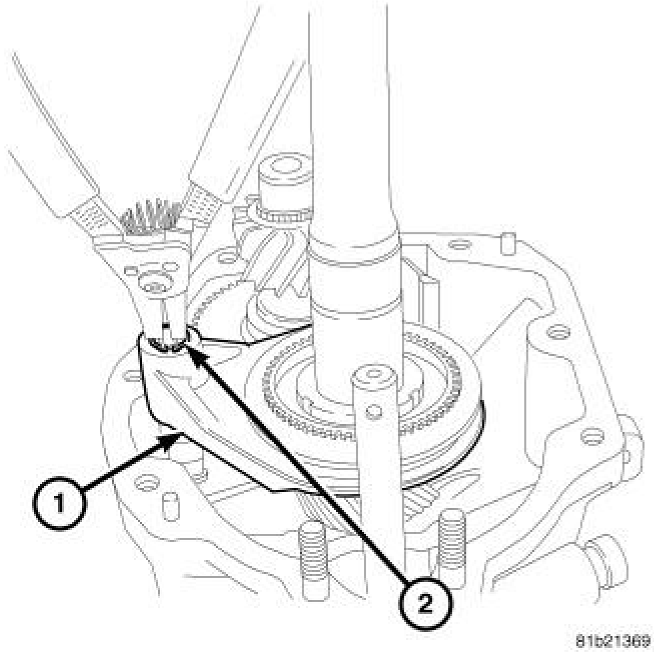

Fig. 44: Reverse Fork Snap Ring
Courtesy of CHRYSLER GROUP, LLC

19. Remove the reverse gear shift fork (1) snap ring (2) from the shift rail and discard the snap ring.

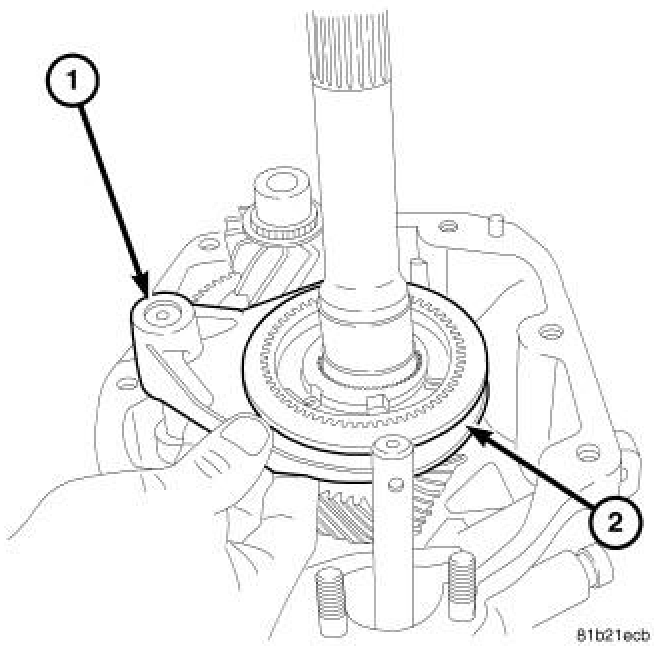

Fig. 45: Reverse Hub & Fork
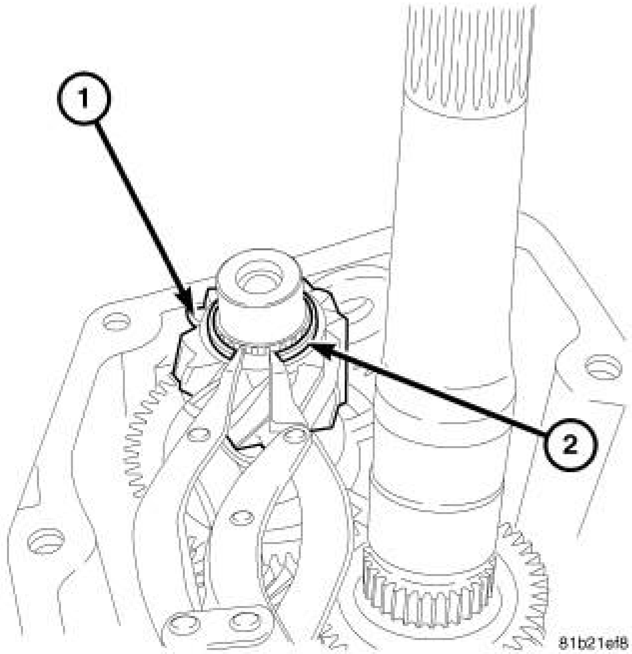
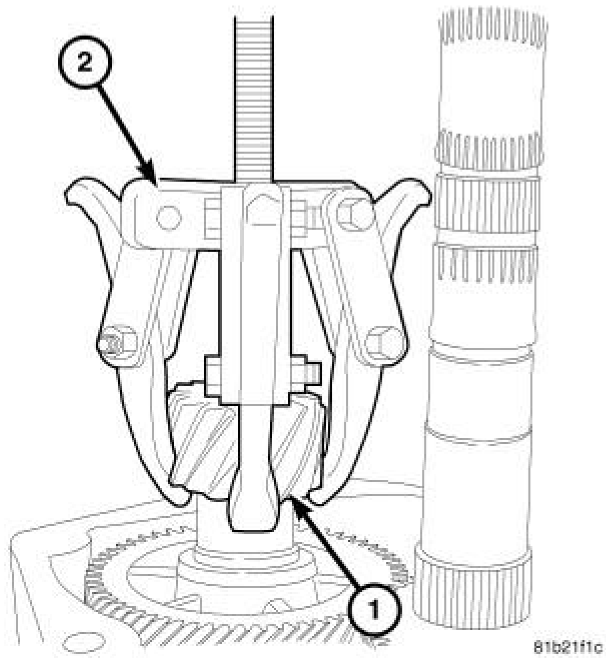
Courtesy of CHRYSLER GROUP, LLC

20. Remove the reverse gear shift fork (1) synchronizer hub and sleeve as an assembly (2).



[Fig. 46: Reverse Countershaft Snap Ring](#)
Courtesy of CHRYSLER GROUP, LLC

21. Remove the reverse gear (1) snap ring (2) from the countershaft.



[Fig. 47: Reverse Countershaft Gear](#)
Courtesy of CHRYSLER GROUP, LLC

22. Remove the reverse gear from the countershaft (1) with a suitable three jaw puller (2) and Button (special tool #10027, Button, Press).

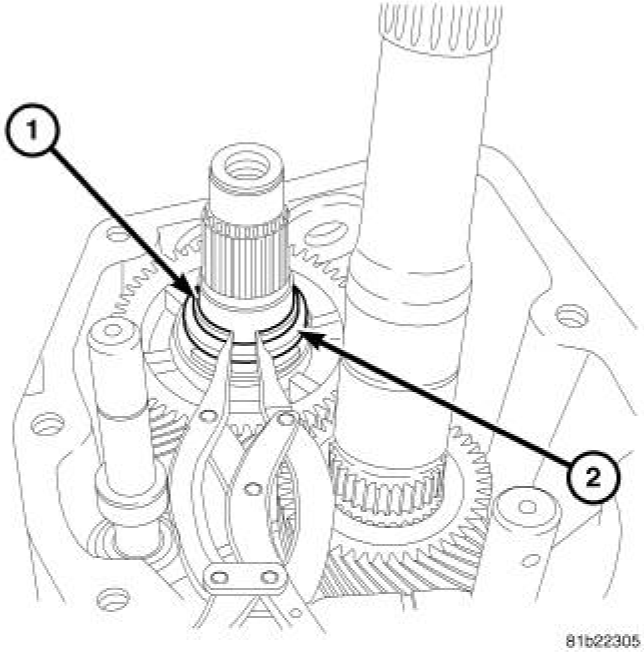


Fig. 48: 5th Gear Snap Ring & Countershaft
Courtesy of CHRYSLER GROUP, LLC

23. Remove the fifth gear snap ring (1) from the countershaft (2).

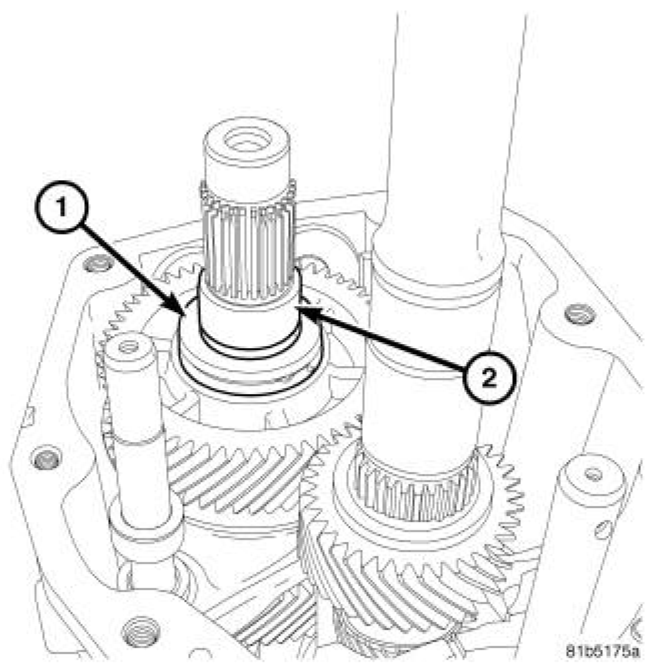

Fig. 49: 5th Gear Thrust Washer & Countershaft
Courtesy of CHRYSLER GROUP, LLC

24. Remove the fifth gear thrust washer (1) from the countershaft (2).

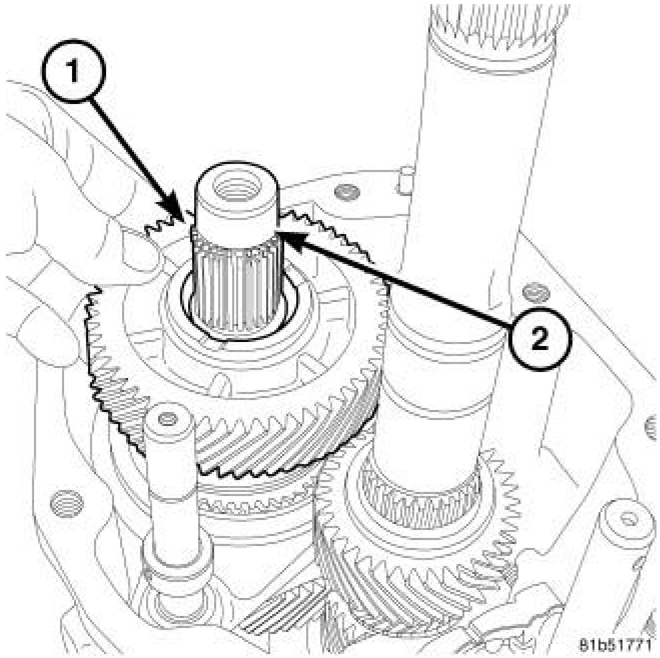

Fig. 50: 5th Gear & Countershaft
Courtesy of CHRYSLER GROUP, LLC

25. Remove the fifth gear (1) from the countershaft (2).

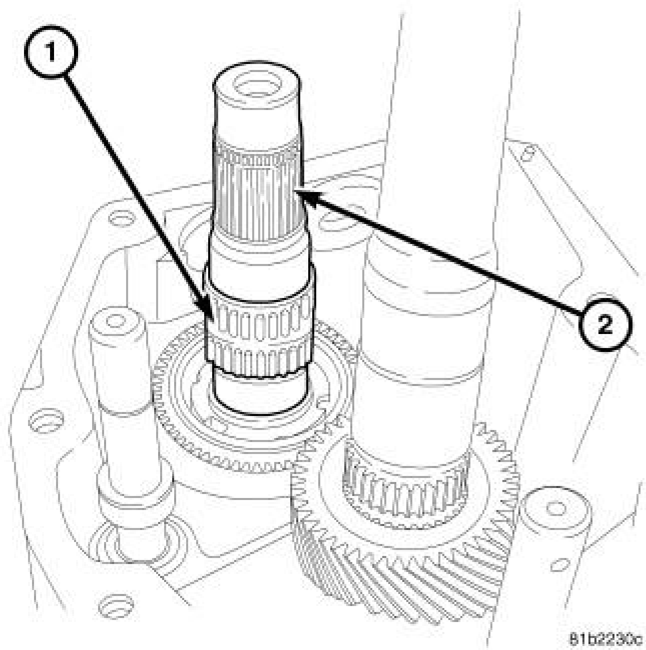

Fig. 51: 5th Gear Bearing & Countershaft
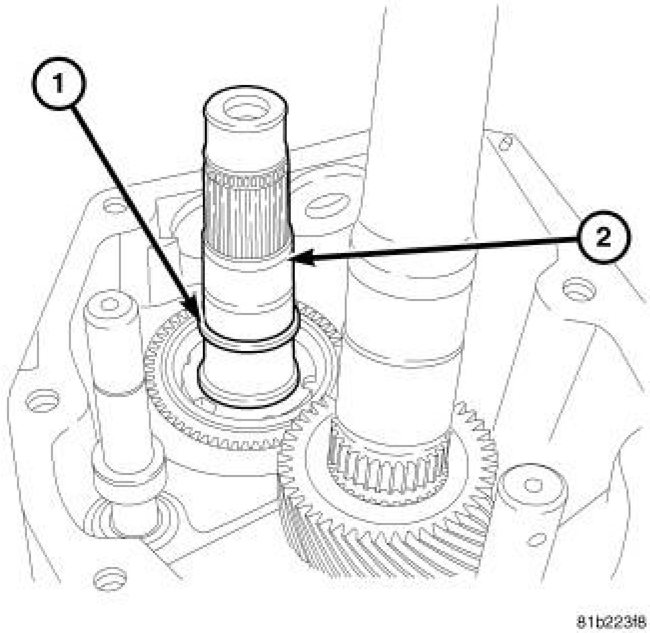
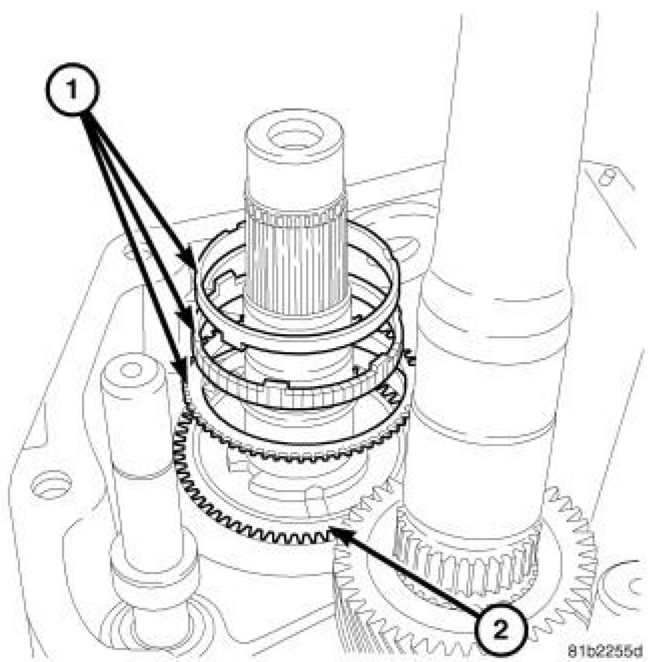
Courtesy of CHRYSLER GROUP, LLC

26. Remove the fifth gear bearing (1) from the countershaft (2).



[Fig. 52: 5th Gear Bearing Spacer & Countershaft](#)
Courtesy of CHRYSLER GROUP, LLC

27. Remove the fifth gear bearing spacer (1) from the countershaft (2).



[Fig. 53: Fifth Gear Synchro Rings & 5-6 Synchronizer Hub](#)
Courtesy of CHRYSLER GROUP, LLC

28. Remove the fifth gear synchronizer rings (1) from the fifth and sixth gear synchronizer hub (2).

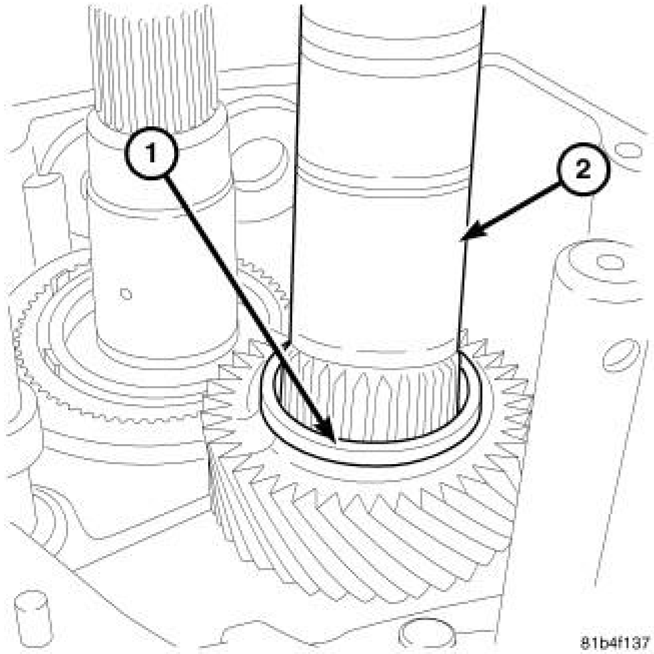


Fig. 54: 5th Gear Retainer Ring & Mainshaft
Courtesy of CHRYSLER GROUP, LLC

29. Remove the fifth gear split ring retainer (1) from the mainshaft (2).

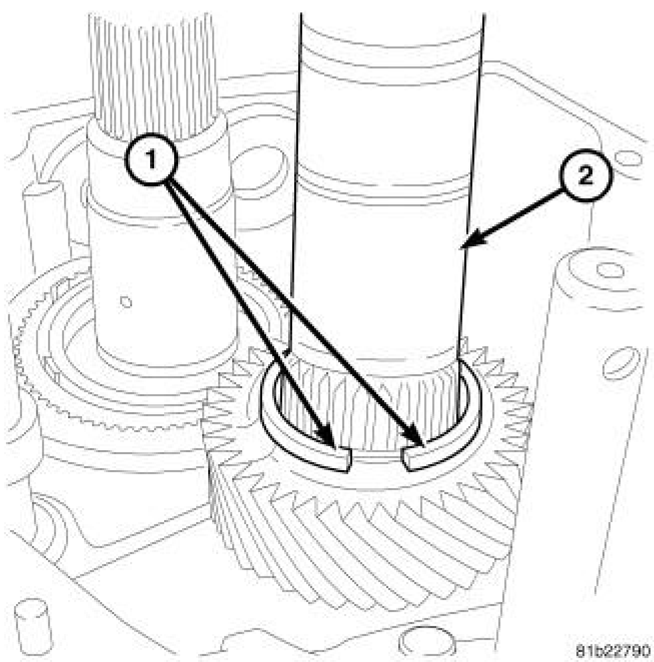

Fig. 55: 5th Gear Split Rings & Mainshaft
Courtesy of CHRYSLER GROUP, LLC

30. Remove fifth gear split rings (1) from mainshaft (2).

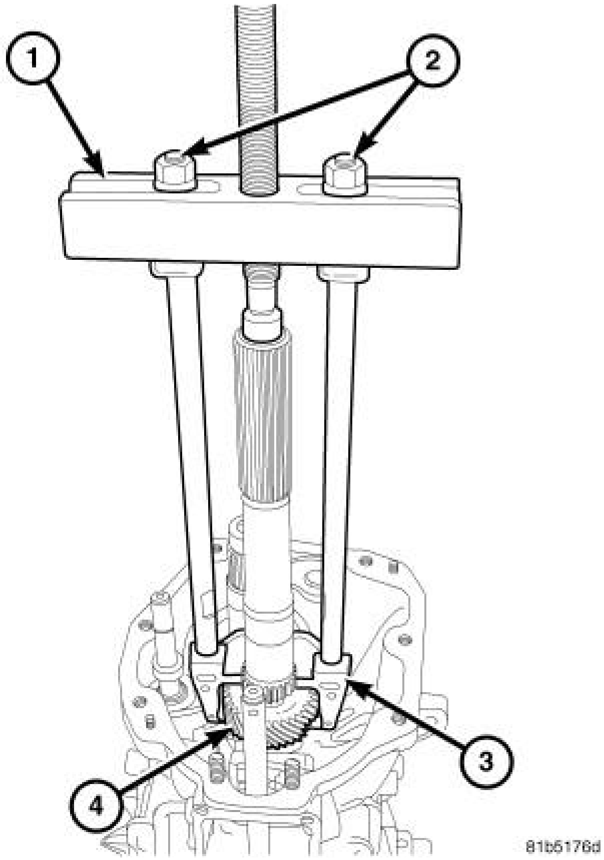

Fig. 56: 5th Gear Puller
Courtesy of CHRYSLER GROUP, LLC

31. Remove the fifth gear (4) from the mainshaft with Bridge (special tool #9382, Bridge) (1), Bolts (special tool #9378, Bolts, Puller) (2), Puller (special tool #9379a, Remover, Gear) (3), and Button (special tool #10027, Button, Press).

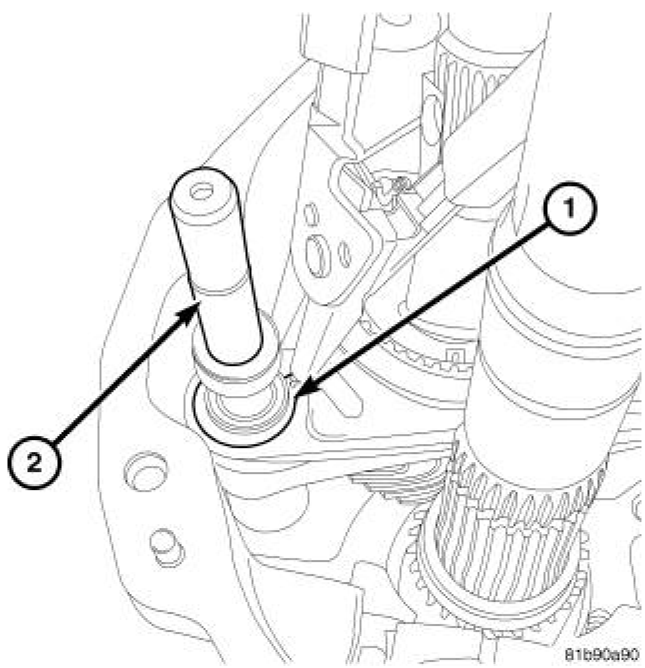

Fig. 57: 5-6 Shift Fork Snap Ring
Courtesy of CHRYSLER GROUP, LLC

32. Remove fifth and sixth gear shift fork snap ring (1) from the shift rail (2).

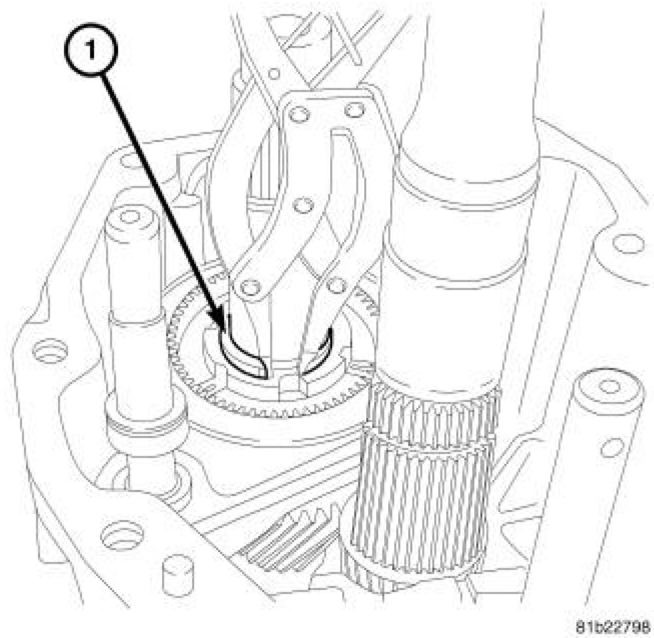

Fig. 58: 5-6 Hub Snap Ring
Courtesy of CHRYSLER GROUP, LLC

33. Remove the fifth and sixth gear synchronizer hub snap ring (1) from the countershaft.

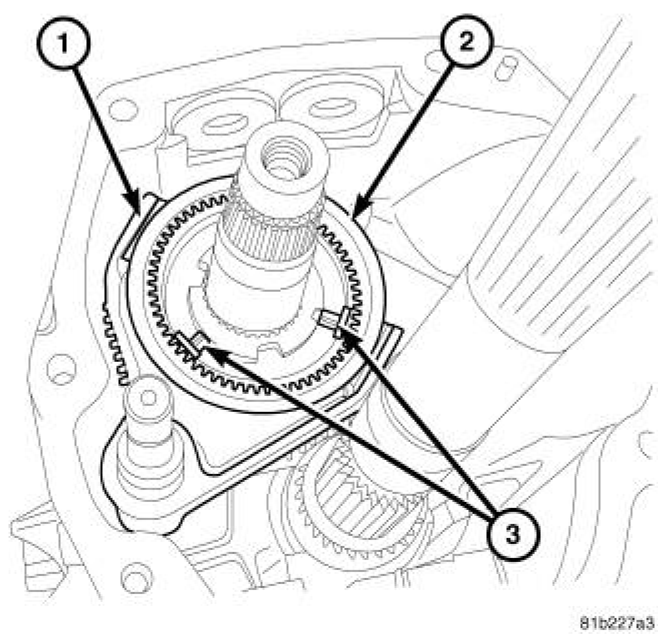

Fig. 59: 5-6 Fork & Sleeve
Courtesy of CHRYSLER GROUP, LLC

34. Remove the fifth and sixth gear shift fork (1), synchronizer sleeve (2), and detents (3) from the fifth and sixth gear synchronizer hub.

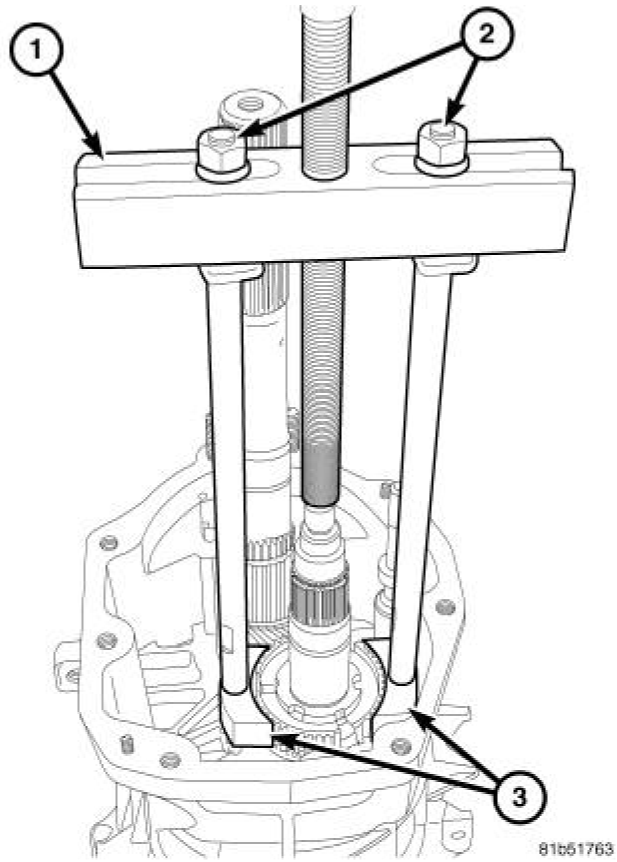

Fig. 60: 5-6 Hub Puller
Courtesy of CHRYSLER GROUP, LLC

35. Remove the fifth and sixth gear synchronizer hub from the countershaft with Bridge (special tool #9382, Bridge) (1), Bolts (special tool #9378, Bolts, Puller) (2), Puller (special tool #10026, Puller, Synchro Hub) (3) and Button (special tool #10027, Button, Press).

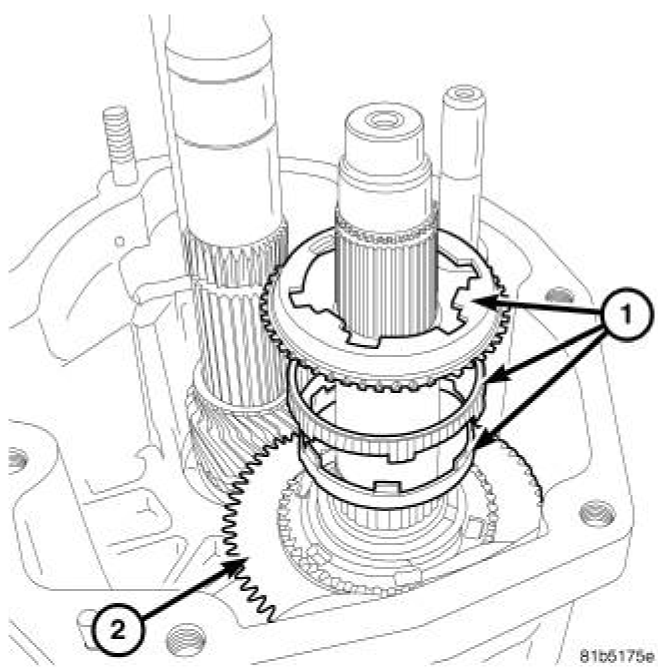

Fig. 61: 6th Synchro Rings
Courtesy of CHRYSLER GROUP, LLC

36. Remove the sixth gear synchronizer rings (1) from the sixth gear (2).

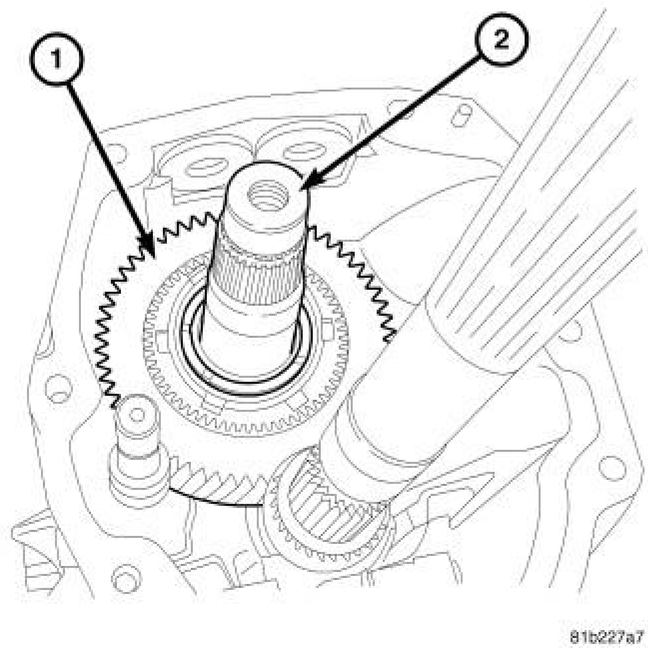

Fig. 62: 6th Gear & Countershaft
Courtesy of CHRYSLER GROUP, LLC

37. Remove the sixth gear (1) from the countershaft (2).

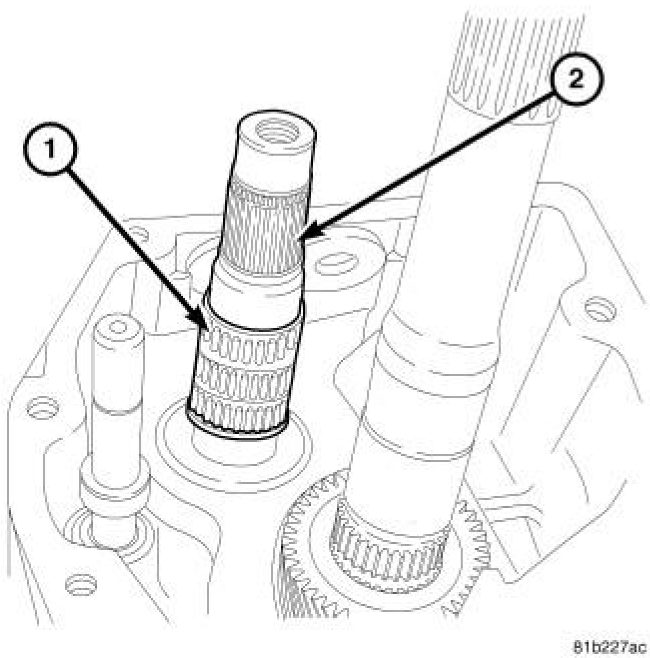

Fig. 63: 6th Gear Bearing & Countershaft
Courtesy of CHRYSLER GROUP, LLC

38. Remove the sixth gear bearing (1) from the countershaft (2).

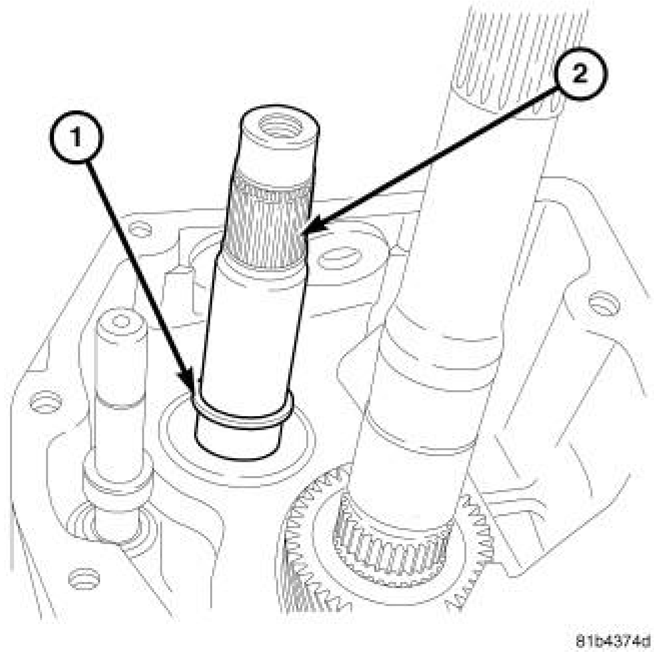

Fig. 64: 6th Gear Bearing Spacer & Countershaft
Courtesy of CHRYSLER GROUP, LLC

39. Remove the sixth gear bearing spacer (1) from the countershaft (2).

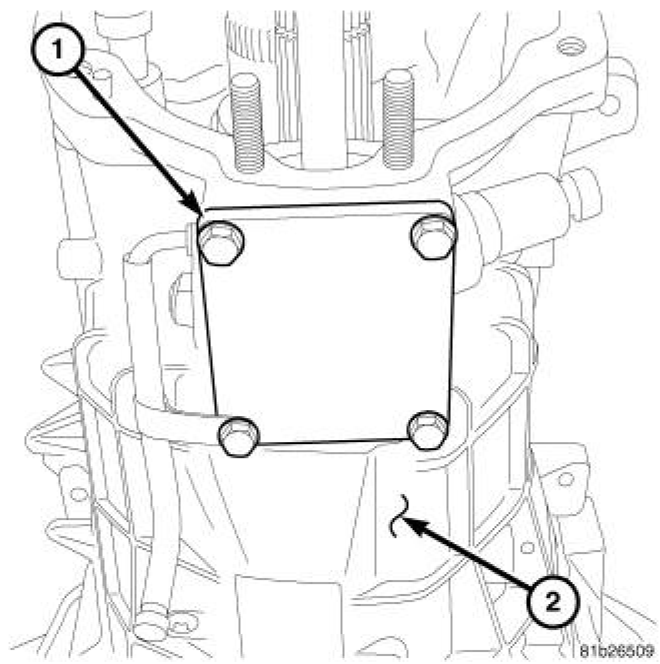

Fig. 65: Top Cover, Bolts & Transmission Case
Courtesy of CHRYSLER GROUP, LLC

40. Remove the top cover (1) bolts and remove the cover from the transmission case (2).

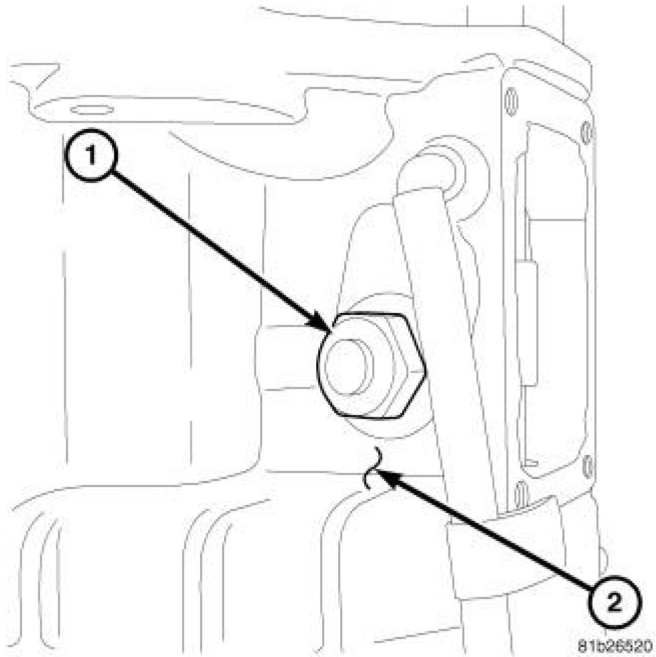

Fig. 66: Shift Detent & Right Side Of Case
Courtesy of CHRYSLER GROUP, LLC

41. Remove the shift detent (1) from the right side of the case (2).

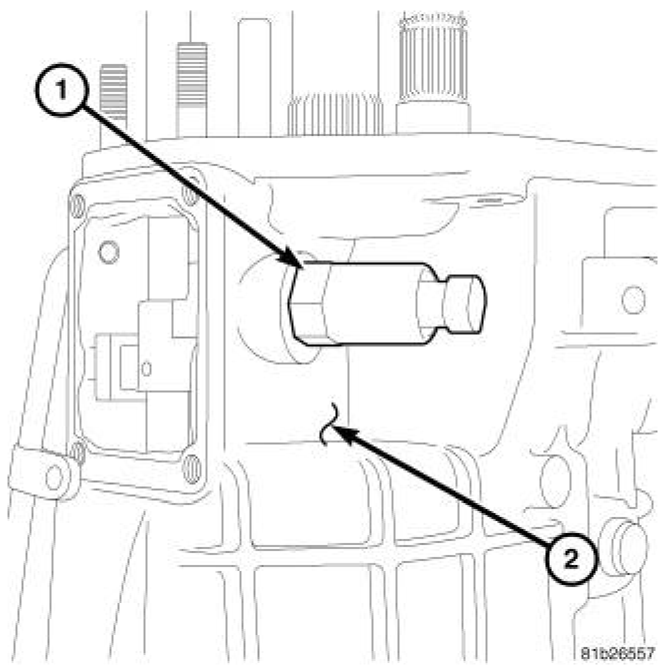

Fig. 67: Skip Shift Solenoid & Left Side Of Case
Courtesy of CHRYSLER GROUP, LLC

42. Remove the skip shift solenoid (1) from the left side of the case (2).

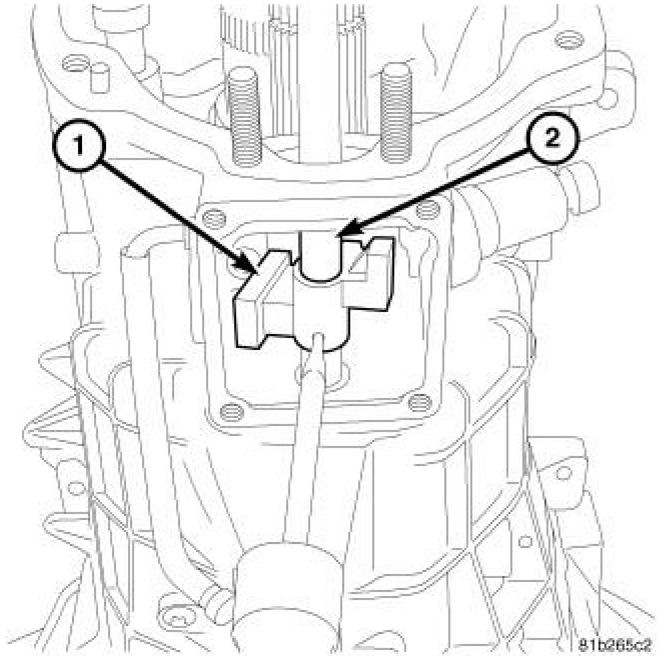

Fig. 68: Skip Shift Lever & Shift Rail
Courtesy of CHRYSLER GROUP, LLC

43. Drive the skip shift lever (1) roll pin down with a punch until the lever is loose from the shift rail (2).

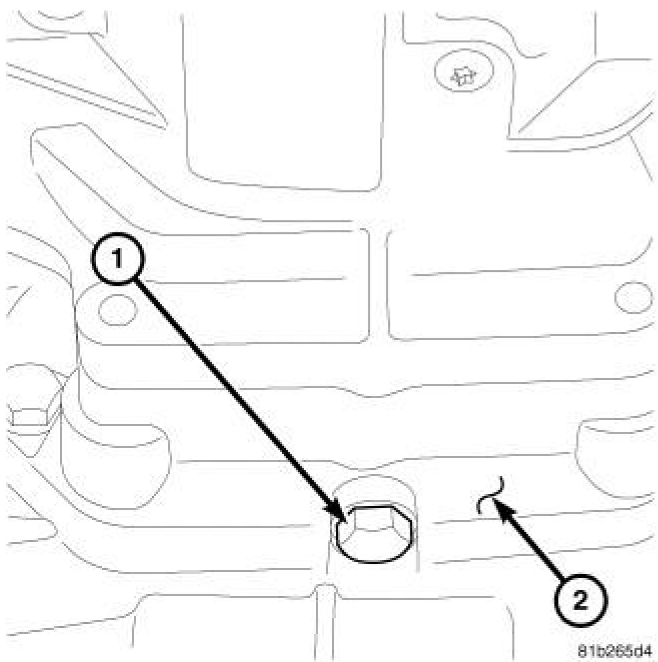

Fig. 69: Roller Detent Bolt & Transmission Adapter
Courtesy of CHRYSLER GROUP, LLC

44. Remove the roller detent bolt (1) from the transmission adapter (2).

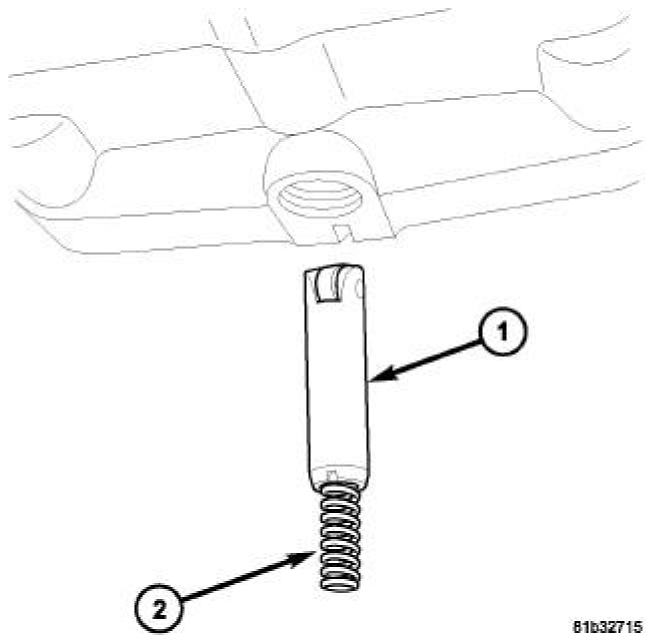

Fig. 70: Detent & Spring
Courtesy of CHRYSLER GROUP, LLC

45. Remove the roller detent (1) and spring (2) from the transmission adapter.

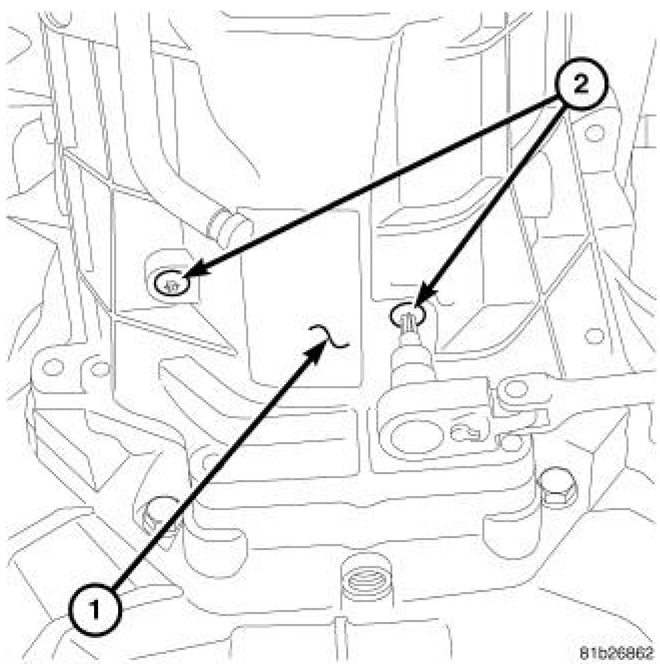

Fig. 71: Torx Screws
Courtesy of CHRYSLER GROUP, LLC

46. Remove the shift lever guide bolts (1) from the top of the transmission case (2).

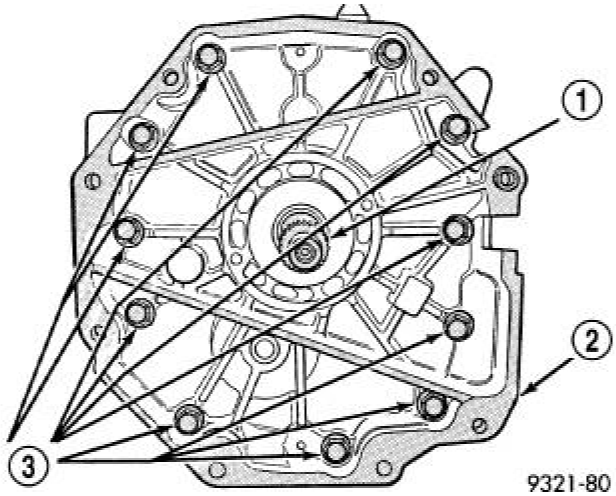

Fig. 72: Adapter Bolts Location
Courtesy of CHRYSLER GROUP, LLC

47. Remove the transmission adapter (2) bolts (3).

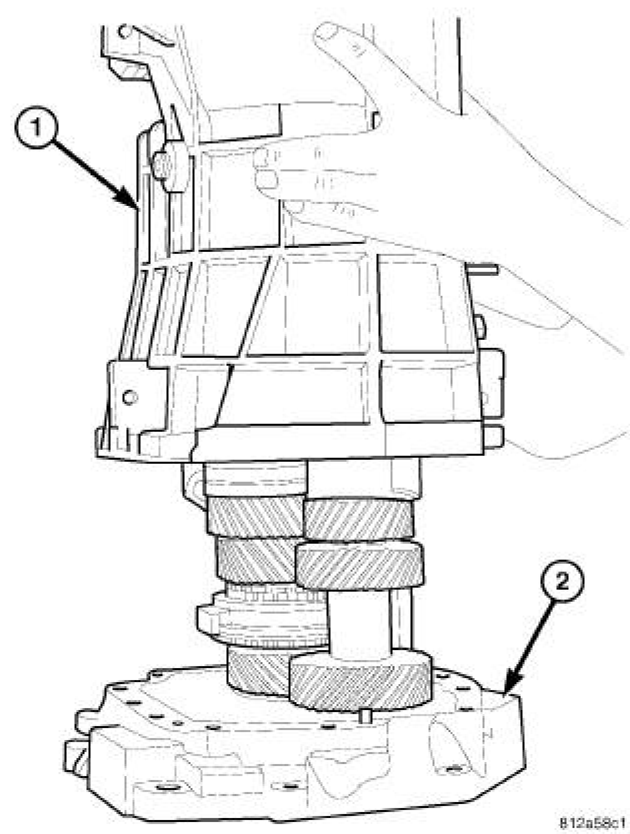

Fig. 73: Transmission Case
Courtesy of CHRYSLER GROUP, LLC

48. Remove the transmission case (1) upward off of the transmission adapter plate (2) and remove the skip shift lever from the shift rail.

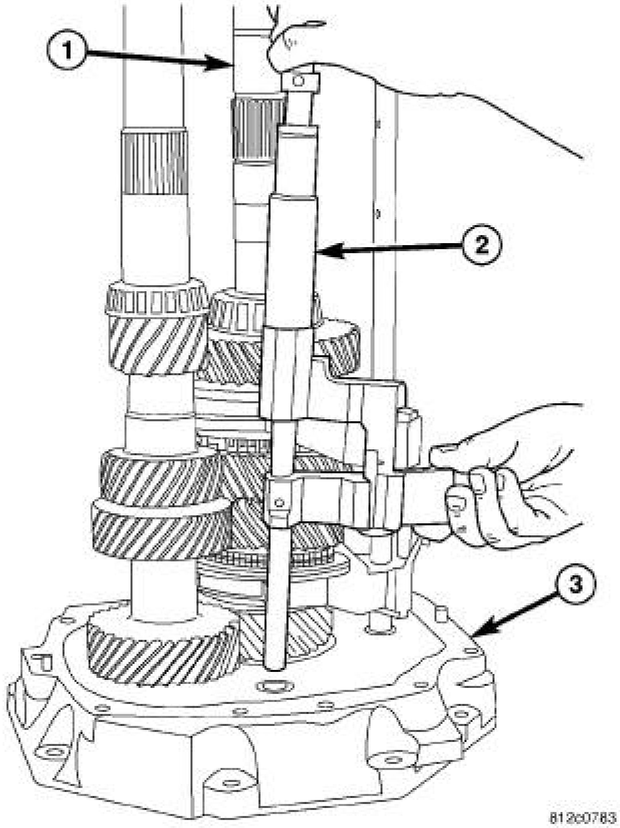

Fig. 74: Removing/Installing Reverse Shaft Rail Assembly
Courtesy of CHRYSLER GROUP, LLC

49. Remove the reverse shift rail assembly (2) from the transmission adapter (3).

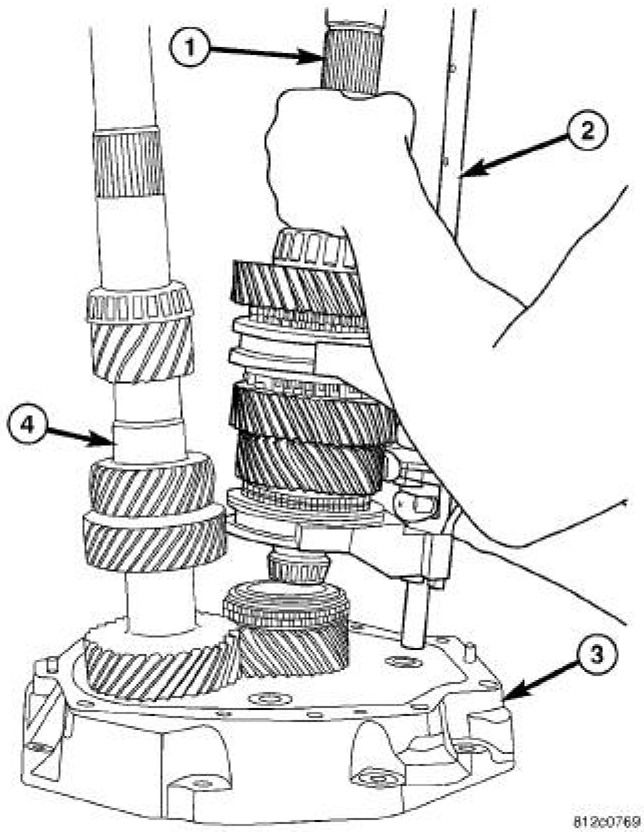

Fig. 75: Tilting Mainshaft & Shift Rail
Courtesy of CHRYSLER GROUP, LLC

50. Tilt the countershaft (4) sideways, then remove the mainshaft (1) and shift rail (2) from the adapter plate (3). Remove the countershaft assembly (4) from the adapter plate(3).

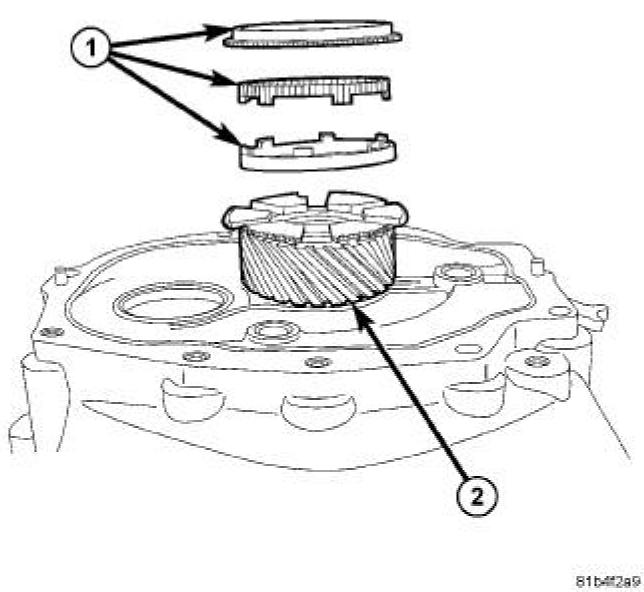

Fig. 76: Input Shaft Synchro Rings

Courtesy of CHRYSLER GROUP, LLC

51. Remove the input shaft synchronizer ring (1) and the input shaft (2) from the transmission adapter.

MAINSHAFT

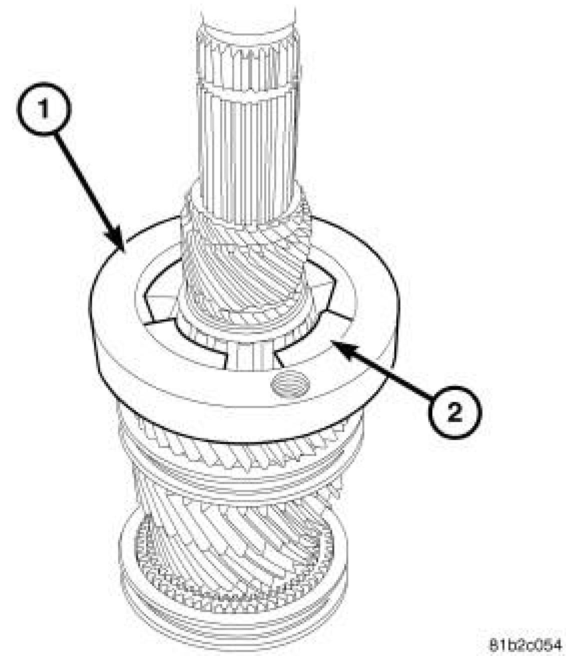

Fig. 77: Mainshaft Bearing Puller
Courtesy of CHRYSLER GROUP, LLC

1. Position Puller (special tool #C-293-PA, Puller, Press) (1) and Adapters (special tool #C-293-47, Block Set, Puller) (2) on the mainshaft bearing. Place Button (special tool #10027, Button, Press) in the end of the mainshaft.

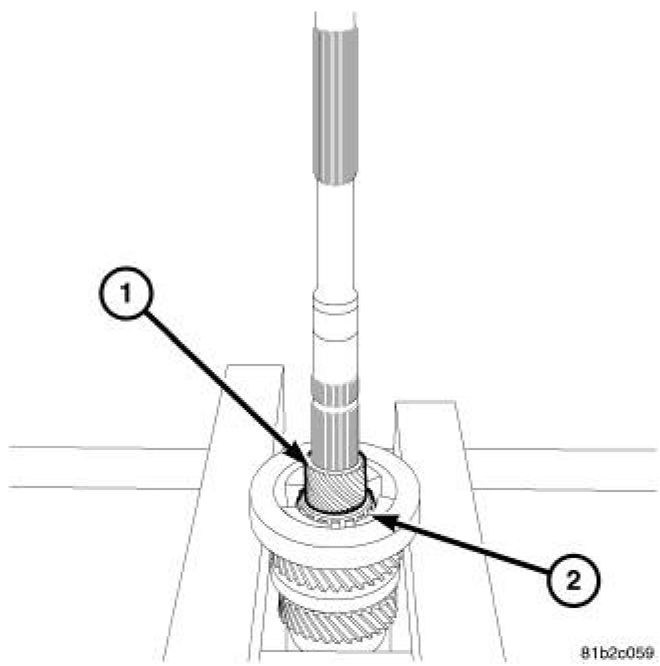

Fig. 78: Mainshaft Case Bearing

Courtesy of CHRYSLER GROUP, LLC

2. Remove the sixth gear (1) and mainshaft bearing (2) with Puller (special tool #C-293-PA, Puller, Press), Adapters (special tool #C-293-47, Block Set, Puller), Button (special tool #10027, Button, Press) and a press.

20. Remove third gear (1) from the mainshaft (2).

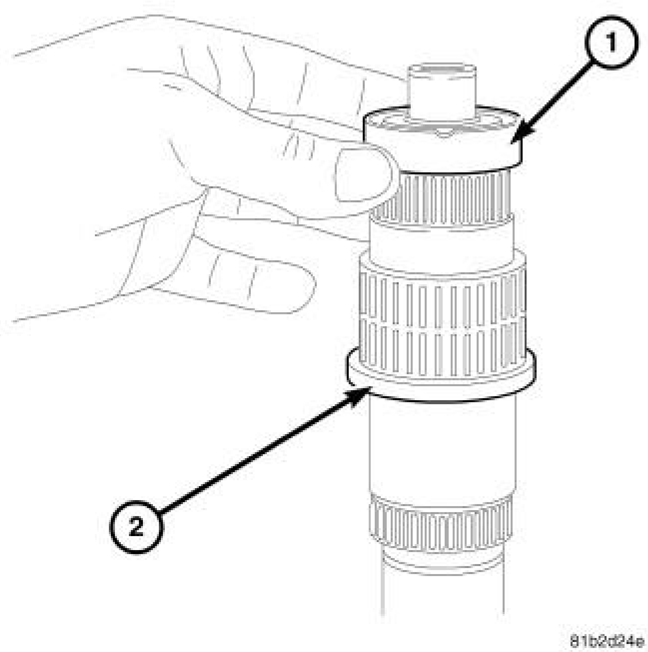

Fig. 97: 3rd Gear Bearing Spacer
Courtesy of CHRYSLER GROUP, LLC

21. Remove the third gear bearing spacer (1) from the mainshaft (2).

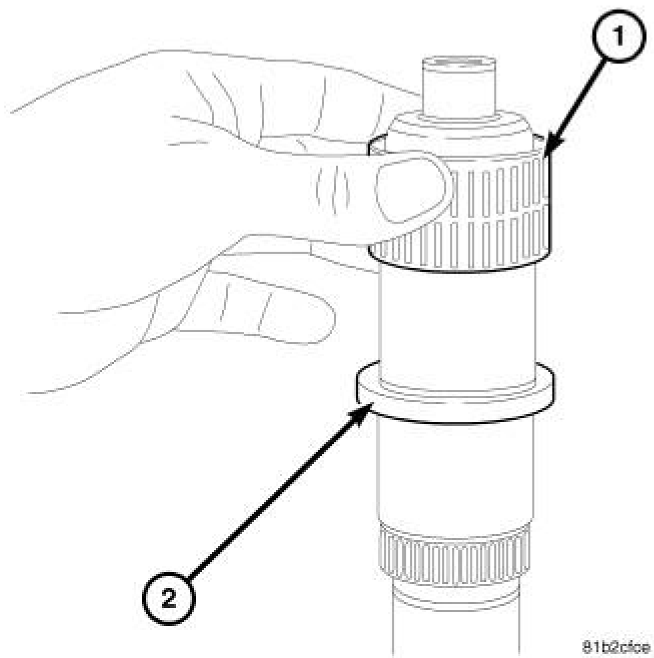

Fig. 98: 3rd Gear Bearing
Courtesy of CHRYSLER GROUP, LLC

22. Remove the third gear bearing (1) from the mainshaft (2).

COUNTERSHAFT

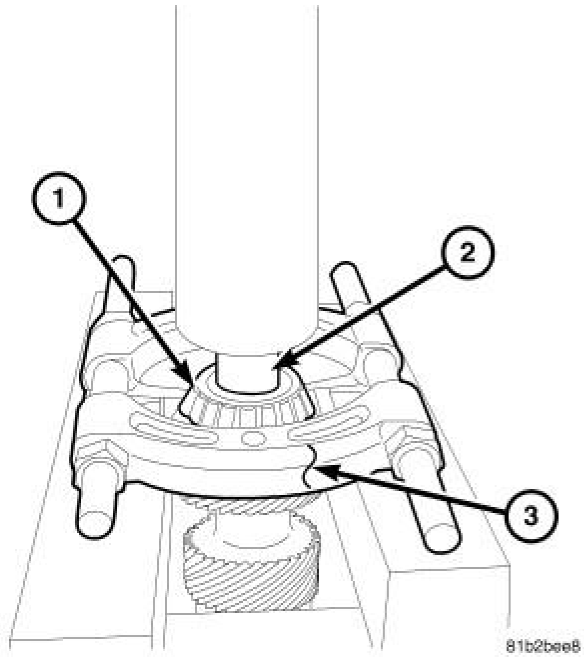

Fig. 99: Countershaft Adapter Bearing
Courtesy of CHRYSLER GROUP, LLC

1. Remove the countershaft adapter bearings (1) with Adapter (special tool #9377, Press Adapter) (2) Splitter (special tool #1130, Splitter, Bearing/Gear) (3) and a press.

INPUT SHAFT

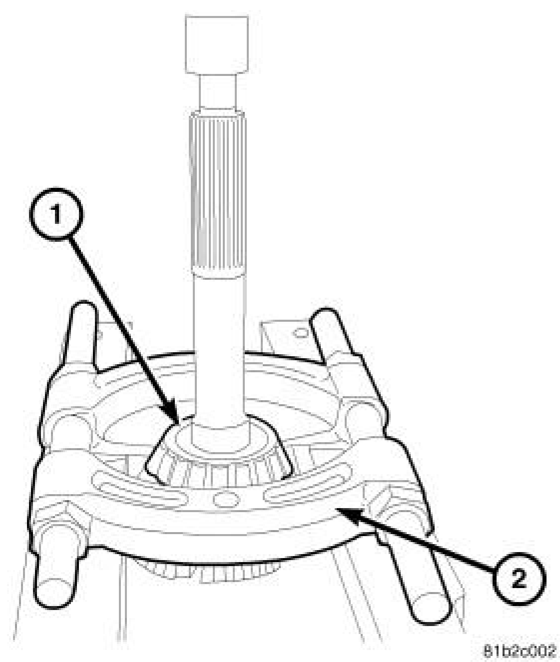

Fig. 100: Input Shaft Bearing
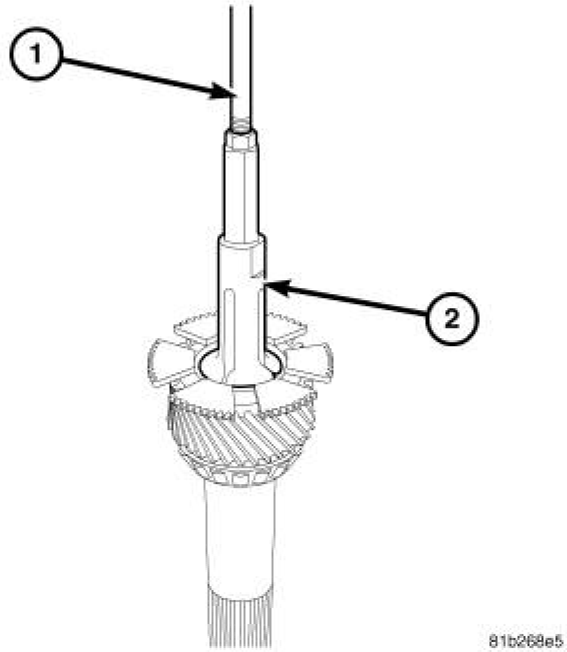
Courtesy of CHRYSLER GROUP, LLC

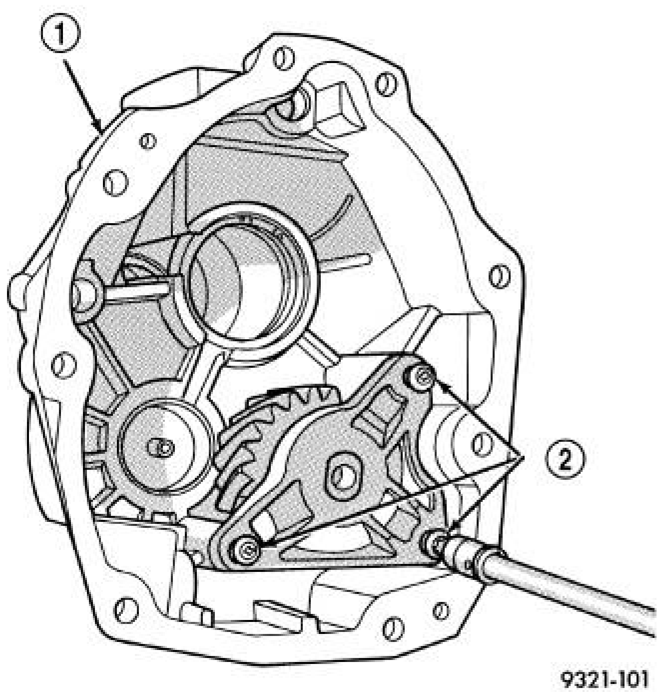
1. Remove the input shaft bearing (1) with Splitter (special tool #1130, Splitter, Bearing/Gear) (2) and a press.



[Fig. 101: Input Shaft Bearing Cup]()
Courtesy of CHRYSLER GROUP, LLC

2. Remove the input shaft bearing cup with Slide Hammer (special tool #C-3752, Slide Hammers) (1) and Remover (special tool #9381, Remover, Bearing Cup) (1).

EXTENSION HOUSING



[Fig. 102: Idler Gear Bracket Bolts]()
Courtesy of CHRYSLER GROUP, LLC

1. Remove the extension housing (1) idler gear bracket bolts (2) and the bracket.

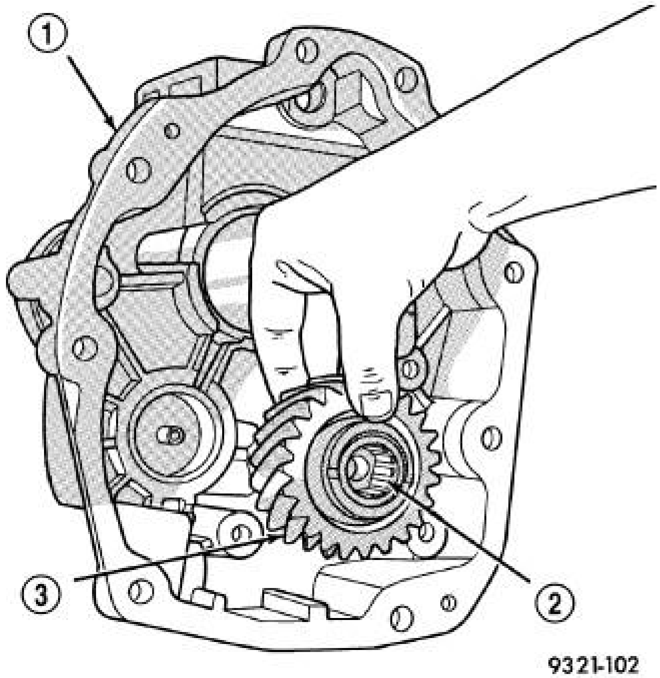


Fig. 103: Thrust Washer, Gear And Bearing
Courtesy of CHRYSLER GROUP, LLC

2. Remove the extension housing (1) idler gear bearing (2) and the idler gear (3).
3. Remove the idler gear shaft from the extension housing.

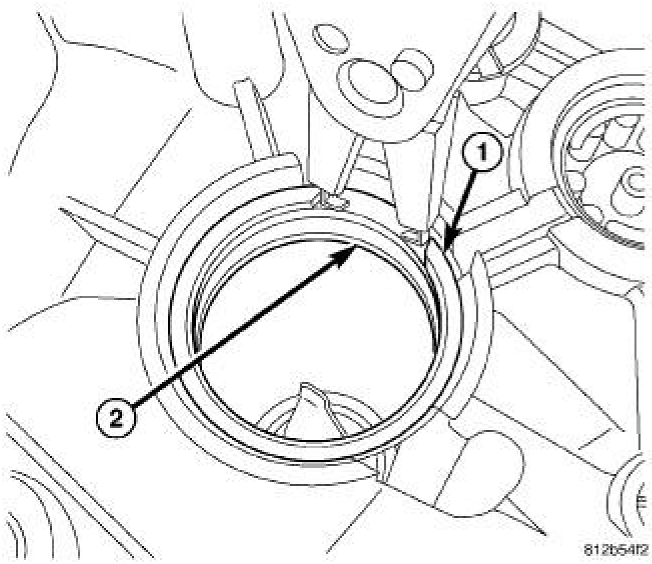

Fig. 104: Removing Mainshaft Race Snap Ring
Courtesy of CHRYSLER GROUP, LLC

4. Remove the mainshaft bearing cup (1) snap ring (2).

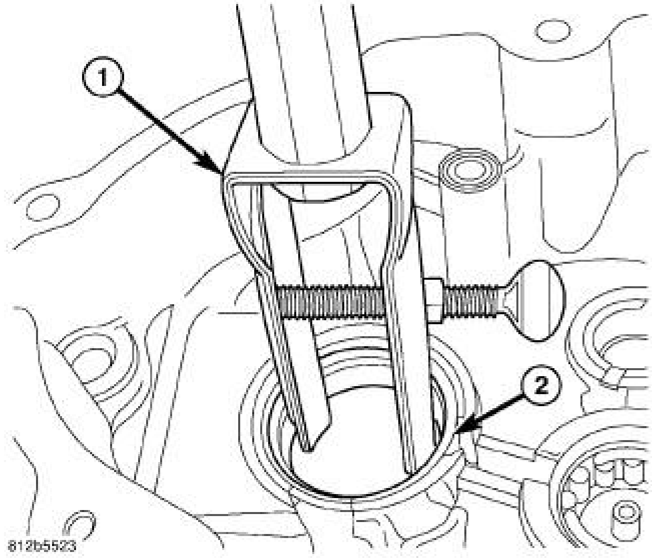

Fig. 105: Removing Mainshaft Race
Courtesy of CHRYSLER GROUP, LLC

5. Remove the mainshaft bearing cup (2) with Remover (special tool #7794-A, Remover, Seal) (1) and Slide Hammer (special tool #C-637, Slide Hammer, Universal).

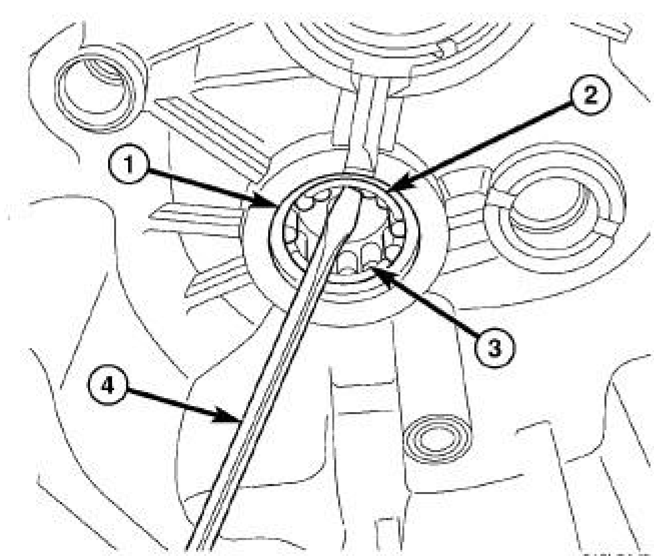

Fig. 106: Removing Countershaft Bearing Cage
Courtesy of CHRYSLER GROUP, LLC

6. Remove the countershaft bearing snap ring (1).
7. Remove the countershaft bearing plastic bearing cage (2) and remove roller bearings (3).

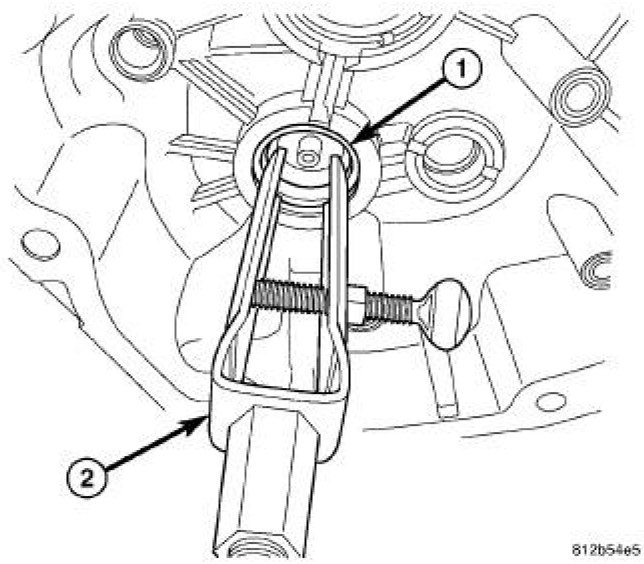

Fig. 107: Removing Countershaft Bearing Race
Courtesy of CHRYSLER GROUP, LLC

8. Remove the countershaft bearing cup (1) with Remover (special tool #7794-A, Remover, Seal) (2) and Slide Hammer (special tool #C-637, Slide Hammer, Universal).

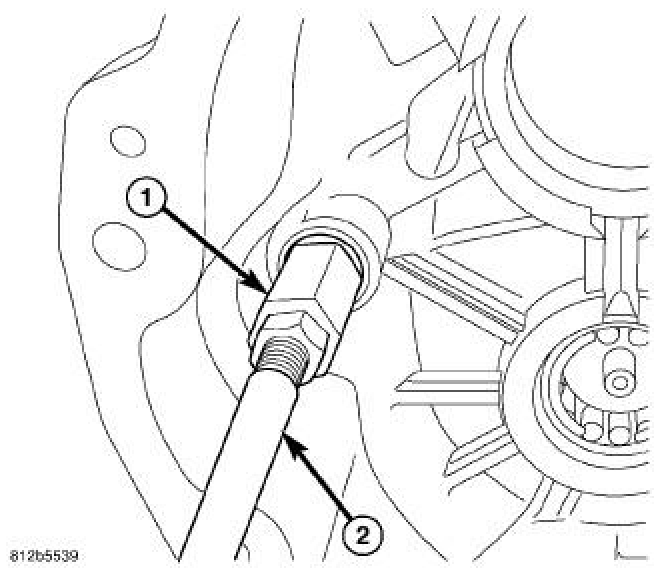

Fig. 108: Removing Shift Rail Bushing
Courtesy of CHRYSLER GROUP, LLC

9. Remove the shift rail bushings with Remover (special tool #6786, Remover, Bushing) (1) and Slide Hammer (special tool #C-3752, Slide Hammers) (2).

TRANSMISSION CASE

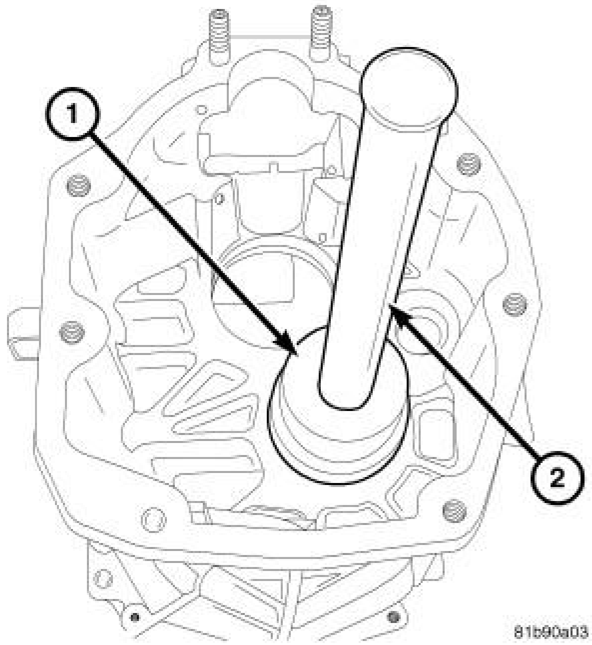

Fig. 109: Countershaft Bearing Cup
Courtesy of CHRYSLER GROUP, LLC

1. Remove the countershaft bearing cups with Remover (special tool #9369, Remover, Bearing Cup) (1) and Handle (special tool #C-4171, Driver Handle, Universal) (2).

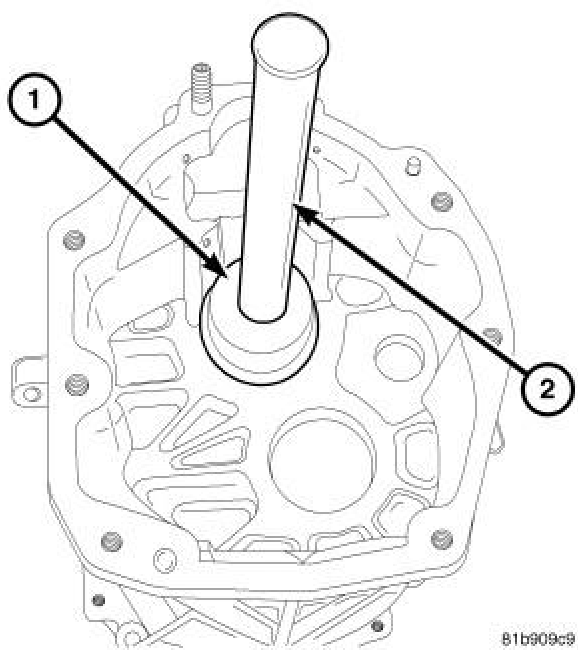

Fig. 110: Mainshaft Bearing Cup
Courtesy of CHRYSLER GROUP, LLC

2. Remove the mainshaft bearing cups with Remover (special tool #9369, Remover, Bearing Cup) (2) and Handle (special tool #C-4171, Driver Handle, Universal) (1).

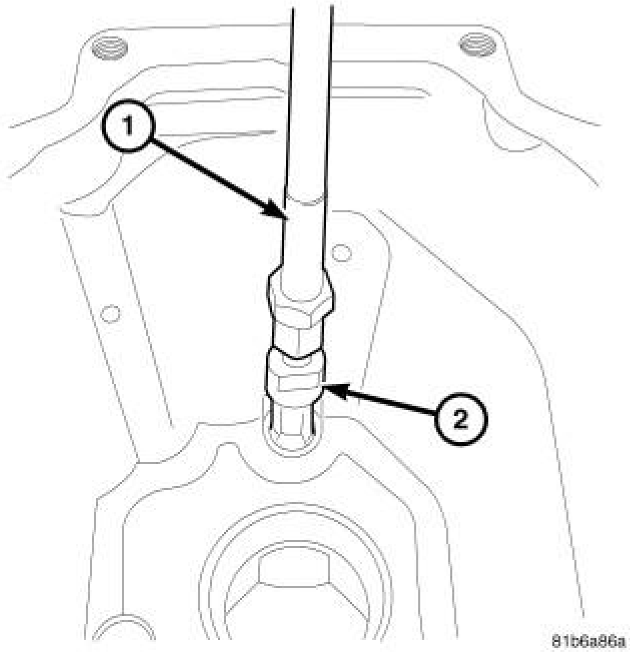

Fig. 111: Case Rail Bearing Remover
Courtesy of CHRYSLER GROUP, LLC

3. Remove the shift rail bearing with Slide Hammer (special tool #C-637, Slide Hammer, Universal) (1) and Remover (special tool #9609, Remover, Bearing) (2).

TRANSMISSION ADAPTER

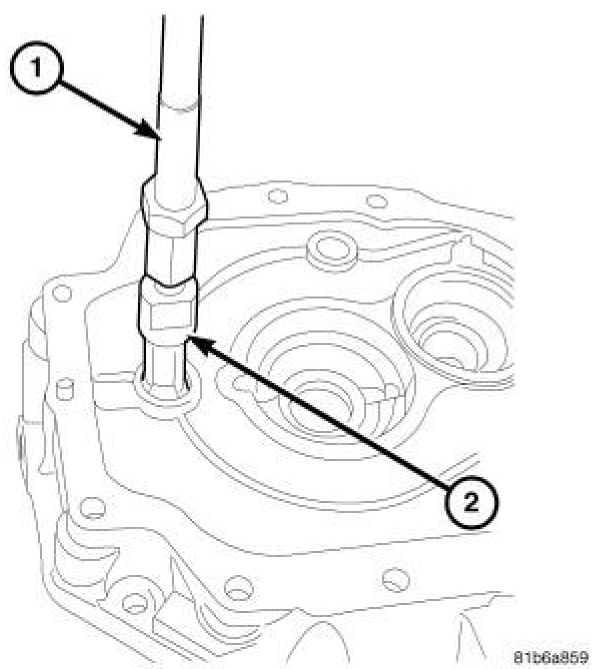

Fig. 112: Adapter Bearing Remover
Courtesy of CHRYSLER GROUP, LLC

1. Remove the shift rail bearing with Slide Hammer (special tool #C-637, Slide Hammer, Universal) (1) and Remover (special tool #9609, Remover, Bearing) (2).

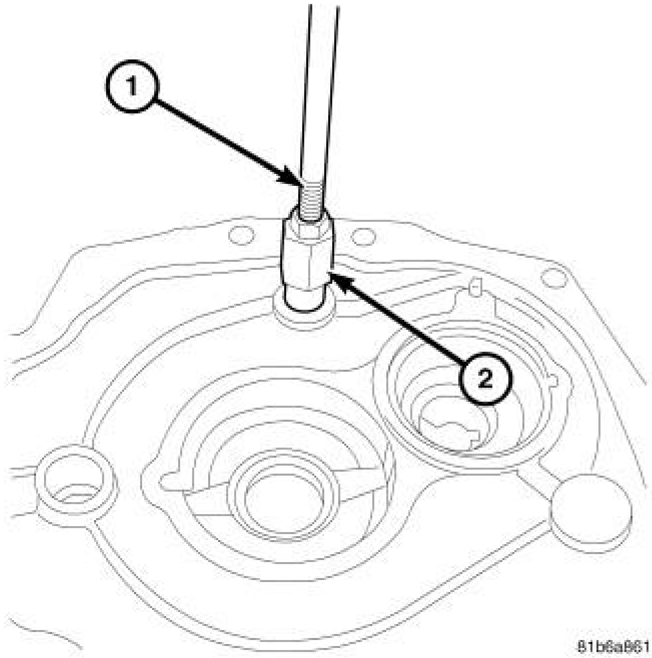

Fig. 113: Adapter Bushing Remover
Courtesy of CHRYSLER GROUP, LLC

2. Remove the shift rail bushing with Slide Hammer (special tool #C-3752, Slide Hammers) (1) and Remover (special tool #6786, Remover, Bushing) (2).

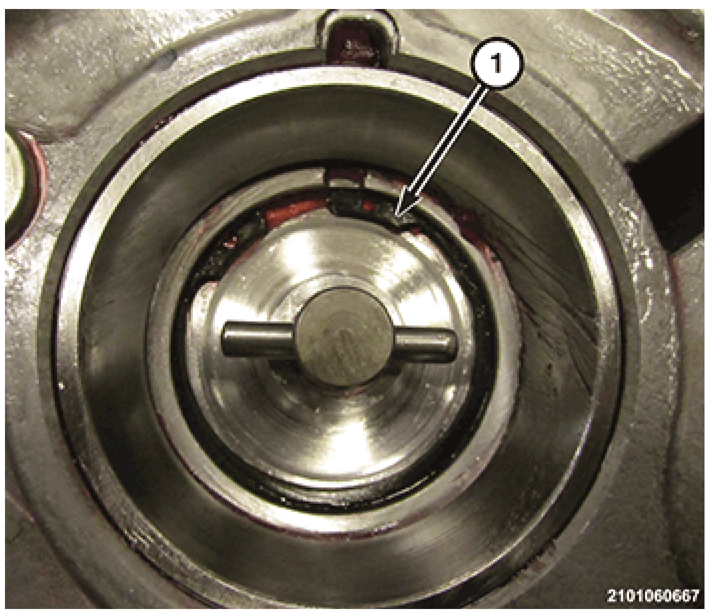

Fig. 114: Transmission Oil Pump Snap Ring
Courtesy of CHRYSLER GROUP, LLC

3. If equipped, remove the transmission oil pump snap ring (1).

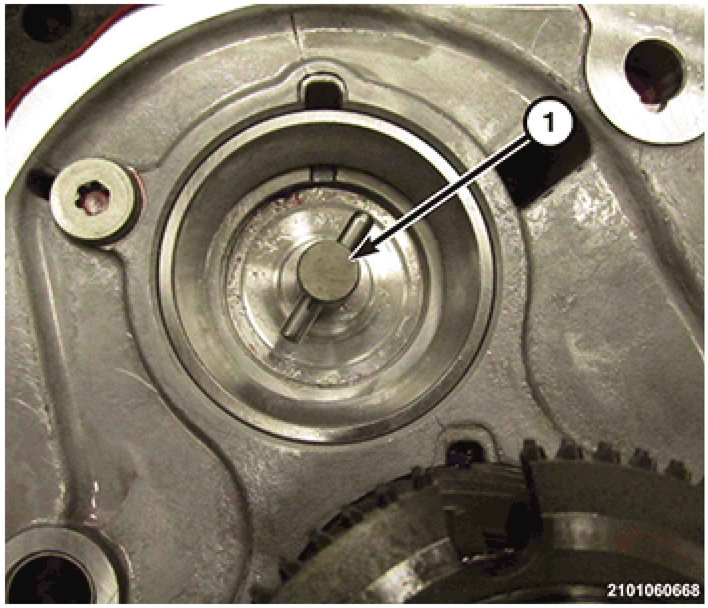

Fig. 115: Transmission Oil Pump
Courtesy of CHRYSLER GROUP, LLC

4. If equipped, remove the transmission oil pump.

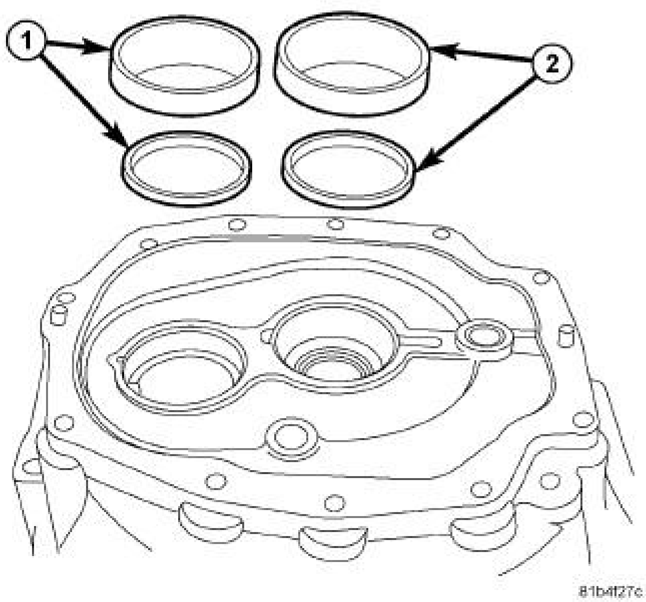

Fig. 116: Selecting Shims
Courtesy of CHRYSLER GROUP, LLC

5. Remove the countershaft bearing cup and select shim (1). Remove the mainshaft bearing cup and select shim (2).

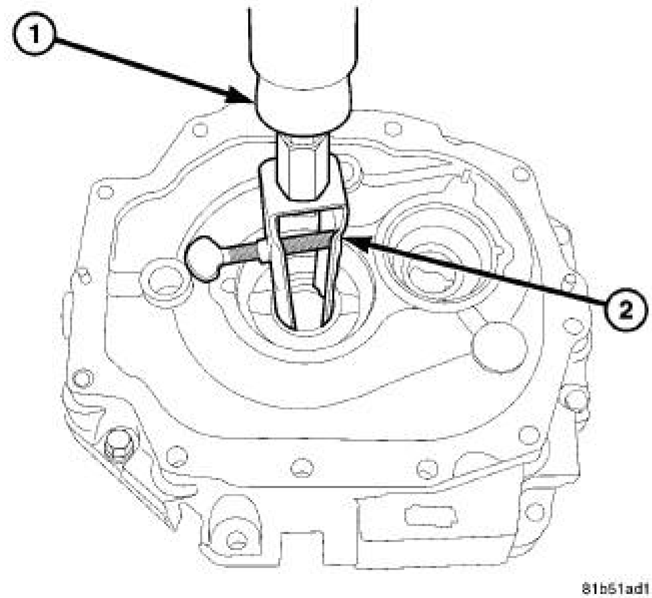

Fig. 117: Input Seal Puller
Courtesy of CHRYSLER GROUP, LLC

6. Remove the input shaft seal with Slide Hammer (special tool #C-637, Slide Hammer, Universal) (1) and Puller (special tool #7794-A, Remover, Seal) (2).

CLEANING

CLEANING

Clean the gears, bearings shafts, extension/adapter housing and gear case with solvent. Dry all parts except the bearings with compressed air. Allow the bearings to either air dry or wipe them dry with clean shop towels.

INSPECTION

INSPECTION

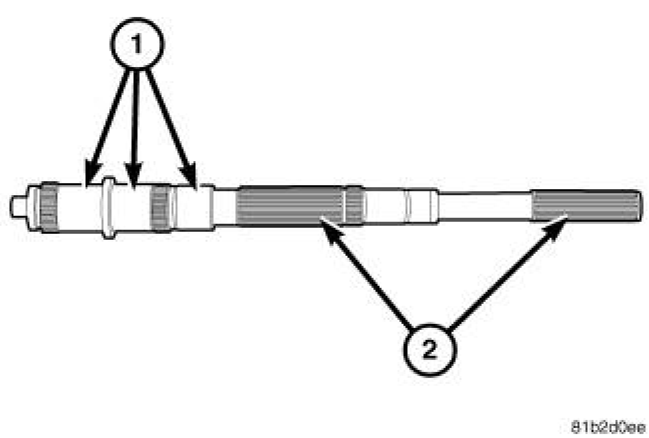

Fig. 118: Bearing Surfaces & Splines

Courtesy of CHRYSLER GROUP, LLC

NOTE: **Minor corrosion, nicks, or pitting can be smoothed with 400 grit emery and polished out with crocus cloth.**

Mainshaft: Inspect the bearing surfaces (1) for wear or flat-spots. Inspect the splines (2) and snap ring grooves for wear. Inspect the output seal surface for wear.

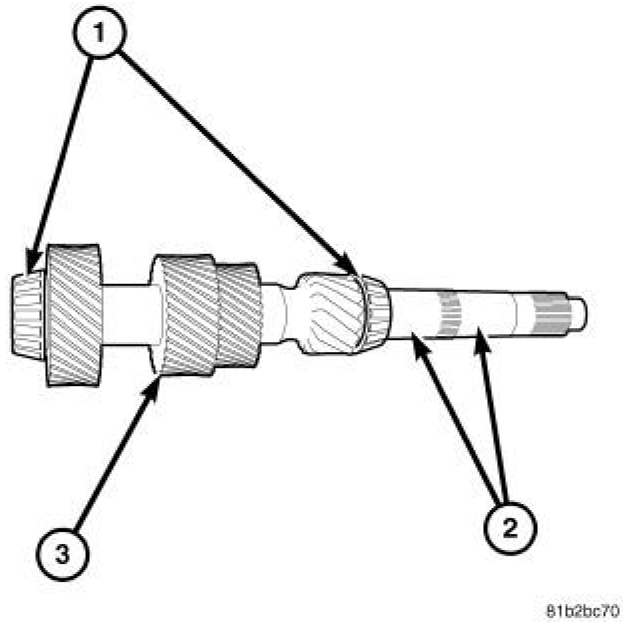

Fig. 119: Roller Bearings, Surfaces & Gear Teeth
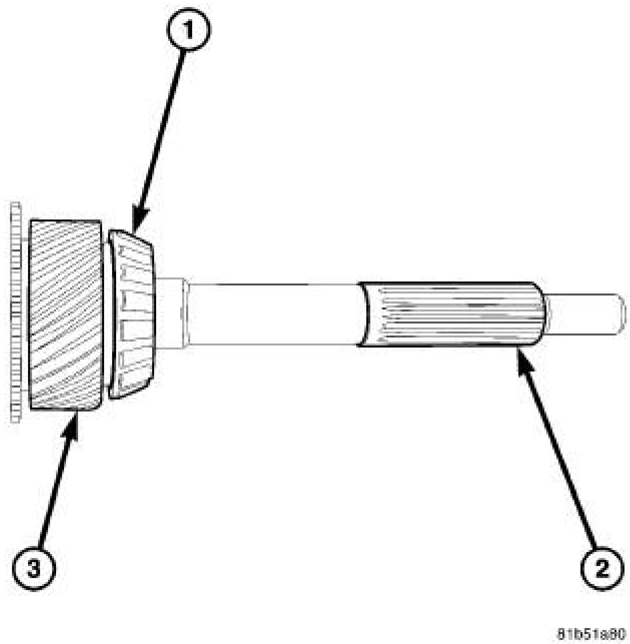
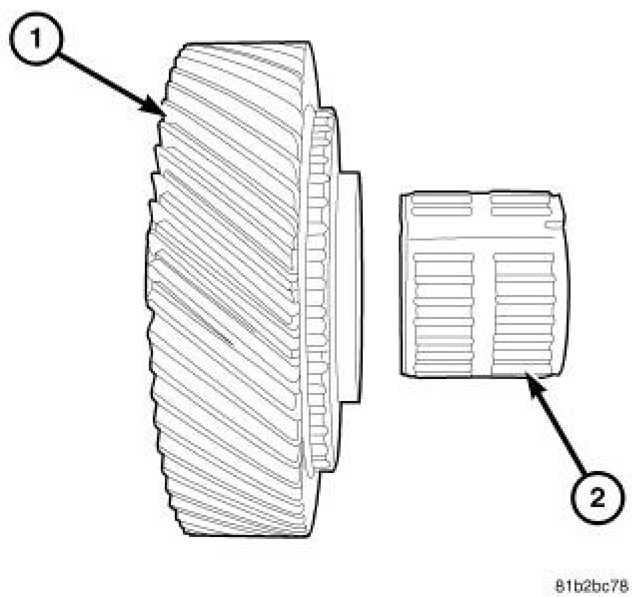
Courtesy of CHRYSLER GROUP, LLC

Countershaft: Inspect the roller bearings (1) for wear, peeling, pitting or flat-spots. Inspect the bearing surfaces (2) for wear or flat-spots. Inspect the gear teeth (3) for wear, chips or cracks. Inspect the splines and snap ring grooves for wear.



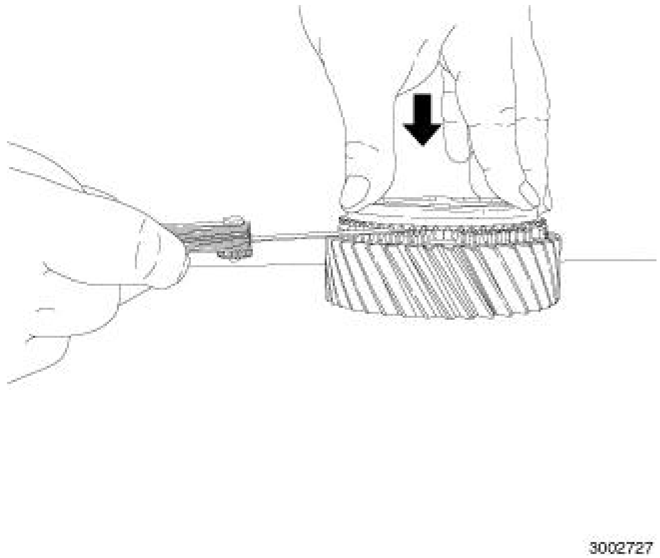
[Fig. 120: Input Shaft Bearing, Splines & Forth Gear]
Courtesy of CHRYSLER GROUP, LLC

Input Shaft: Inspect the input shaft bearing (1) for wear, peeling, pitting or flat-spots. Inspect the input shaft splines (2) for wear. Inspect the fourth gear (3) for worn, chipped, or cracked teeth. Inspect the input seal surface for wear.



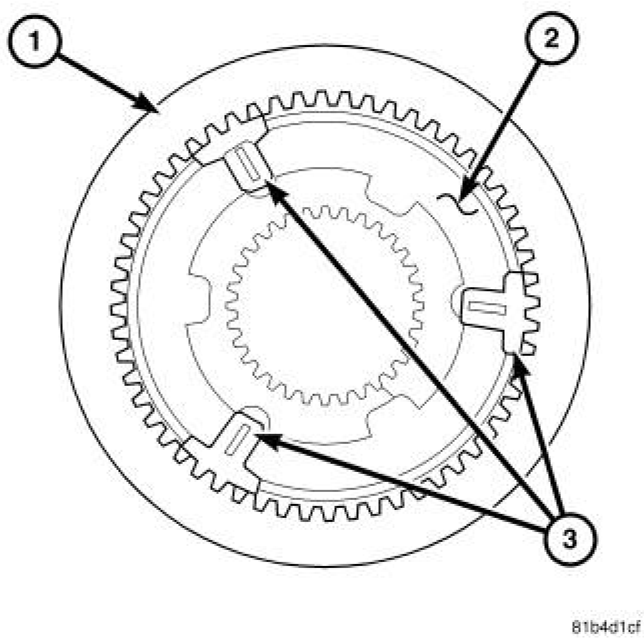
[Fig. 121: Gear & Bearing]
Courtesy of CHRYSLER GROUP, LLC

Gears: Inspect the gears (1) for worn, chipped or cracked teeth and the bearing surfaces for wear, peeling, pitting or flat-spots. Inspect the gear bearings (2) for wear, peeling, pitting, flat-spots or damaged bearing cage.



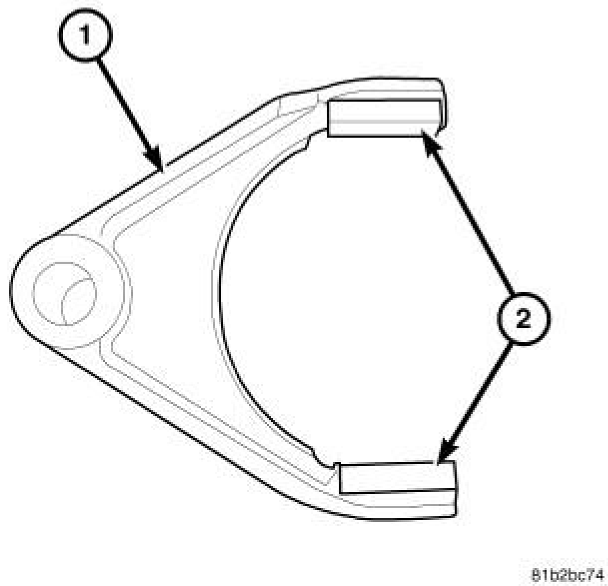
[Fig. 122: Measuring Clearance Between Blocker Ring & Gear]
Courtesy of CHRYSLER GROUP, LLC

Synchronizer components: Inspect the synchronizer rings (1) for worn, chipped, or cracked teeth and burned or flaking friction material. Place the blocker rings on the gears. While applying pressure and rotating the blocker ring measure the clearance between the blocker ring and gear. If the clearance is less than 0.75 mm (0.030 in.) replace the blocker ring.**Synchronizer rings are serviced as an assembly.**



[Fig. 123: Synchronizer Sleeve, Hub & Detents]
Courtesy of CHRYSLER GROUP, LLC

Inspect the synchronizer sleeve (1) and hub (2) for worn teeth. Inspect the synchronizer detents (3) for broken springs, missing balls or cracked/damaged housings.



[Fig. 124: Shift Forks & Shoes](#)
Courtesy of CHRYSLER GROUP, LLC

Shift Forks/Shift Rails: Inspect the shift forks (1) for distortion. Inspect the shift fork shoes (2) for wear or cracks. Fit the shoes in the synchronizer sleeve to ensure the parts fit and work smoothly. Inspect the shift rails for wear. Inspect the shift rail bushings and bearings for wear.

ASSEMBLY

ASSEMBLY

TRANSMISSION ADAPTER

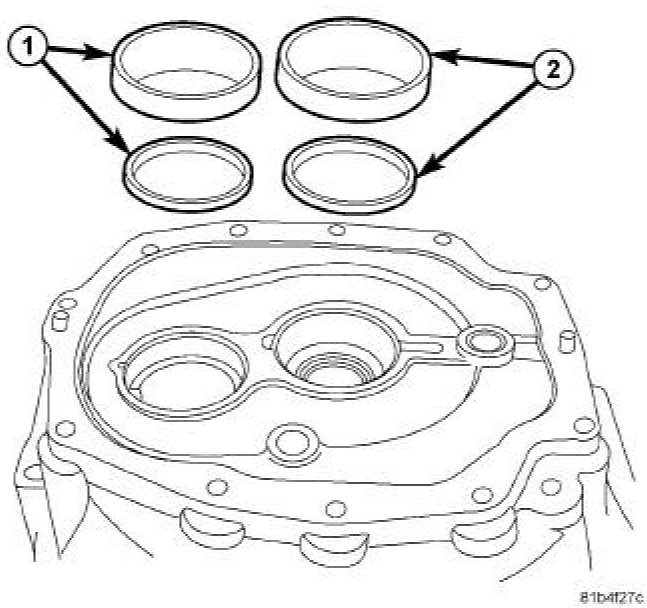


Fig. 125: Selecting Shims
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Refer to ADJUSTMENTS for Mainshaft and Countershaft end play shim selection .**

1. Install the countershaft select shim and bearing cup (1) into the adapter plate. Install the mainshaft select shim and bearing cup (2) into the adapter plate.

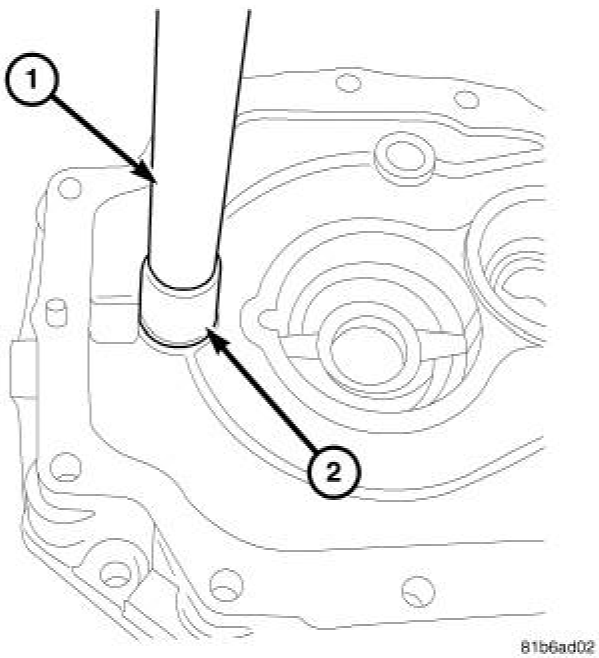

Fig. 126: Adapter Bearing Installer
Courtesy of CHRYSLER GROUP, LLC

2. Install the shift rail bearing with Handle (special tool #C-4171, Driver Handle, Universal) (1) and Installer (special tool #10028, Installer, Bearing) (2).

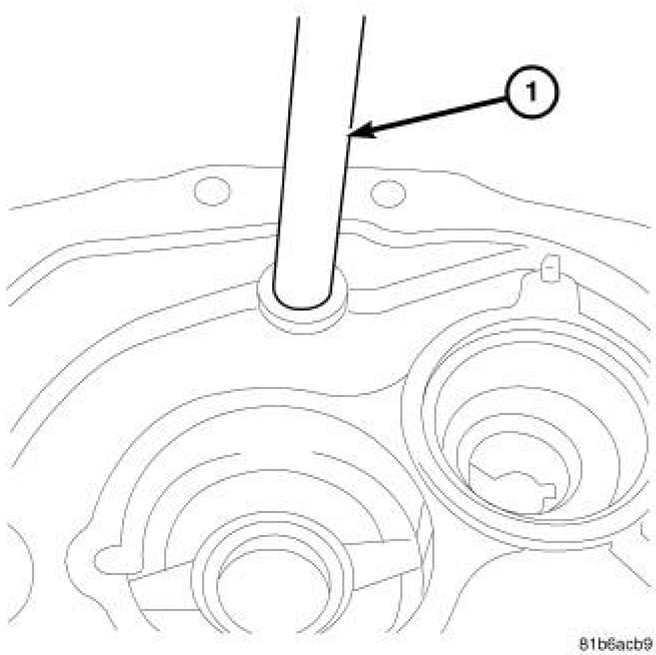

Fig. 127: Adapter Bushing Installer
Courtesy of CHRYSLER GROUP, LLC

3. Install the shift rail bushing with Installer (special tool #8475, Installer, Bushing) (1).

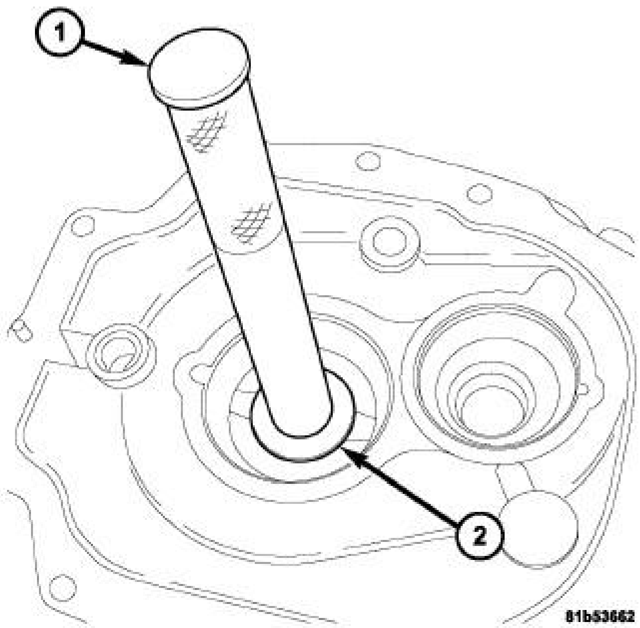

Fig. 128: Input Shaft Seal
Courtesy of CHRYSLER GROUP, LLC

4. Install the input shaft seal with Handle (special tool #C-4171, Driver Handle, Universal) (1) and Installer (special tool #9366, Installer, Seal) (2).

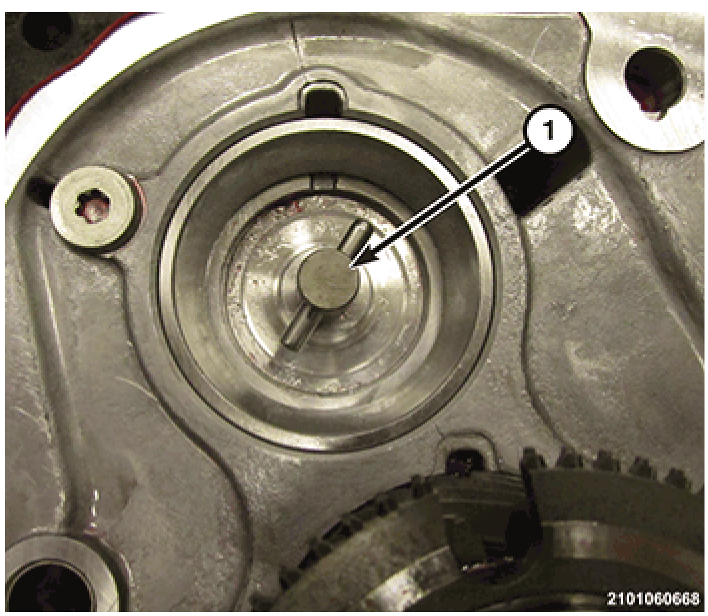

Fig. 129: Transmission Oil Pump
Courtesy of CHRYSLER GROUP, LLC

5. If equipped, install the transmission oil cooler pump.

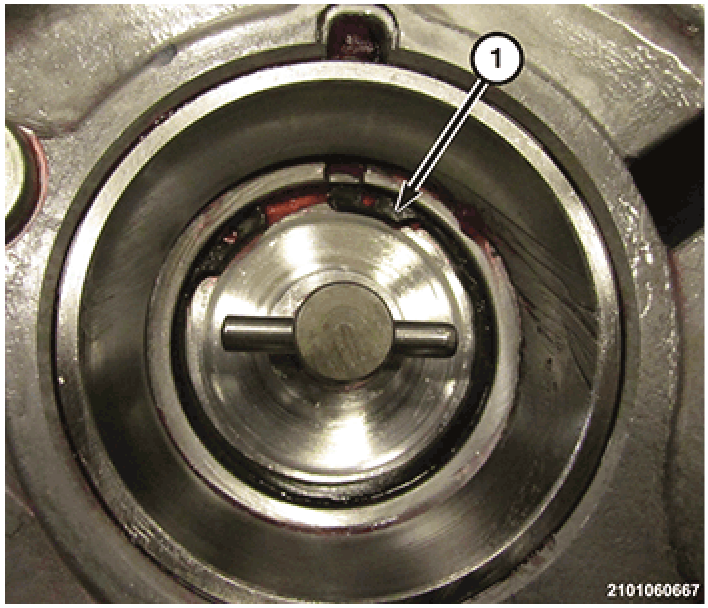

Fig. 130: Transmission Oil Pump Snap Ring
Courtesy of CHRYSLER GROUP, LLC

6. If equipped, install the transmission oil cooler pump snap ring.
7. If equipped, install the transmission oil filter.

TRANSMISSION CASE

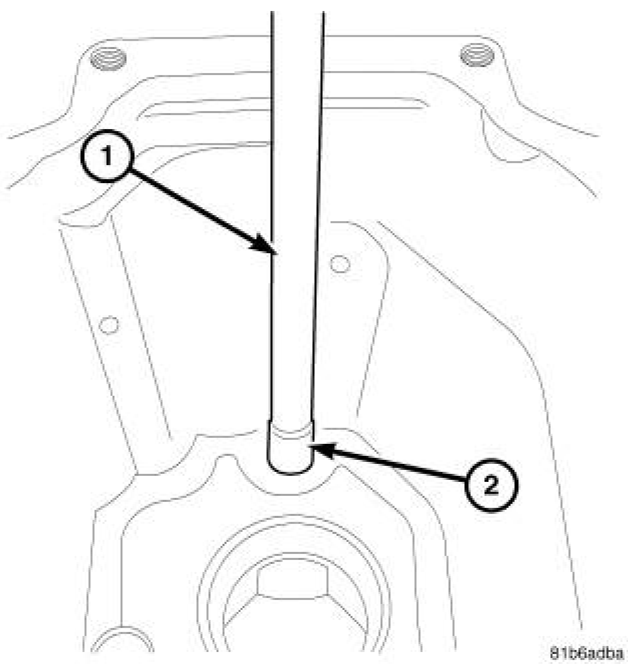

Fig. 131: Case Rail Bearing Installer
Courtesy of CHRYSLER GROUP, LLC

1. Install the shift rail bearing with Handle (special tool #C-4171, Driver Handle, Universal) (1) and Installer (special tool #10028, Installer, Bearing) (2).

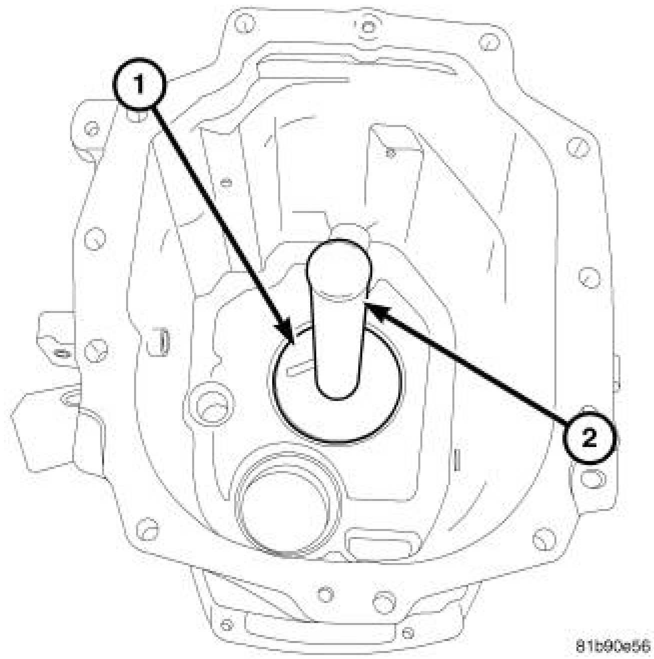

Fig. 132: Mainshaft Bearing Cup
Courtesy of CHRYSLER GROUP, LLC

2. Install the mainshaft bearing cup with Handle (special tool #C-4171, Driver Handle, Universal) (1) and Installer (special tool #9373, Installer, Bearing Cup) (2).

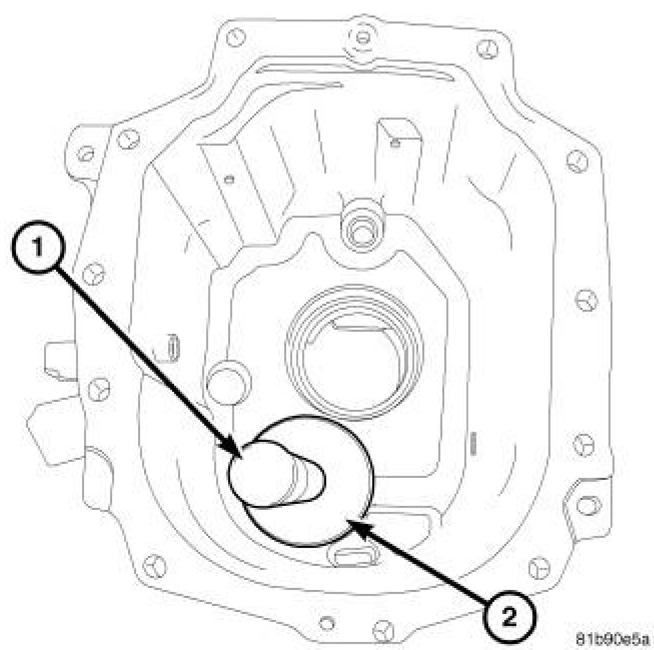

Fig. 133: Countershaft Bearing Cup
Courtesy of CHRYSLER GROUP, LLC

3. Install the countershaft bearing cup with Handle (special tool #C-4171, Driver Handle, Universal) (1) and Installer (special tool #9373, Installer, Bearing Cup) (2).

EXTENSION HOUSING

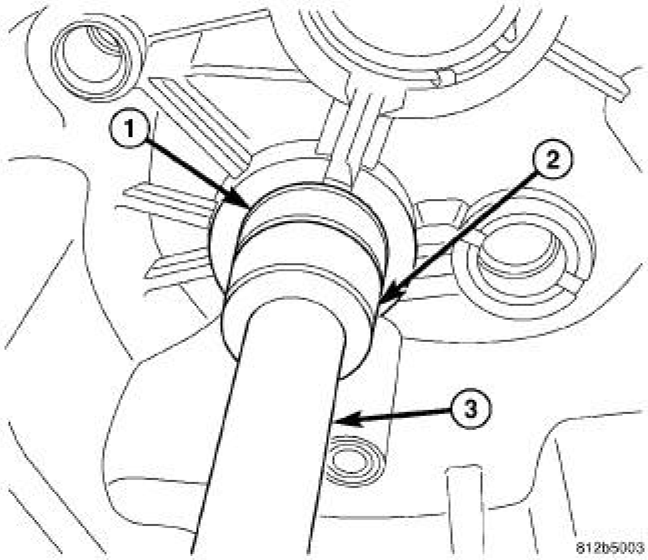

Fig. 134: Installing Countershaft Bearing
Courtesy of CHRYSLER GROUP, LLC

1. Install the countershaft bearing (1) with Installer (special tool #9394, Installer, Bearing) (2) and Handle (special tool #C-4171, Driver Handle, Universal) (3).
2. Install the countershaft bearing snap ring.

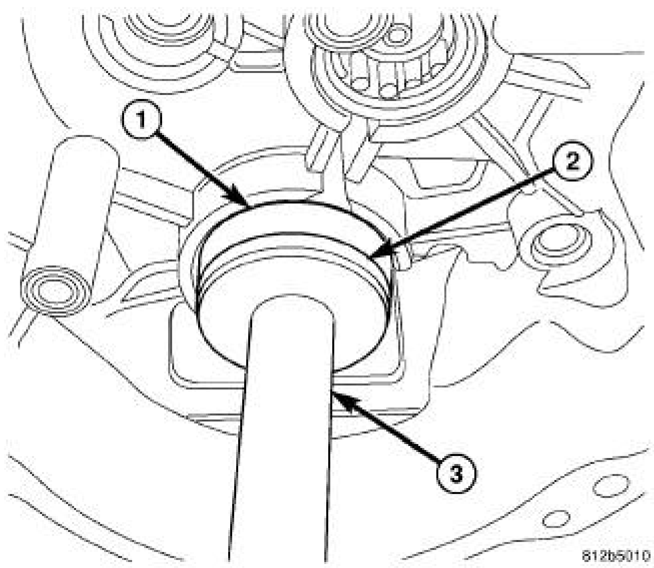

Fig. 135: Installing Mainshaft Bearing Race
Courtesy of CHRYSLER GROUP, LLC

3. Install the mainshaft bearing cup (1) with Installer (special tool #9392, Installer, Bearing Cup) (2) and Handle (special tool #C-4171, Driver Handle, Universal) (3).

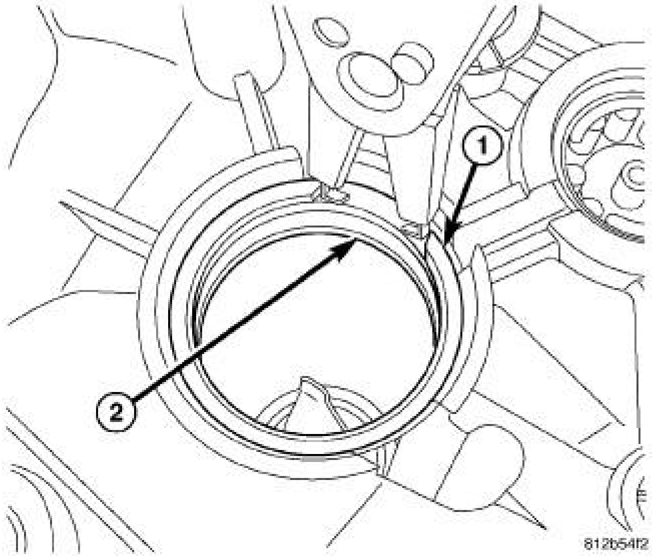

Fig. 136: Removing Mainshaft Race Snap Ring
Courtesy of CHRYSLER GROUP, LLC

4. Install the mainshaft bearing cup (2) snap ring (1).

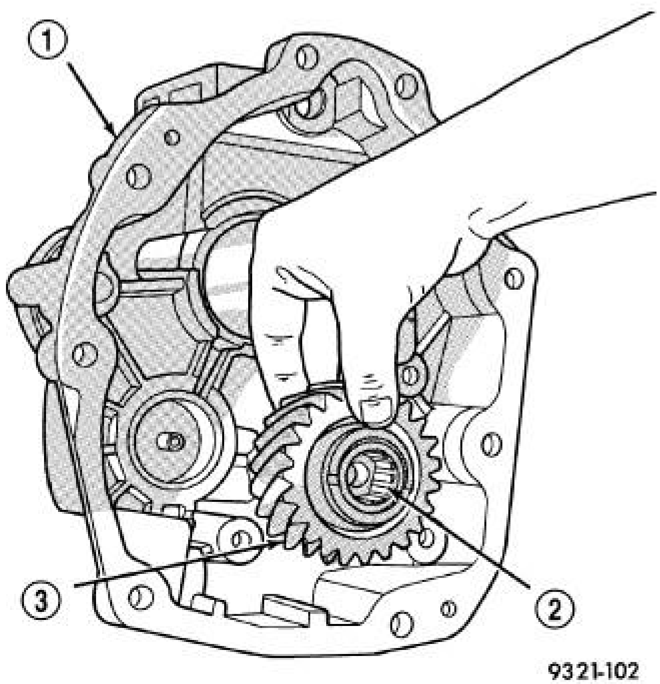

Fig. 137: Thrust Washer, Gear And Bearing
Courtesy of CHRYSLER GROUP, LLC

5. Install the reverse idler gear shaft in the extension housing (1).
6. Install the reverse idler gear bearing (2) and the idler gear (3).

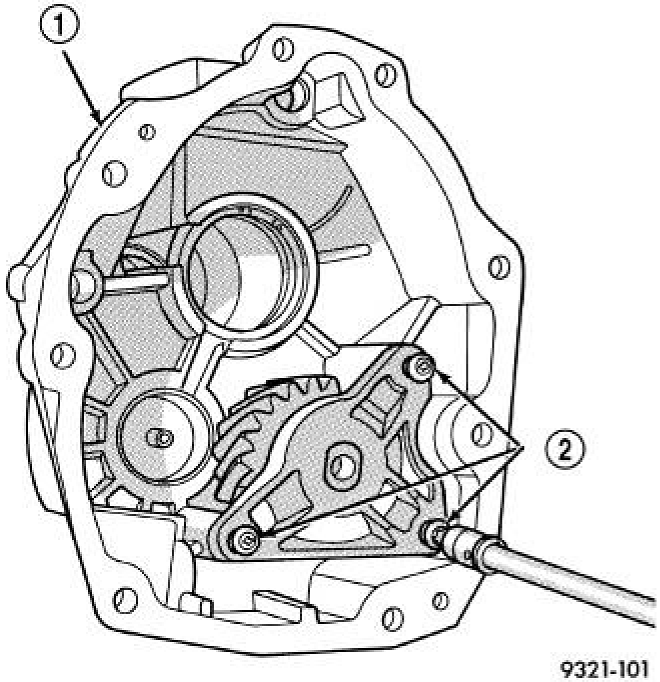

Fig. 138: Idler Gear Bracket Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Install the reverse idler gear bracket into the tail housing (1).
8. Apply Mopar Ā® Lock AND Seal Adhesive or equivalent on the idler gear bracket bolts (2). Install bolts (2) and tighten to the proper **SPECIFICATIONS** .

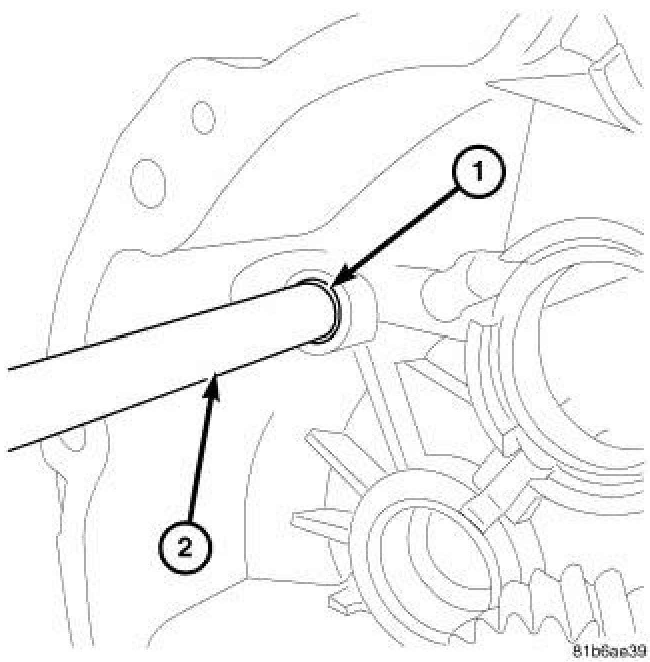

Fig. 139: Shift Rail Bushing Installer
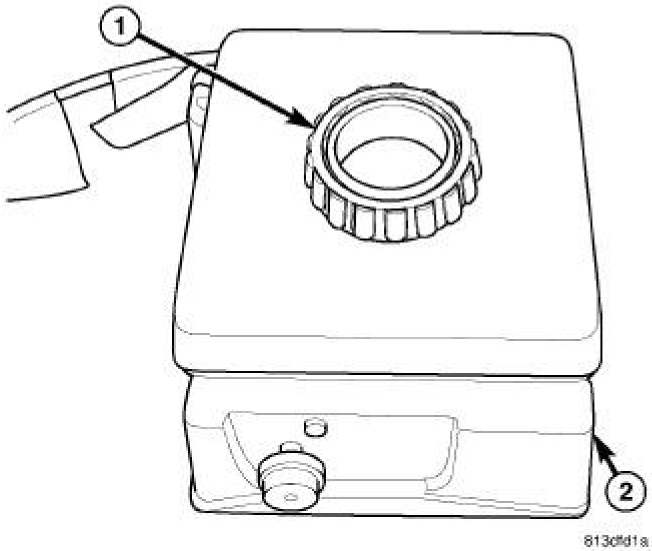
Courtesy of CHRYSLER GROUP, LLC

9. Install the shift rail bushings (1) with Installer (special tool #8475, Installer, Bushing) (2).

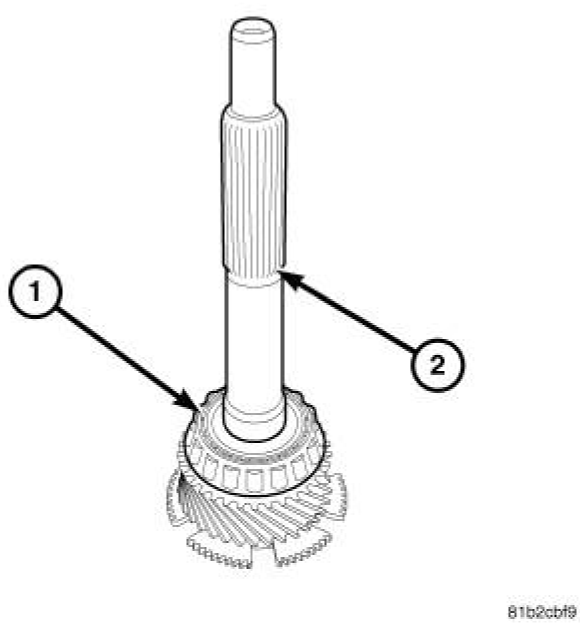
INPUT SHAFT



[Fig. 140: Identifying Bearing Heater And Bearing]
Courtesy of CHRYSLER GROUP, LLC

WARNING: Use tongs or welding gloves when handling heated components. Failure to follow these instructions will result in personal injury.

CAUTION: Bearings (1) are installed using a Bearing Heater (2). Use only a bearing heater/hot plate and follow manufacture's instructions. Heat components to 100 - 149 Celsius (212Â° Min. - 300Â° Max Fahrenheit). Never use an open flame to heat components. Never leave components on heater for an extended amount of time. If component is discolored after heating, the component has been overheated and must not be used. Failure to follow these instructions will result in component damage.



[Fig. 141: Input Shaft Bearing]

Courtesy of CHRYSLER GROUP, LLC

1. Heat the input shaft bearing to 100Ā° - 149Ā°C (212Ā° - 300Ā° F) and install the bearing (1) onto the input shaft (2) with tongs or welding gloves.

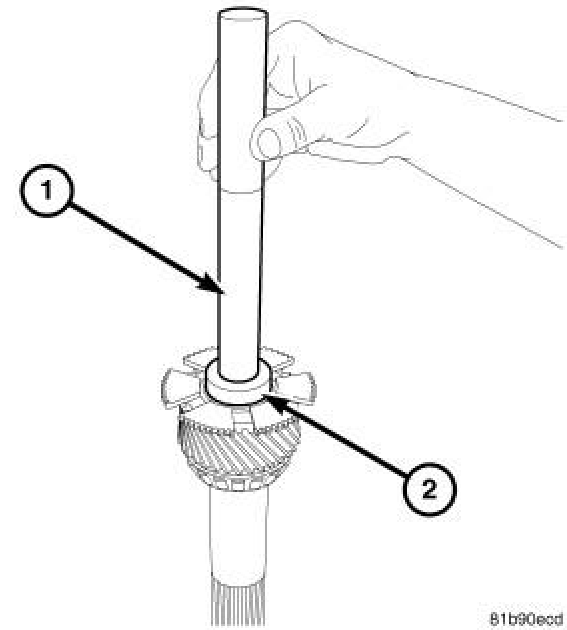


Fig. 142: Input Shaft Bearing Cup
Courtesy of CHRYSLER GROUP, LLC

2. Install the input shaft bearing cup with Handle (special tool #C-4171, Driver Handle, Universal) (1) and Installer (special tool #9380, Installer, Bearing Cup) (2).

COUNTERSHAFT

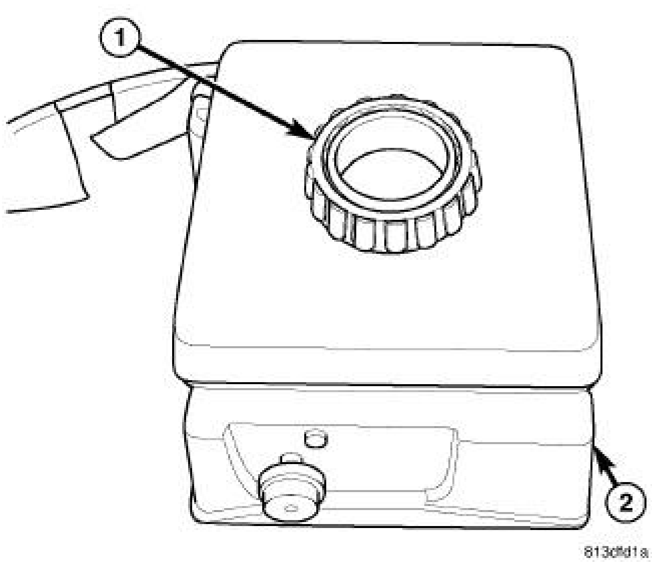

Fig. 143: Identifying Bearing Heater And Bearing
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Use tongs or welding gloves when handling heated components. Failure to follow these instructions will result in personal injury.**

CAUTION: **Bearings (1) are installed using a Bearing Heater (2). Use only a bearing heater/hot plate and follow manufacture's instructions. Heat components to 100 - 149 Celsius (212Ā° Min. - 300Ā° Max Fahrenheit). Never use an open flame to heat components. Never leave components on heater for an extended amount of time. If component is discolored after heating, the component has been overheated and must not be used. Failure to follow these instructions will result in component damage.**

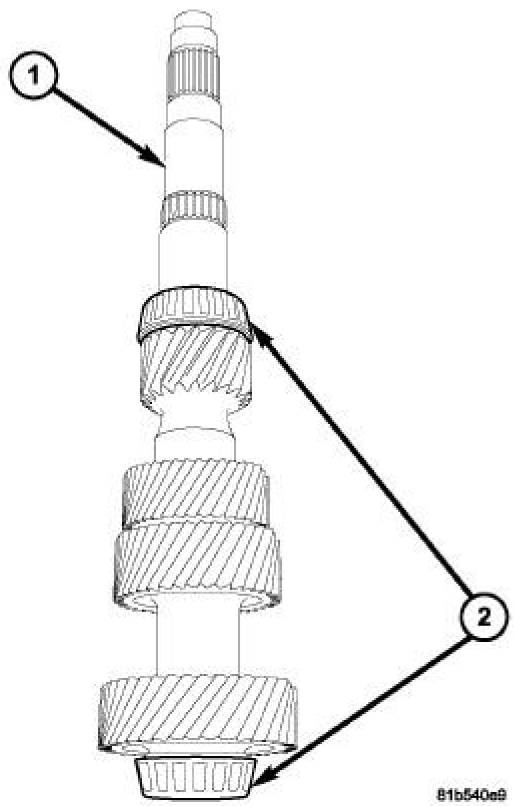

Fig. 144: Countershaft Bearings
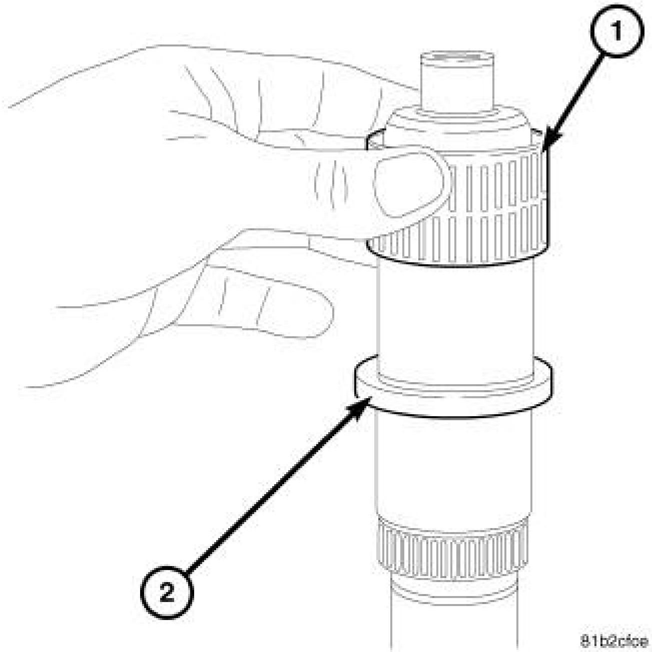
Courtesy of CHRYSLER GROUP, LLC

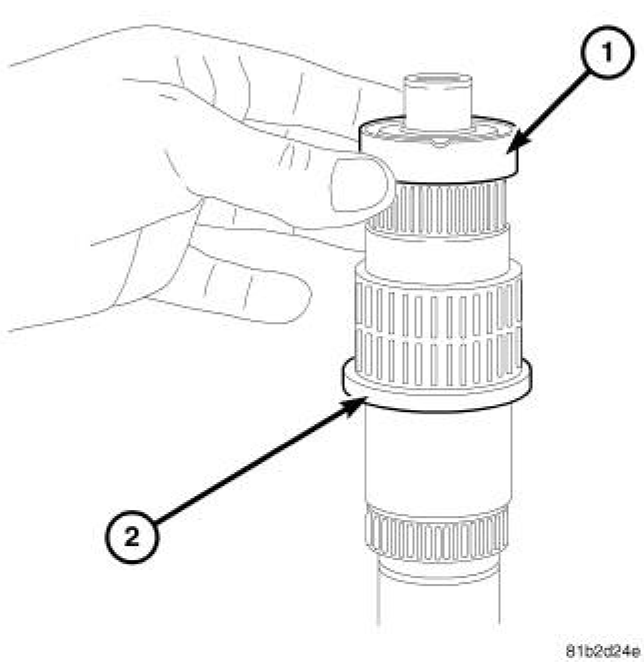
1. Heat the countershaft (1) bearings (2) to 100Ā° - 149Ā° C(212Ā° - 300Ā°F). Install the countershaft (1) bearings (2) onto the countershaft with tongs or welding gloves.

MAINSHAFT



[Fig. 145: 3rd Gear Bearing]
Courtesy of CHRYSLER GROUP, LLC

1. Install the third gear bearing (1) on the mainshaft (2).



[Fig. 146: 3rd Gear Bearing Spacer]
Courtesy of CHRYSLER GROUP, LLC

2. Install the third gear bearing spacer (1) on the mainshaft (2).

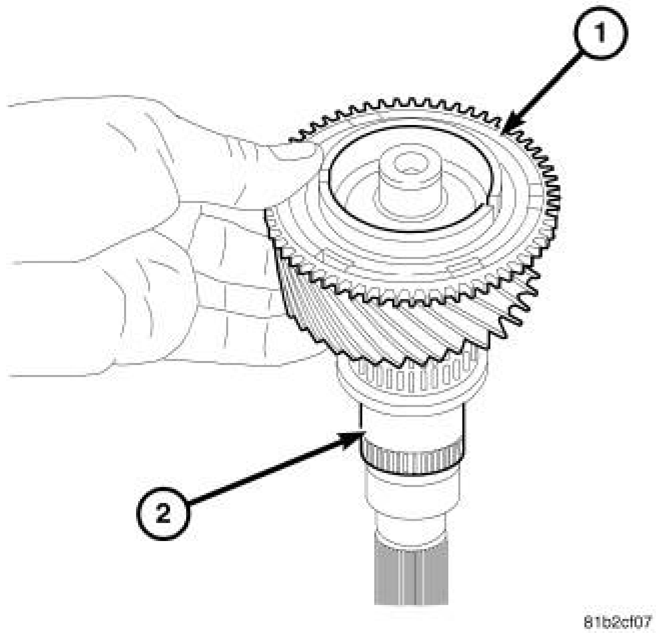


Fig. 147: 3rd Gear
Courtesy of CHRYSLER GROUP, LLC

3. Install third gear (1) on the mainshaft (2).

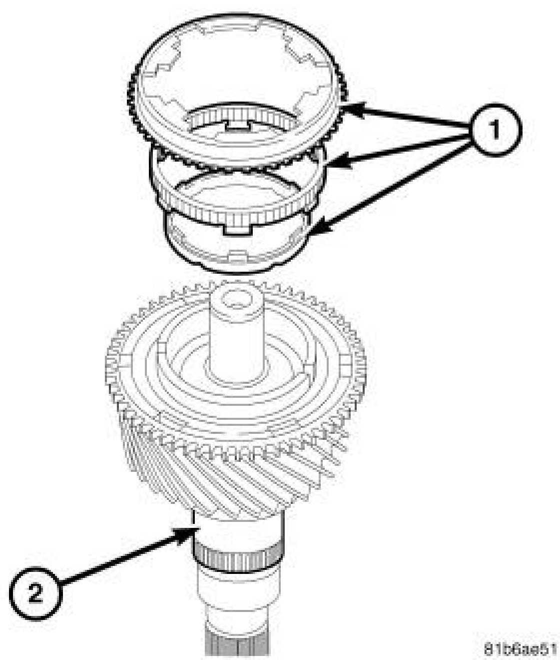

Fig. 148: 3rd Gear Synchro Rings
Courtesy of CHRYSLER GROUP, LLC

4. Install the third gear synchronizer rings (1) on the third gear (2).

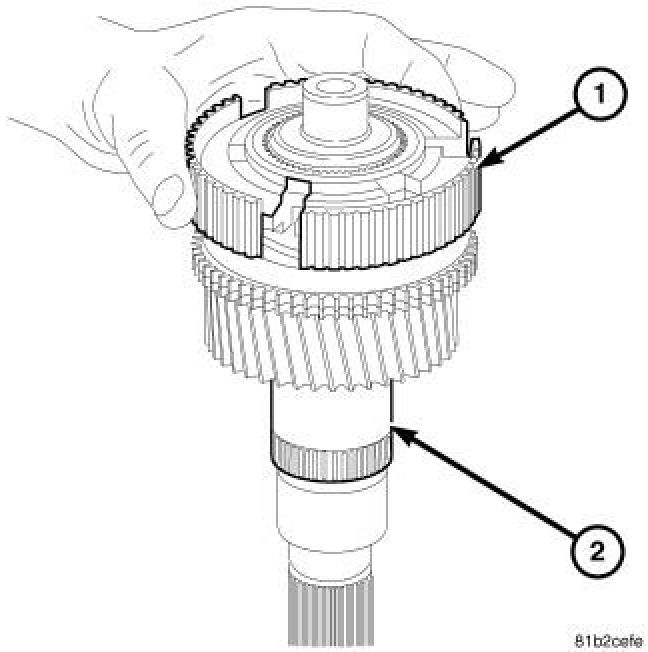

Fig. 149: 3-4 Synchro Hub
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Refer to the removal orientation noted of the third and fourth gear synchronizer hub orientation prior to installation. It is a directional hub and will not work properly if installed incorrectly.**

5. Install the third and fourth gear synchronizer hub (1) on the mainshaft (2).

CAUTION: **Synchronizer rings must be aligned with synchronizer hub and third gear during installation. Failure to follow these instructions will result in damage to the synchronizer rings.**

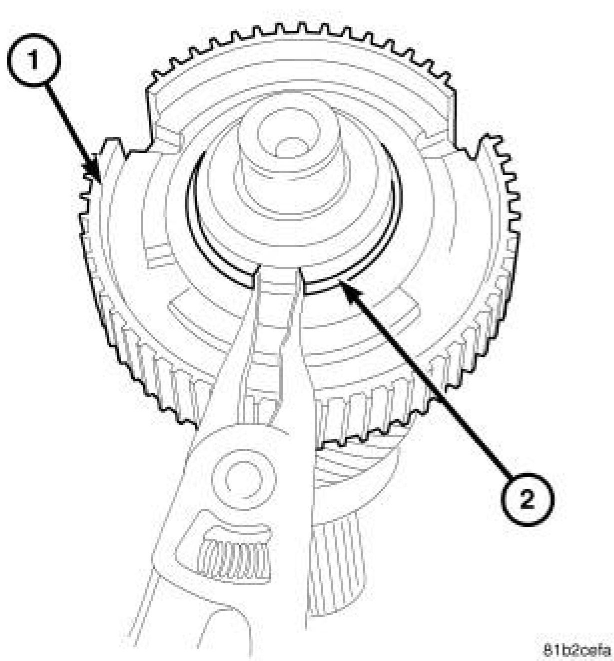

Fig. 150: 3-4 Hub Snap Ring

Courtesy of CHRYSLER GROUP, LLC

6. Install third and fourth gear synchronizer hub (1) snap ring (2) on the mainshaft.

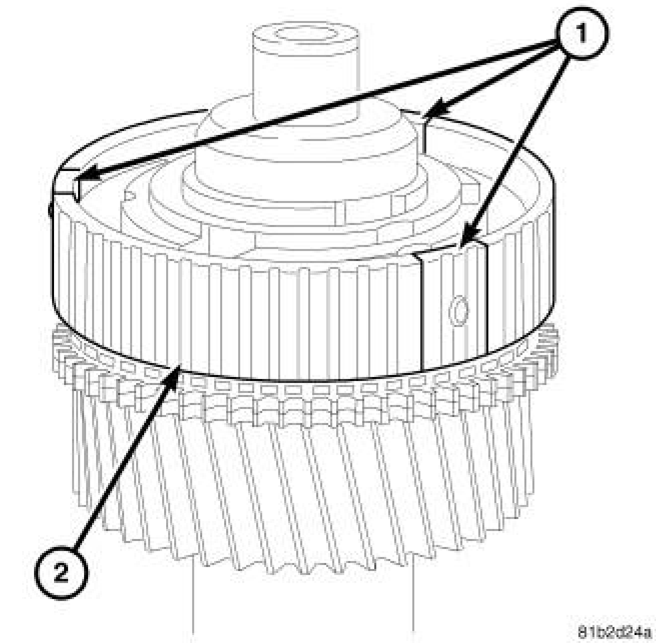

Fig. 151: 3-4 Hub Detents
Courtesy of CHRYSLER GROUP, LLC

7. Install the synchronizer detents (1) in the third and fourth gear synchronizer hub (2).

NOTE: **First and second gear and the third and fourth gear synchronizer detents are the same.**

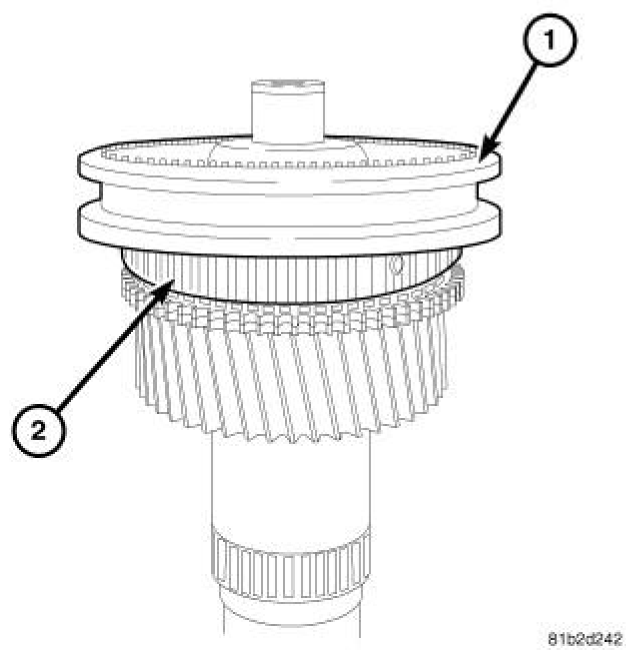

Fig. 152: 3-4 Synchro Sleeve
Courtesy of CHRYSLER GROUP, LLC

8. Install the third and fourth gear synchronizer sleeve (1) on the third and fourth gear synchronizer hub (2).

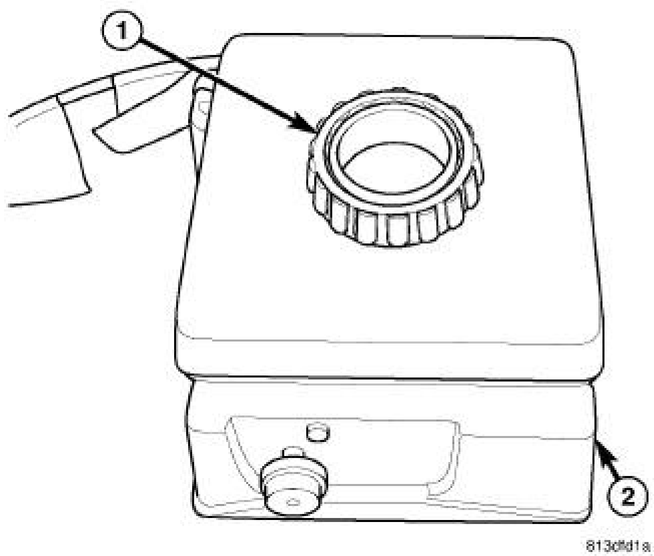

Fig. 153: Identifying Bearing Heater And Bearing
Courtesy of CHRYSLER GROUP, LLC

WARNING: Use tongs or welding gloves when handling heated components. Failure to follow these instructions will result in personal injury.

CAUTION: Bearings (1) are installed using a Bearing Heater (2). Use only a bearing heater/hot plate and follow manufacture's instructions. Heat components to 100 - 149 Celsius (212Ā° Min. - 300Ā° Max Fahrenheit). Never use an open flame to heat components. Never leave components on heater for an extended amount of time. If component is discolored after heating, the component has been overheated and must not be used. Failure to follow these instructions will result in component damage.

9. Heat the mainshaft transmission adapter bearing to 100Ā° - 149Ā°C (212Ā° - 300Ā°F) and install onto the mainshaft with tongs or welding gloves.

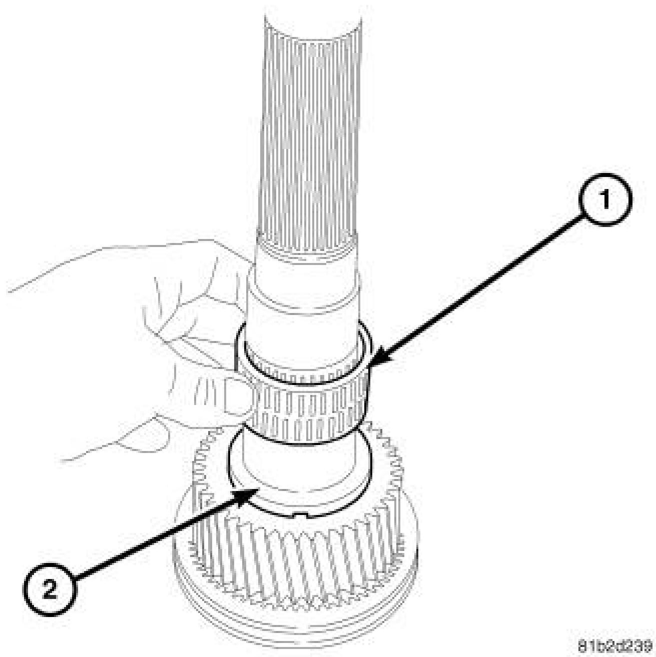

Fig. 154: 2nd Gear Bearing
Courtesy of CHRYSLER GROUP, LLC

10. Install the second gear bearing (1) on the mainshaft (2).

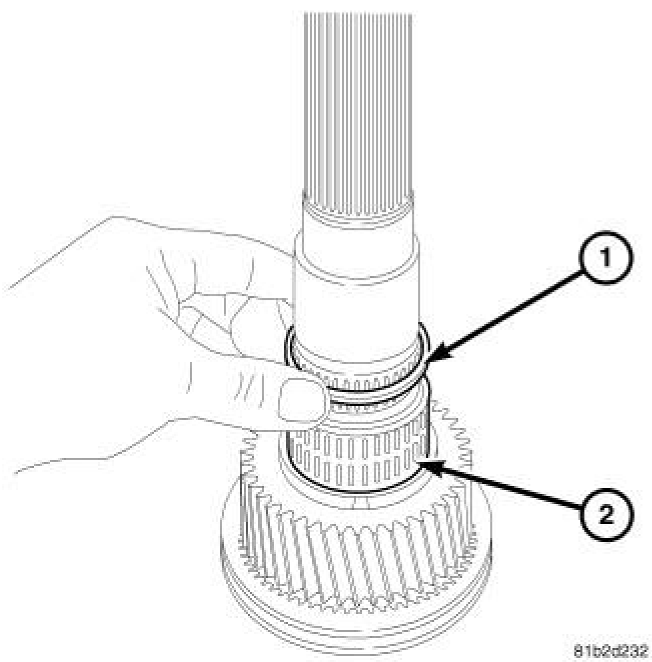

Fig. 155: 2nd Bearing Spacer
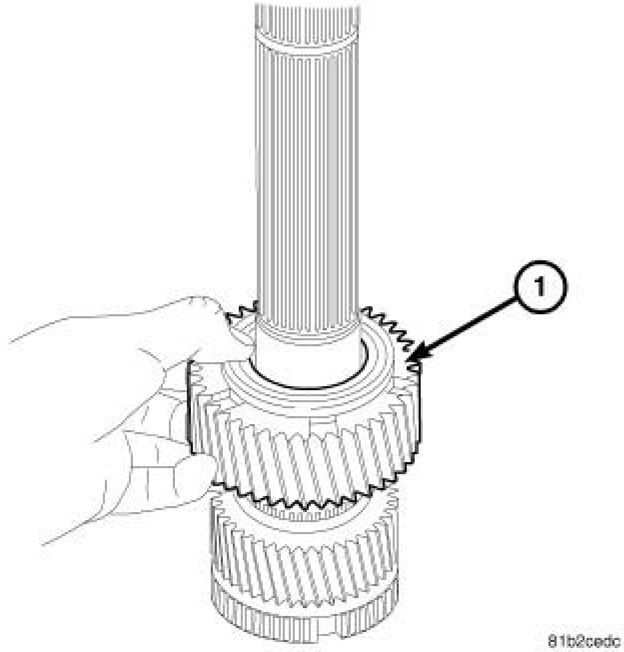
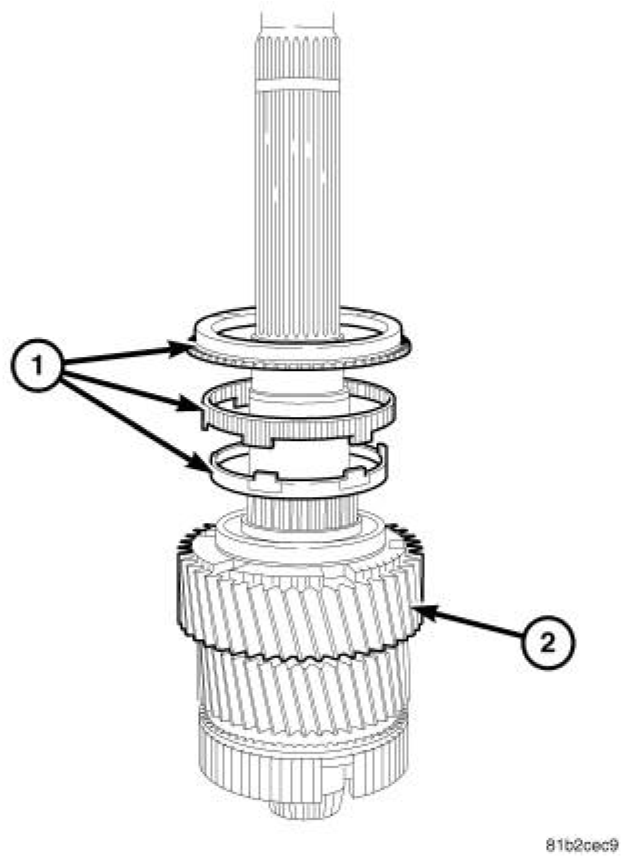
Courtesy of CHRYSLER GROUP, LLC

11. Install the second gear bearing spacer (1) on the mainshaft (2).



[Fig. 156: 2nd Gear](#)
Courtesy of CHRYSLER GROUP, LLC

12. Install second gear (1) on the mainshaft (2).



[Fig. 157: 2nd Gear Synchro Rings](#)
Courtesy of CHRYSLER GROUP, LLC

13. Install the second gear synchronizer rings (1) on the second gear (2).

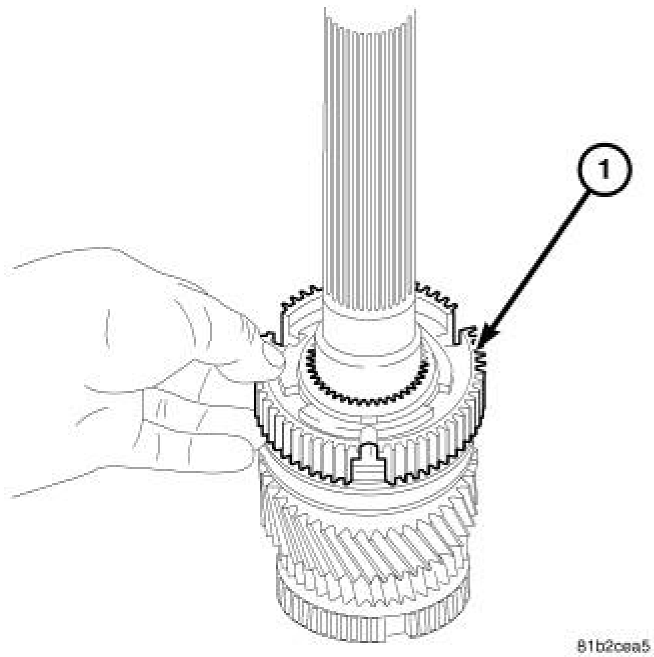


Fig. 158: 1-2 Synchro Hub
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Refer to the removal orientation noted of the first and second gear synchronizer hub orientation prior to installation. It is a directional hub and will not work properly if installed incorrectly.**

14. Install the first and second gear synchronizer hub (1) on the mainshaft (2).

CAUTION: **Synchronizer rings must be aligned with synchronizer hub and second gear during installation. Failure to follow these instructions will result in damage to the synchronizer rings.**

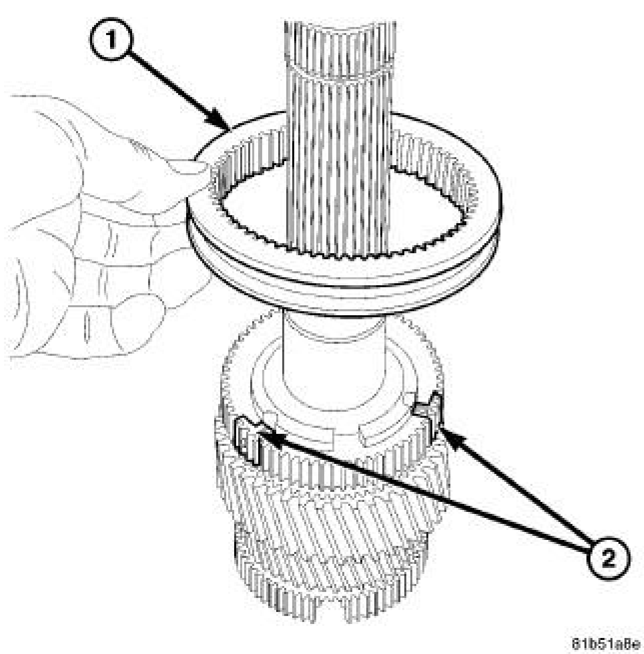

Fig. 159: 1-2 Synchro Sleeve
Courtesy of CHRYSLER GROUP, LLC

15. Install the first and second gear synchronizer hub sleeve (1) and detents (2).

NOTE: **The first and second gear and the third and fourth gear synchronizer detents are the same.**

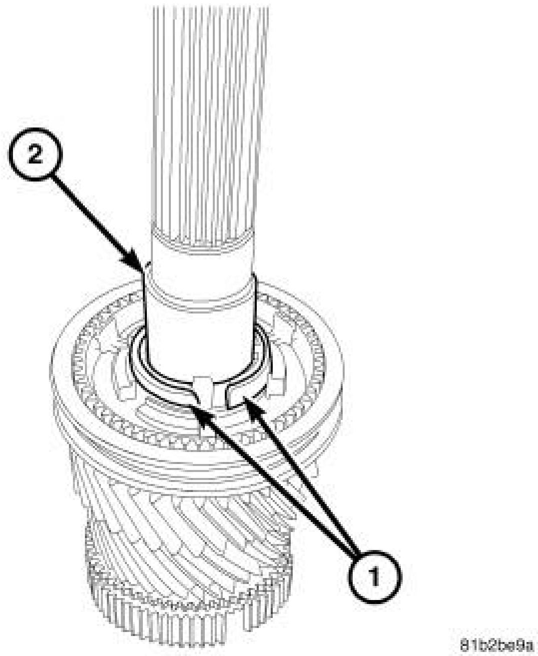

Fig. 160: 1st Split Rings
Courtesy of CHRYSLER GROUP, LLC

16. Install the first and second gear synchronizer hub split rings (1) on the mainshaft (2).

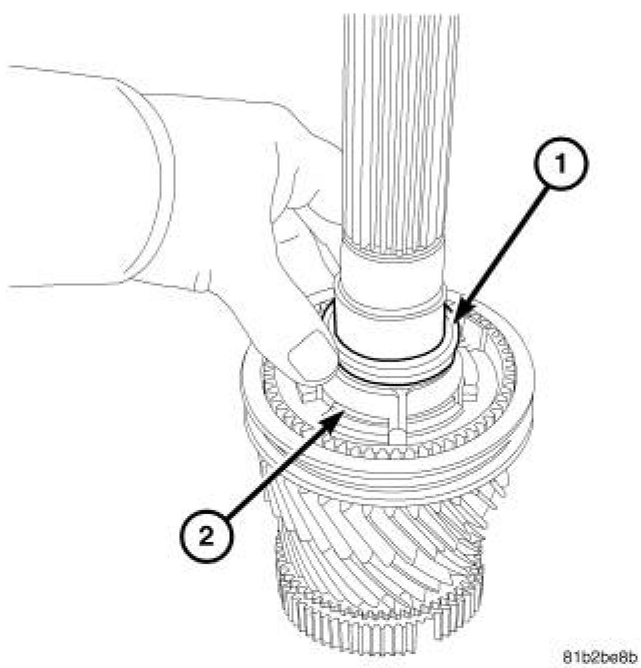

Fig. 161: 1st Split Ring Retainer

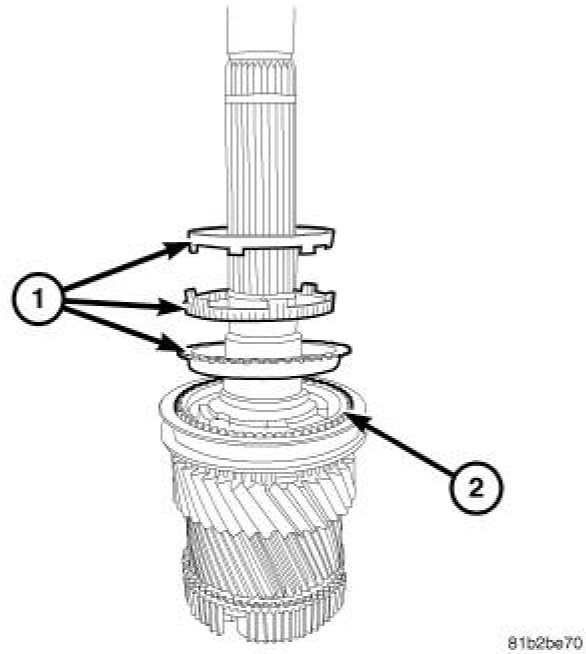
Courtesy of CHRYSLER GROUP, LLC

17. Install the first and second gear synchronizer hub split ring retainer (1) over the split rings (2).



[**Fig. 162: 1st Gear Synchro**]
Courtesy of CHRYSLER GROUP, LLC

18. Install the first gear synchronizer rings (1) on the first and second gear synchronizer hub (2).

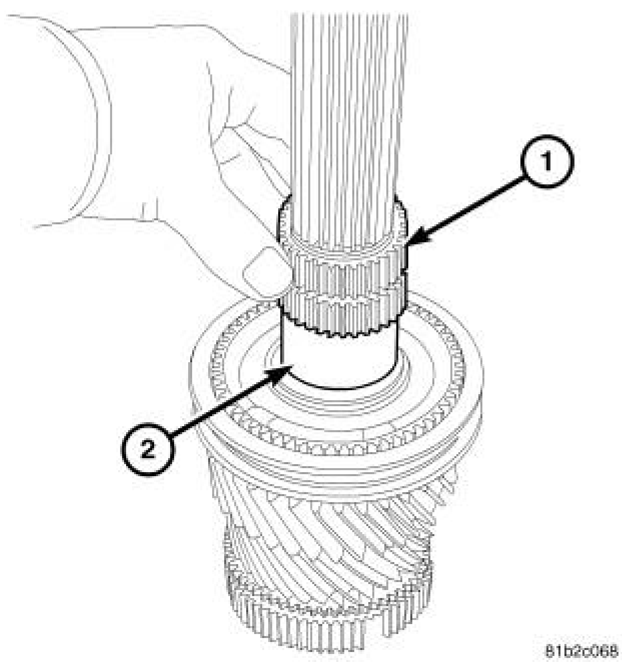


Fig. 163: 1st Gear Bearing & Mainshaft
Courtesy of CHRYSLER GROUP, LLC

19. Install the first gear bearing (1) on the mainshaft (2).

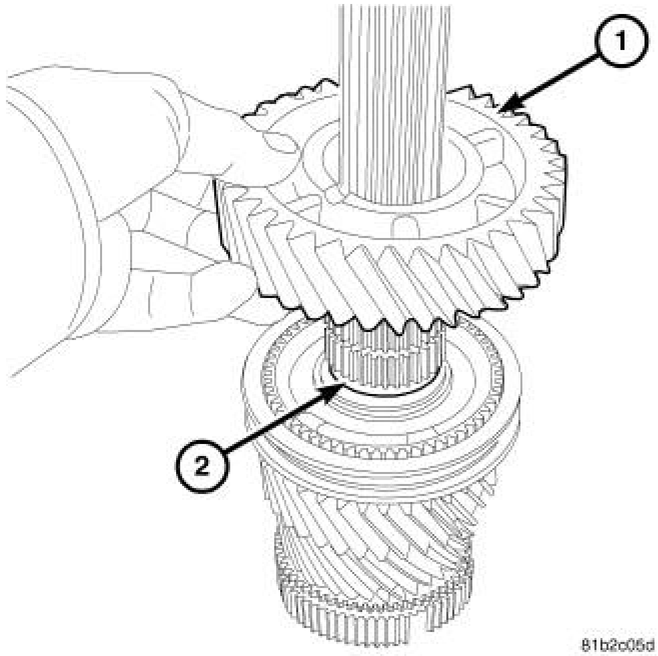

Fig. 164: 1st Gear & Mainshaft
Courtesy of CHRYSLER GROUP, LLC

20. Install first gear (1) on the mainshaft (2).

CAUTION: **Synchronizer rings must be aligned with synchronizer hub and first gear during installation. Failure to follow these instructions will result in damage to the synchronizer rings.**

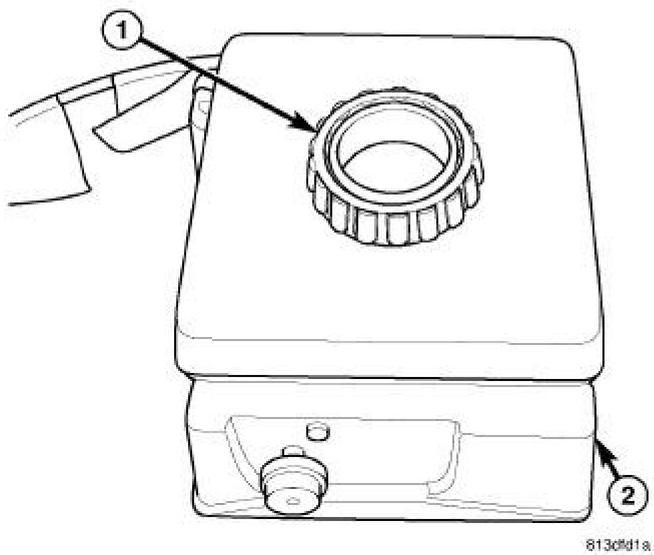

Fig. 165: Identifying Bearing Heater And Bearing
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Use tongs or welding gloves when handling heated components. Failure to follow these instructions will result in personal injury.**

CAUTION: Bearings (1) are installed using a Bearing Heater (2). Use only a bearing heater/hot plate and follow manufacture's instructions. Heat components to 100 - 149 Celsius (212Ā° Min. - 300Ā° Max Fahrenheit). Never use an open flame to heat components. Never leave components on heater for an extended amount of time. If component is discolored after heating, the component has been overheated and must not be used. Failure to follow these instructions will result in component damage.

21. Heat the mainshaft case bearing to 100Ā° - 149Ā° C (212Ā° - 300Ā°F) and install on the mainshaft with tongs or welding gloves.

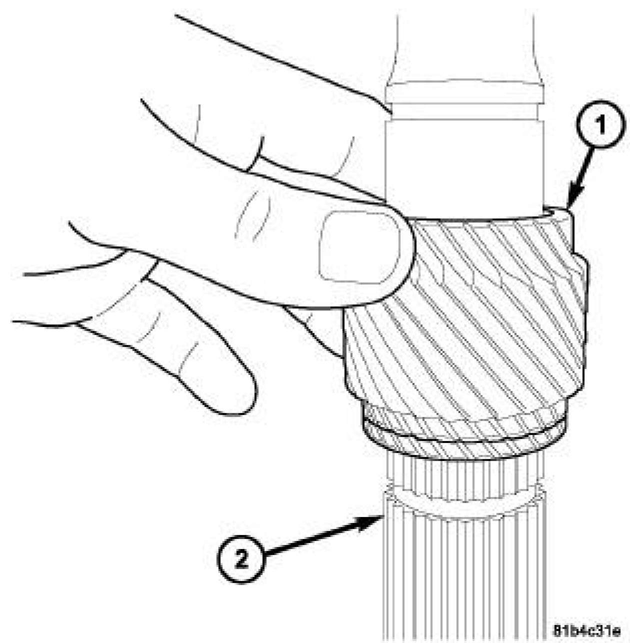

Fig. 166: Sixth Gear Mainshaft
Courtesy of CHRYSLER GROUP, LLC

22. Position sixth gear (1) on the mainshaft (2).
23. Install sixth gear on the mainshaft with Installer (special tool #9391, Installer, Gear) and Coupler (special tool #9391-2, Adapter, Coupling).

TRANSMISSION HOUSING

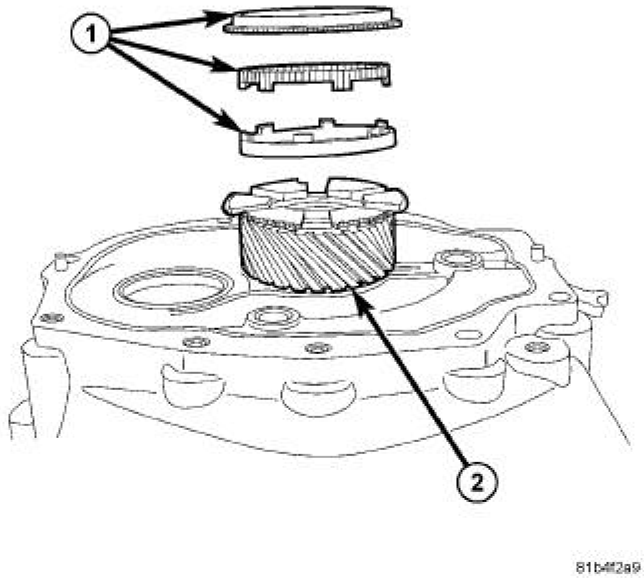

Fig. 167: Input Shaft Synchro Rings
Courtesy of CHRYSLER GROUP, LLC

1. Install the input shaft (2) into the transmission adapter plate. Install the fourth gear synchronizer rings (1) on the fourth gear.

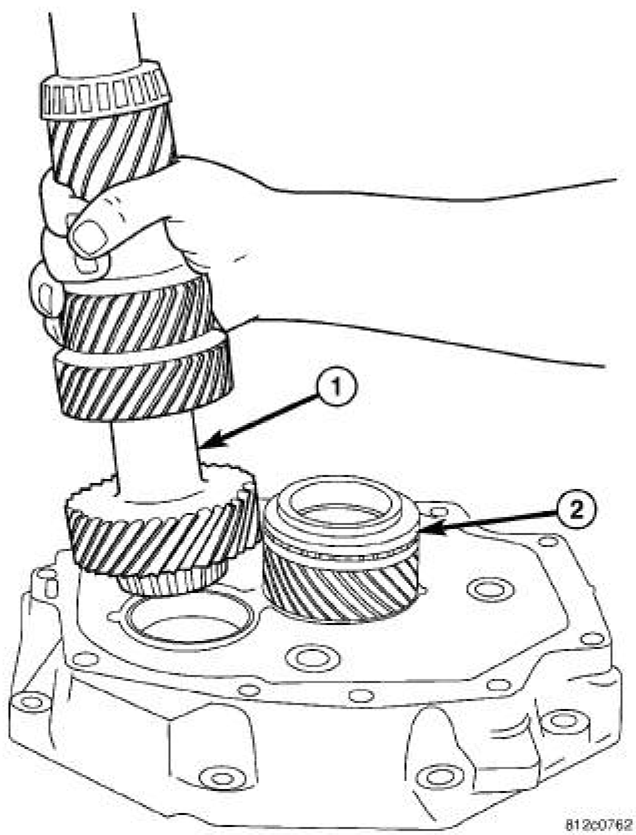

Fig. 168: Removing/Installing Countershaft

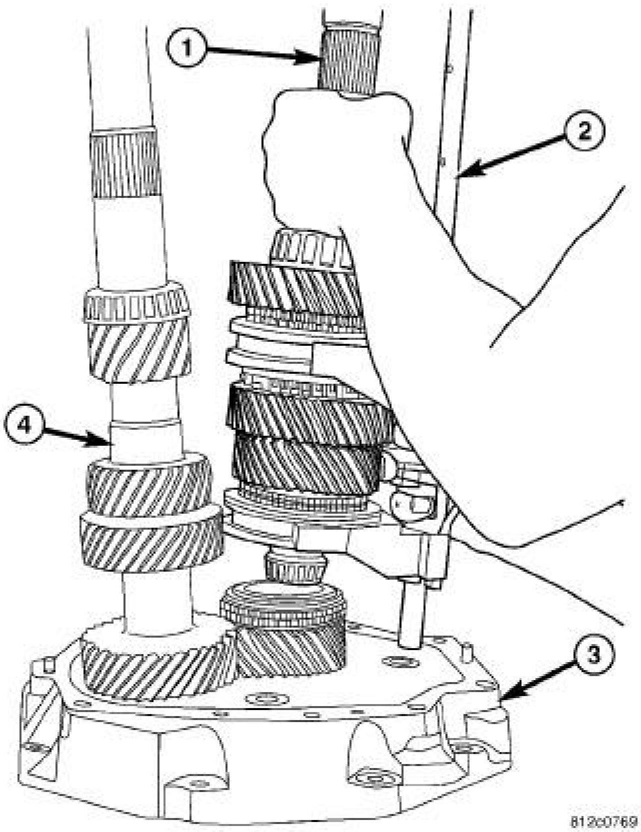
Courtesy of CHRYSLER GROUP, LLC

2. Install the countershaft (1) assembly into the transmission adapter.



[**Fig. 169: Tilting Mainshaft & Shift Rail**]
Courtesy of CHRYSLER GROUP, LLC

3. Tilt the countershaft (4) sideways then install the mainshaft (1) and shift rail (2) assemblies into the transmission adapter (3).

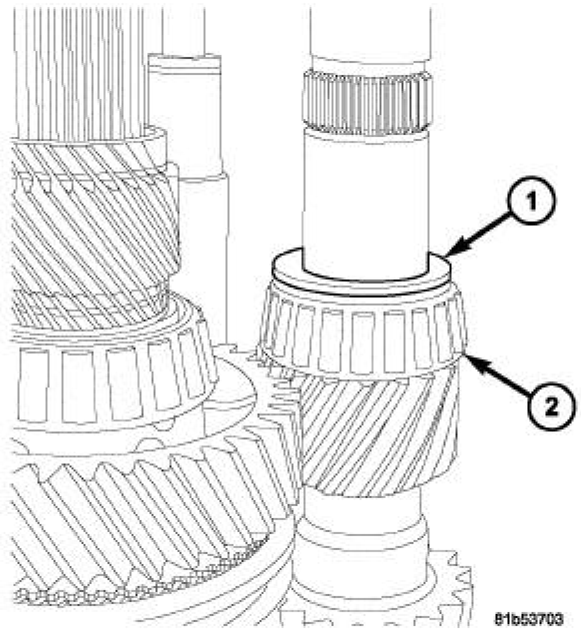


Fig. 170: Countershaft Washer
Courtesy of CHRYSLER GROUP, LLC

4. Install the countershaft thrust washer (1) on the countershaft (2).

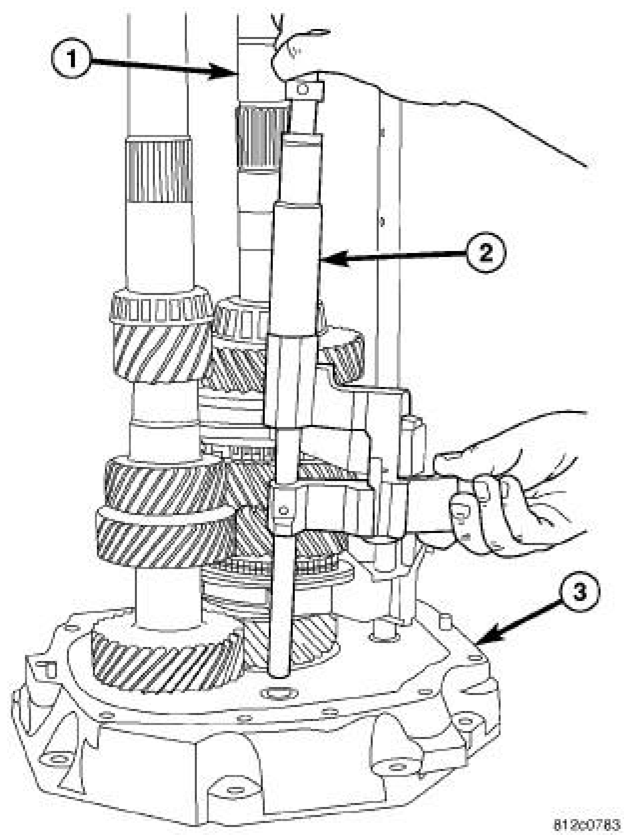

Fig. 171: Removing/Installing Reverse Shaft Rail Assembly
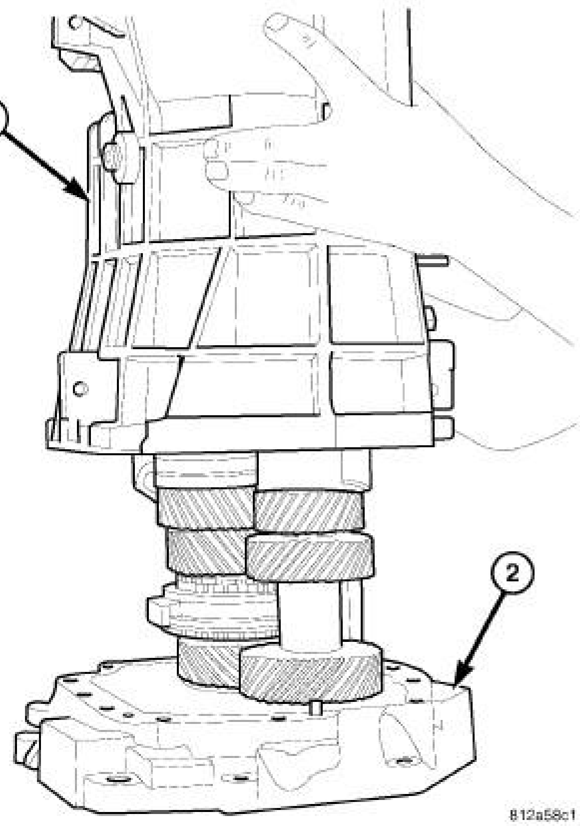
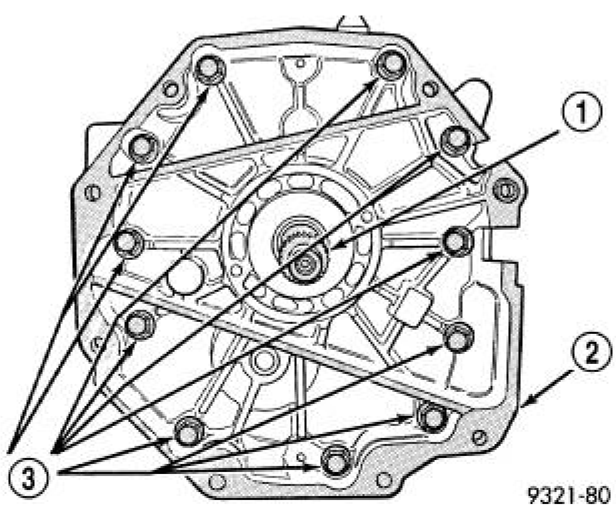
Courtesy of CHRYSLER GROUP, LLC

5. Install the reverse rail assembly (2) into the transmission adapter (3).



[Fig. 172: Transmission Case]
Courtesy of CHRYSLER GROUP, LLC

6. Apply Mopar Ā® ATF-RTV to the transmission adapter (2) sealing surface.
7. Install the transmission case (1) onto the gear set until the shift rail passes through the case bushing. Then install the skip shift lever on the shift rail and seat the transmission case on the adapter (2).



[Fig. 173: Adapter Bolts Location]
Courtesy of CHRYSLER GROUP, LLC

8. Install the transmission adapter (2) bolts (3) and tighten to the proper **SPECIFICATIONS** .

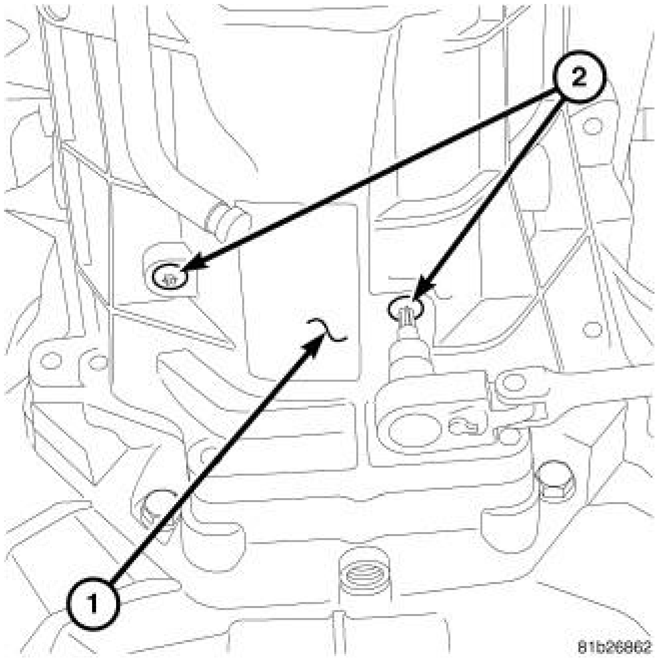


Fig. 174: Torx Screws
Courtesy of CHRYSLER GROUP, LLC

9. Apply Mopar Ā® Lock and Seal Adhesive to the shift lever guide bolts. Install the guide bolts (2) in the transmission case (1) and tighten to the proper **SPECIFICATIONS** .

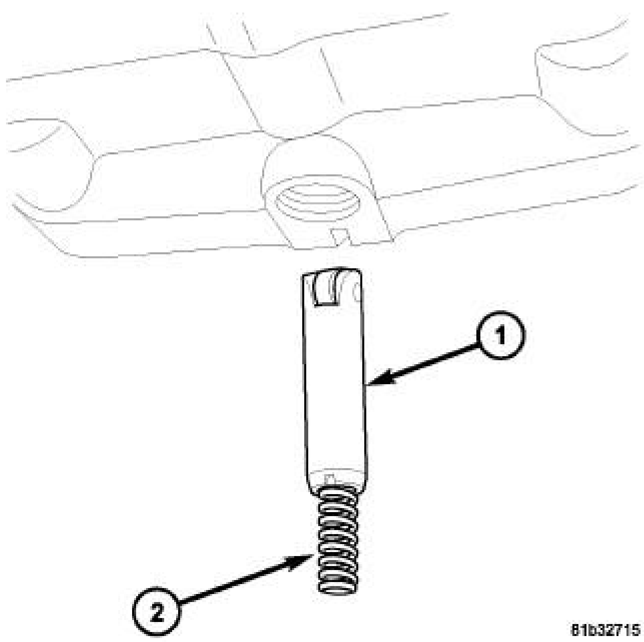

Fig. 175: Detent & Spring
Courtesy of CHRYSLER GROUP, LLC

10. Install the roller detent (1) and spring (2) into the transmission adapter.

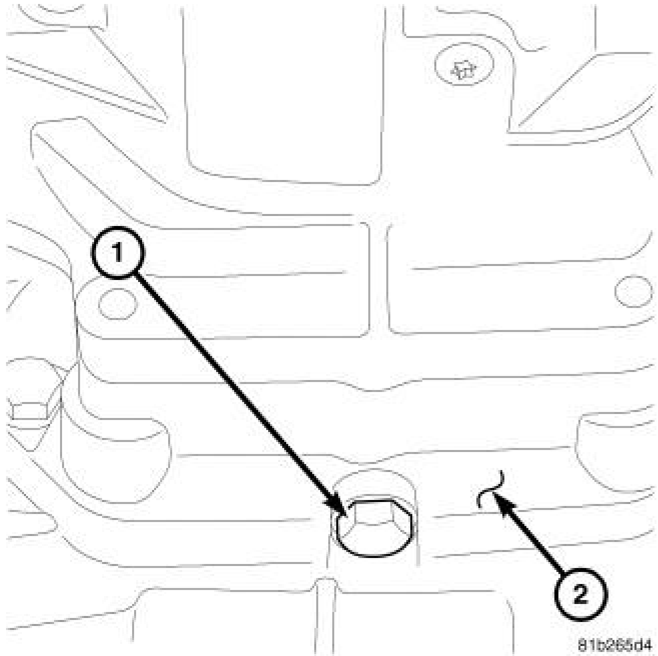

Fig. 176: Roller Detent Bolt & Transmission Adapter
Courtesy of CHRYSLER GROUP, LLC

11. Apply Mopar Ā® Lock and Seal to the roller detent bolt threads. Install the bolt (1) into the transmission adapter (2) and tighten to the proper SPECIFICATIONS .

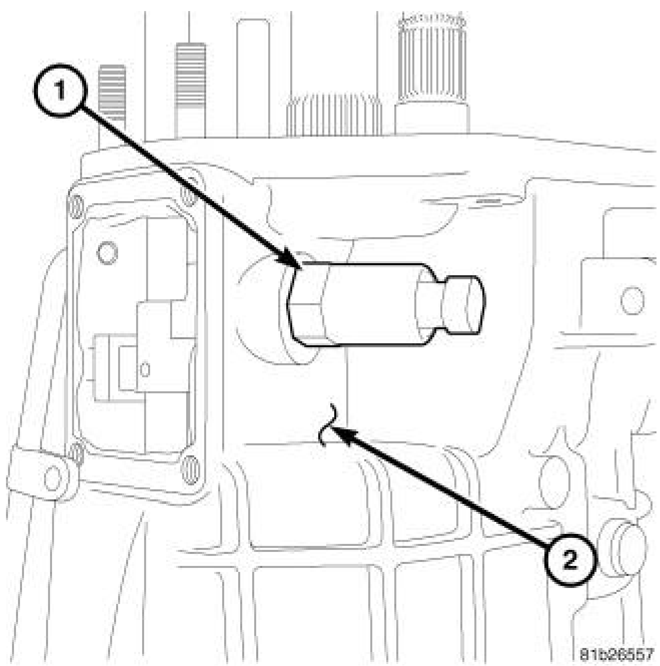

Fig. 177: Skip Shift Solenoid & Left Side Of Case
Courtesy of CHRYSLER GROUP, LLC

12. Install the skip shift solenoid (1) into the side of the case (2) and tighten to the proper SPECIFICATIONS .

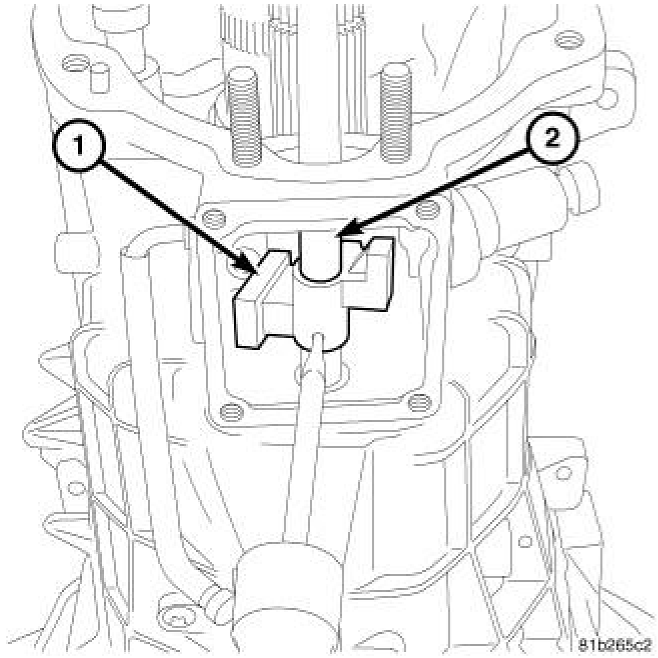

Fig. 178: Skip Shift Lever & Shift Rail
Courtesy of CHRYSLER GROUP, LLC

13. Install the skip shift lever (1) roll pin (2) with a hammer and punch.

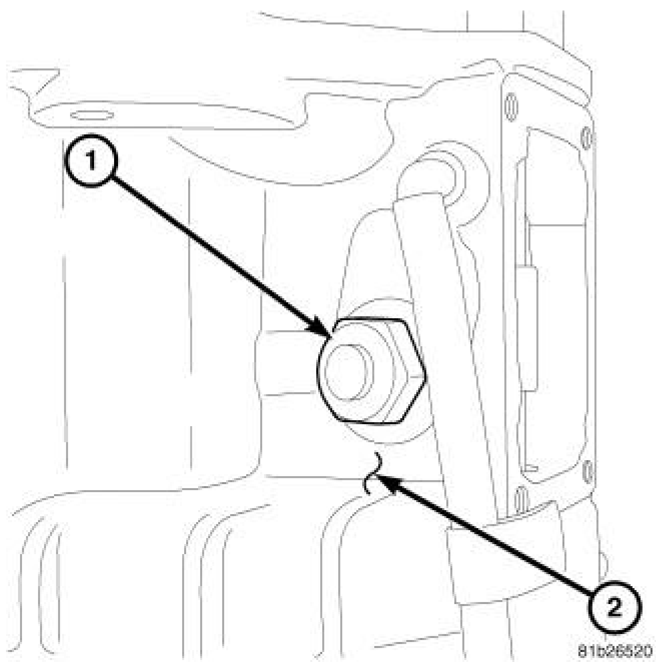

Fig. 179: Shift Detent & Right Side Of Case
Courtesy of CHRYSLER GROUP, LLC

14. Install the side shift detent (1) into the case (2) and tighten to the proper **SPECIFICATIONS** .

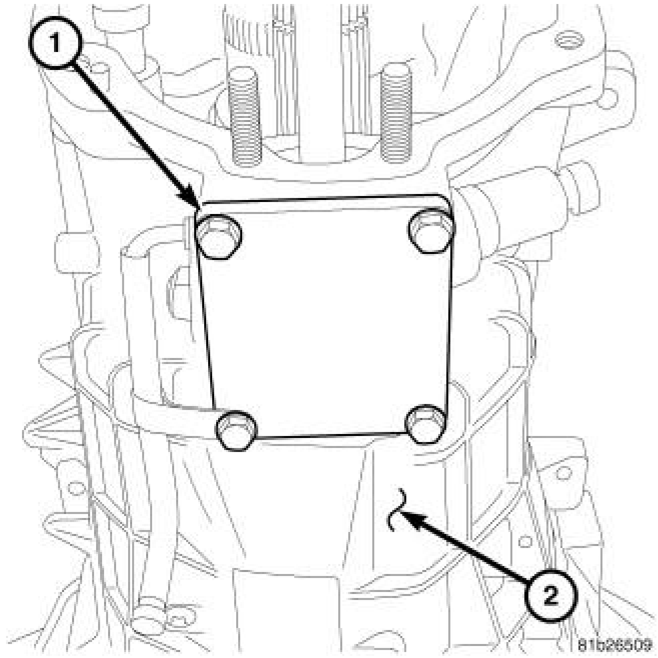

Fig. 180: Top Cover, Bolts & Transmission Case
Courtesy of CHRYSLER GROUP, LLC

15. Apply Mopar Ā® ATF-RTV to the top cover sealing surface.
16. Install the top cover (1) on the case (2) and tighten the bolts to the proper **SPECIFICATIONS** .

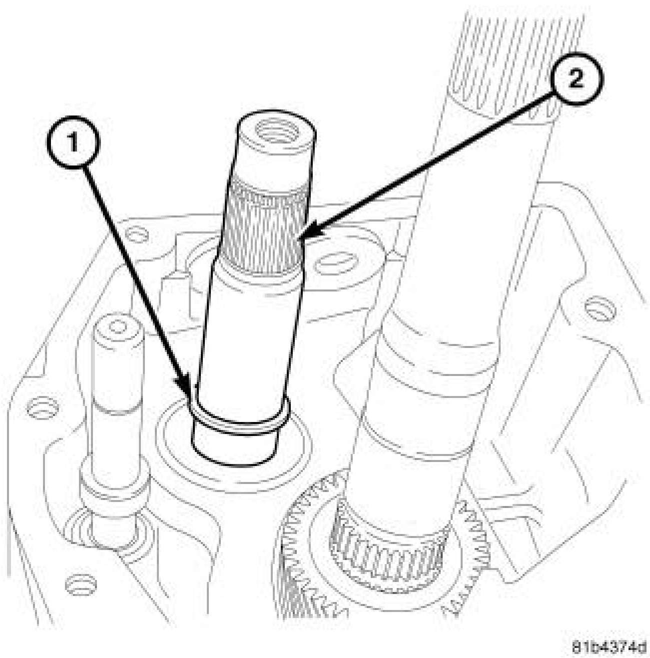

Fig. 181: 6th Gear Bearing Spacer & Countershaft
Courtesy of CHRYSLER GROUP, LLC

17. Install the sixth gear bearing spacer (1) on the countershaft (2).

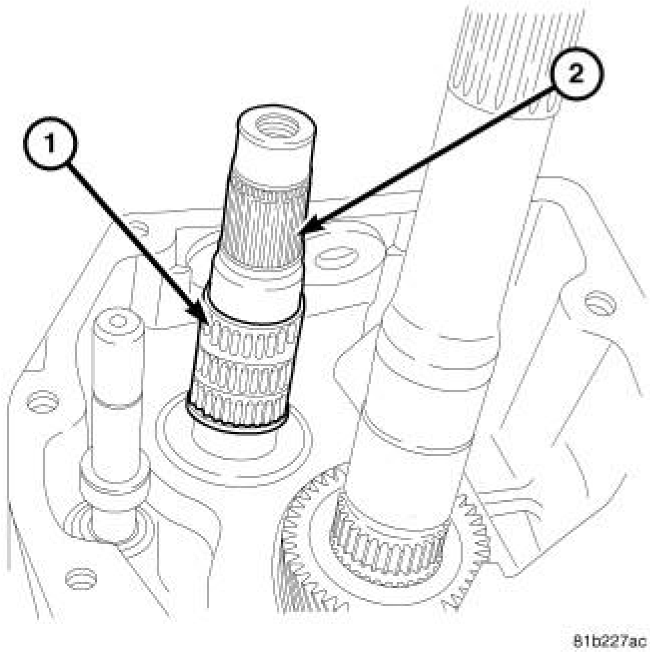

Fig. 182: 6th Gear Bearing & Countershaft
Courtesy of CHRYSLER GROUP, LLC

18. Install the sixth gear bearing (1) on the countershaft (2).

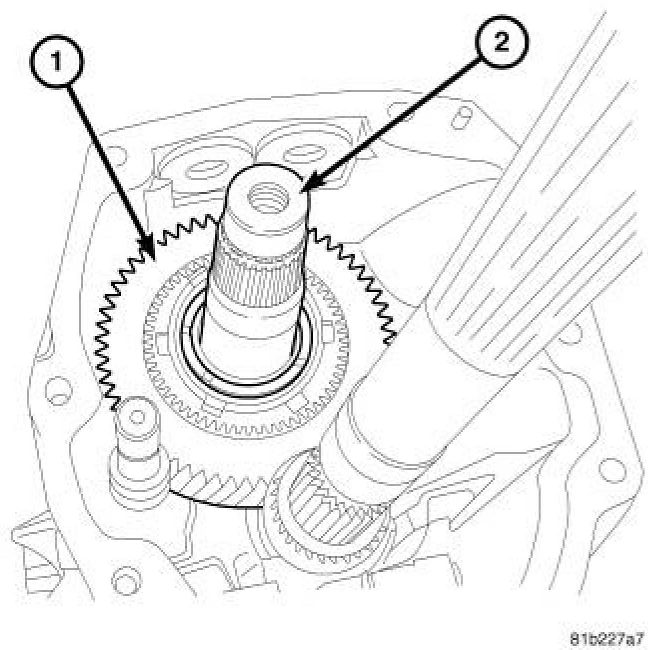

Fig. 183: 6th Gear & Countershaft
Courtesy of CHRYSLER GROUP, LLC

19. Install sixth gear (1) on the countershaft (2).

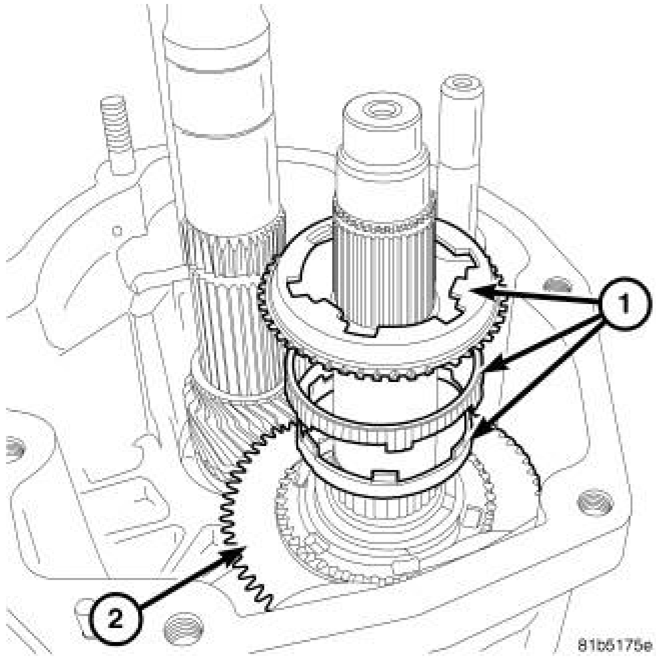

Fig. 184: 6th Synchro Rings
Courtesy of CHRYSLER GROUP, LLC

20. Install the sixth gear synchronizer rings (1) on the countershaft sixth gear (2).

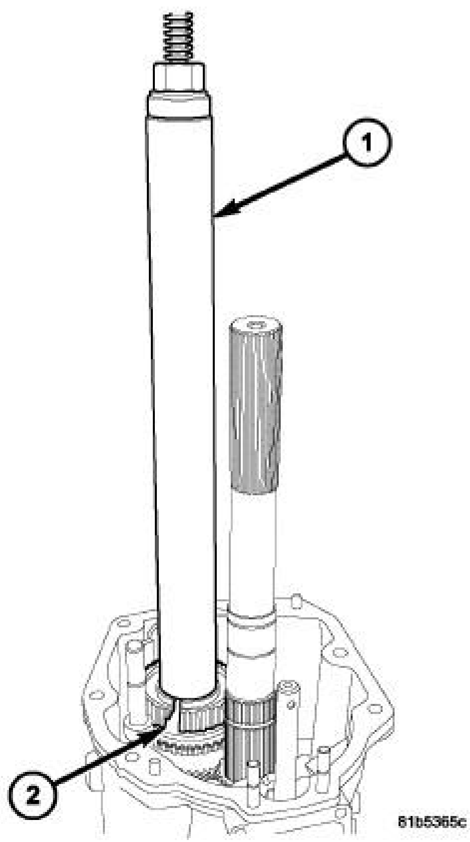

Fig. 185: 5-6 Hub Installer
Courtesy of CHRYSLER GROUP, LLC

21. Install the fifth and sixth gear synchronizer hub (2) on the countershaft with Installer (special tool #9391, Installer, Gear) (1).

CAUTION: Synchronizer rings must be aligned with synchronizer hub and sixth gear during installation. Failure to follow these instructions will result in damage to the synchronizer rings.

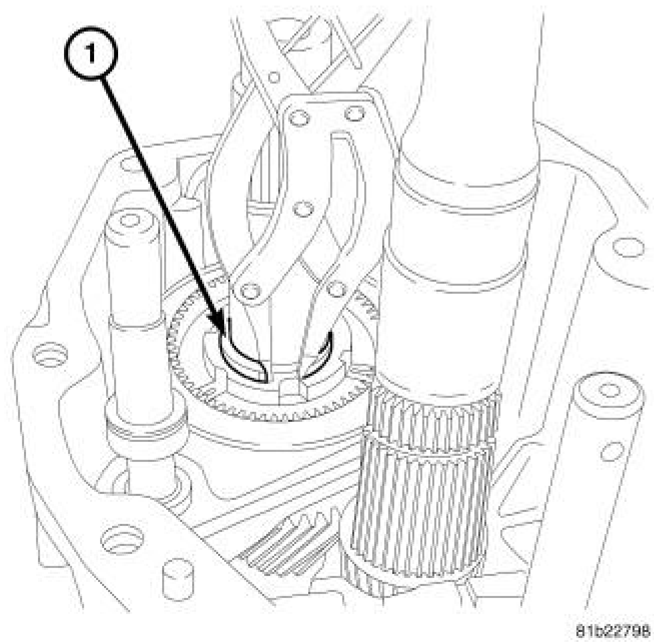

Fig. 186: 5-6 Hub Snap Ring
Courtesy of CHRYSLER GROUP, LLC

22. Install the fifth and sixth gear synchronizer hub (1) snap ring (2).

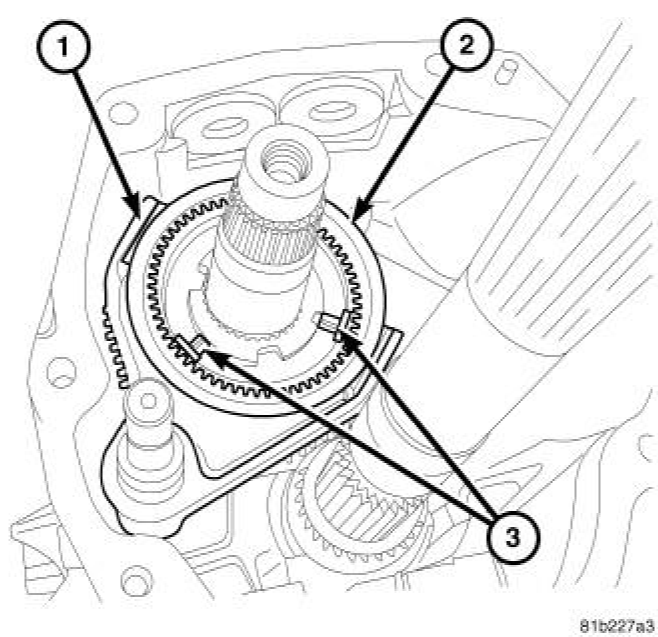

Fig. 187: 5-6 Fork & Sleeve
Courtesy of CHRYSLER GROUP, LLC

23. Install the fifth and sixth gear synchronizer shift fork (1) synchronizer sleeve (2) and the hub detents (3).

NOTE: **The fifth and sixth gear synchronizer detents and the reverse synchronizer detents are the same.**

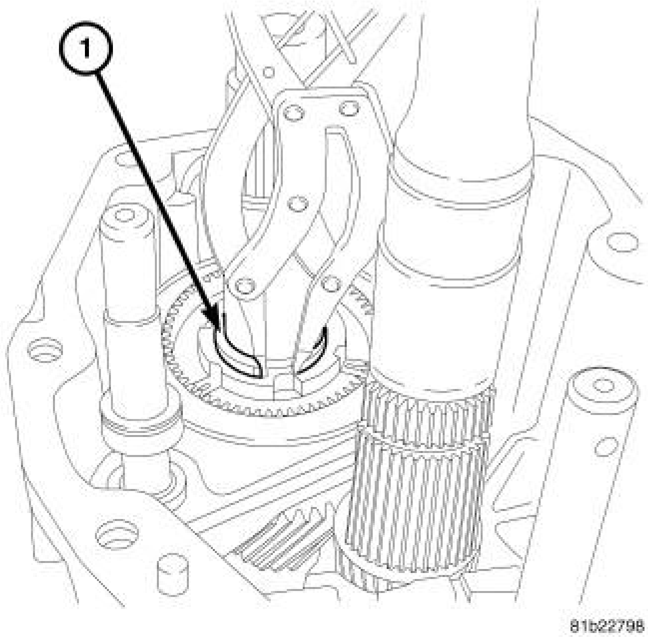

Fig. 188: 5-6 Hub Snap Ring
Courtesy of CHRYSLER GROUP, LLC

24. Install the fifth and sixth gear synchronizer hub snap ring (1).
25. Install a **NEW** fifth and sixth gear gear shift fork snap ring.

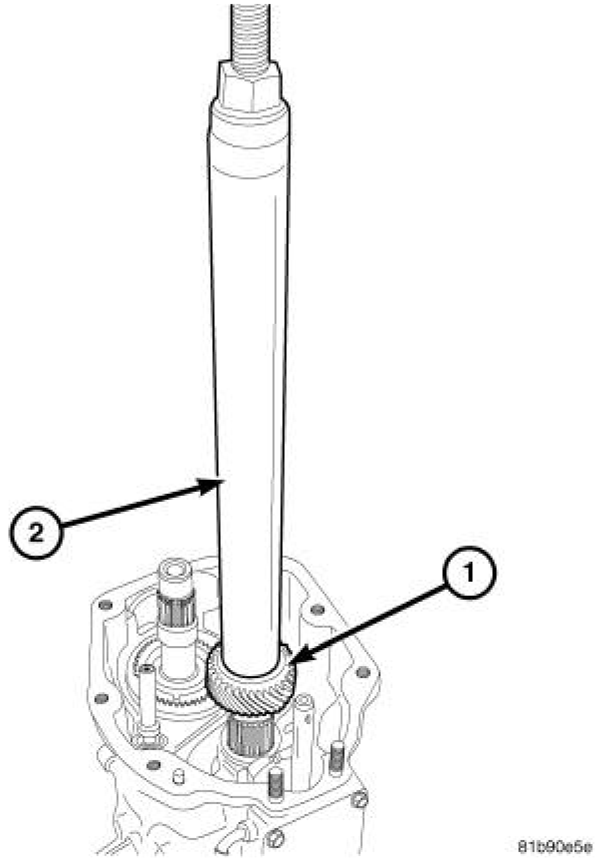

Fig. 189: 5th Gear Mainshaft
Courtesy of CHRYSLER GROUP, LLC

26. Install fifth gear (1) on the mainshaft with Installer (special tool #9391, Installer, Gear) (2) and Coupler (special tool #9391-2, Adapter, Coupling).

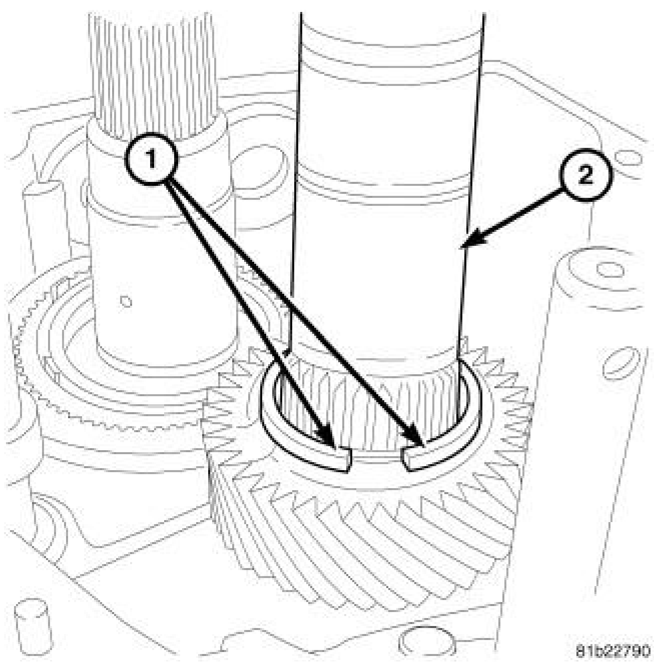

Fig. 190: 5th Gear Split Rings & Mainshaft
Courtesy of CHRYSLER GROUP, LLC

27. Install the fifth gear split rings (1) on the mainshaft (2).

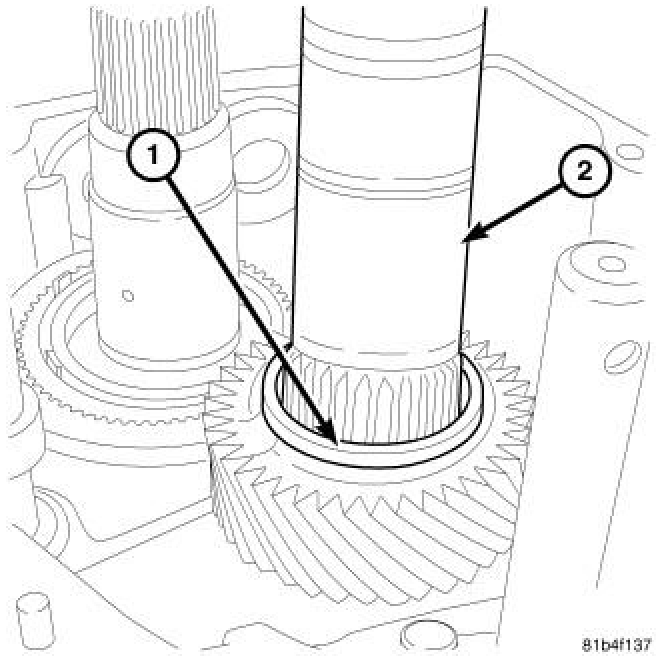

Fig. 191: 5th Gear Retainer Ring & Mainshaft
Courtesy of CHRYSLER GROUP, LLC

28. Install the fifth gear split ring retainer (1) on the mainshaft (2).

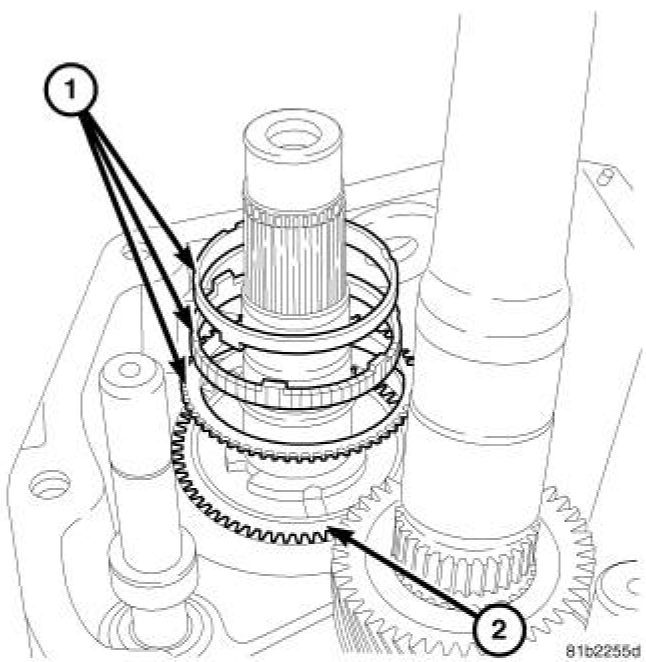

Fig. 192: Fifth Gear Synchro Rings & 5-6 Synchronizer Hub
Courtesy of CHRYSLER GROUP, LLC

29. Install the fifth gear synchronizer rings (1) on the fifth and sixth gear synchronizer hub (2).

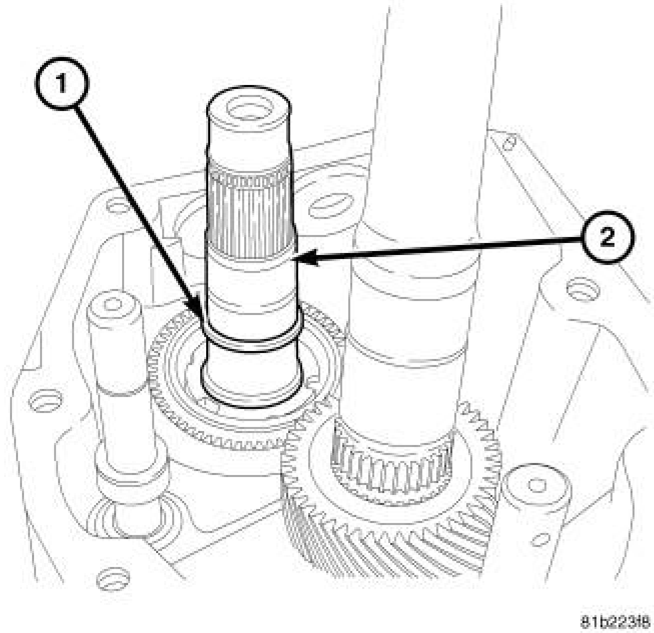

Fig. 193: 5th Gear Bearing Spacer & Countershaft
Courtesy of CHRYSLER GROUP, LLC

30. Install the fifth gear bearing spacer (1) on the countershaft (2).

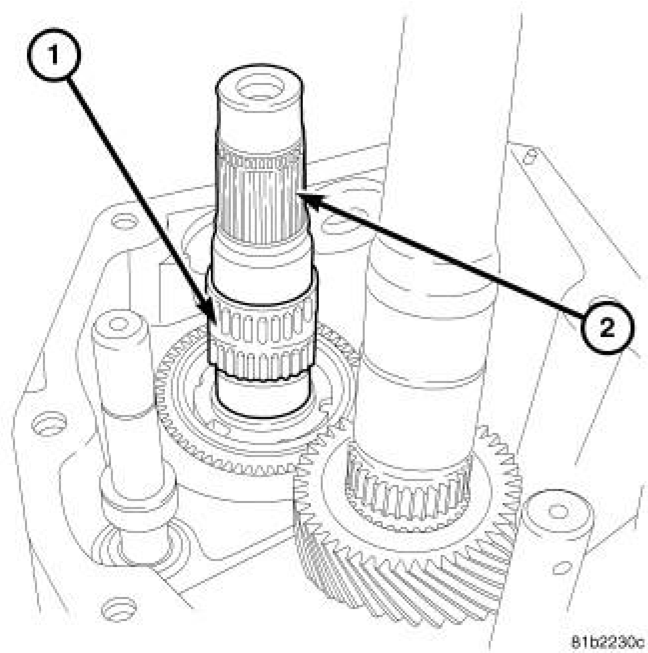

Fig. 194: 5th Gear Bearing & Countershaft
Courtesy of CHRYSLER GROUP, LLC

31. Install the fifth gear bearing (1) on the countershaft (2).

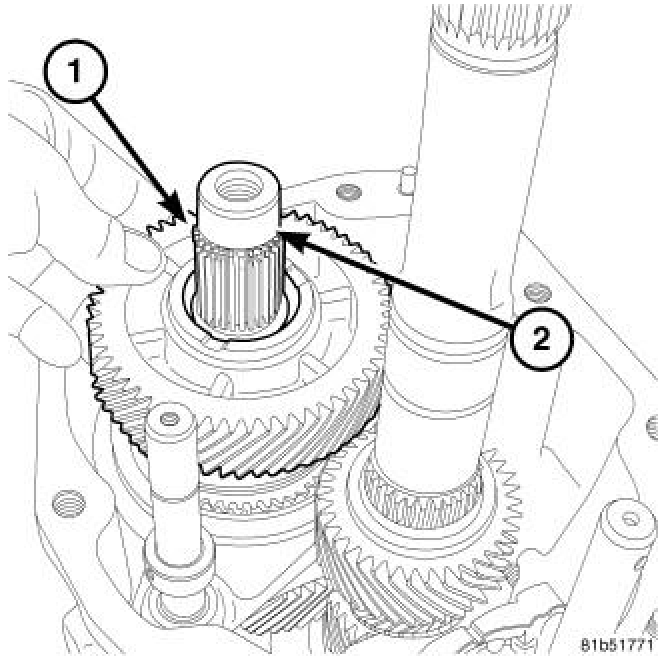

Fig. 195: 5th Gear & Countershaft
Courtesy of CHRYSLER GROUP, LLC

32. Install fifth gear (1) on the countershaft (2).

CAUTION: Synchronizer rings must be aligned with synchronizer hub and fifth gear during installation. Failure to follow these instructions will result in damage to the synchronizer rings.

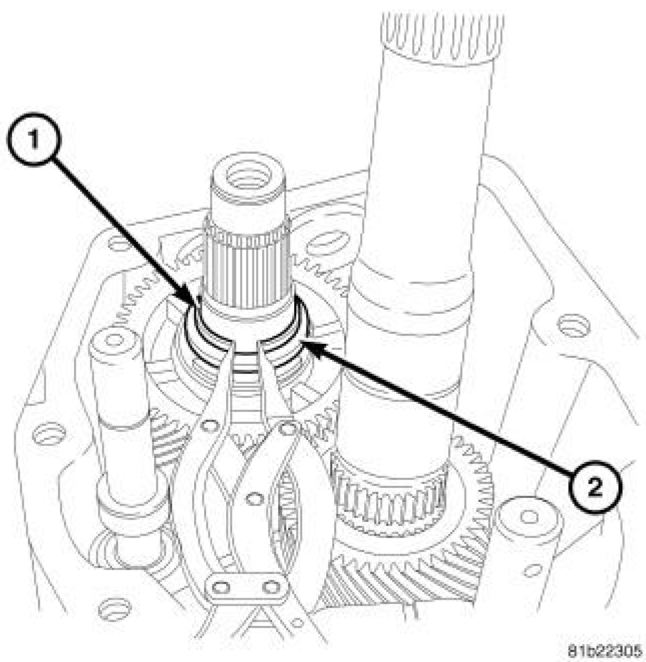

Fig. 196: 5th Gear Snap Ring & Countershaft
Courtesy of CHRYSLER GROUP, LLC

33. Install the fifth gear thrust washer (2) and snap ring (1) on the countershaft.

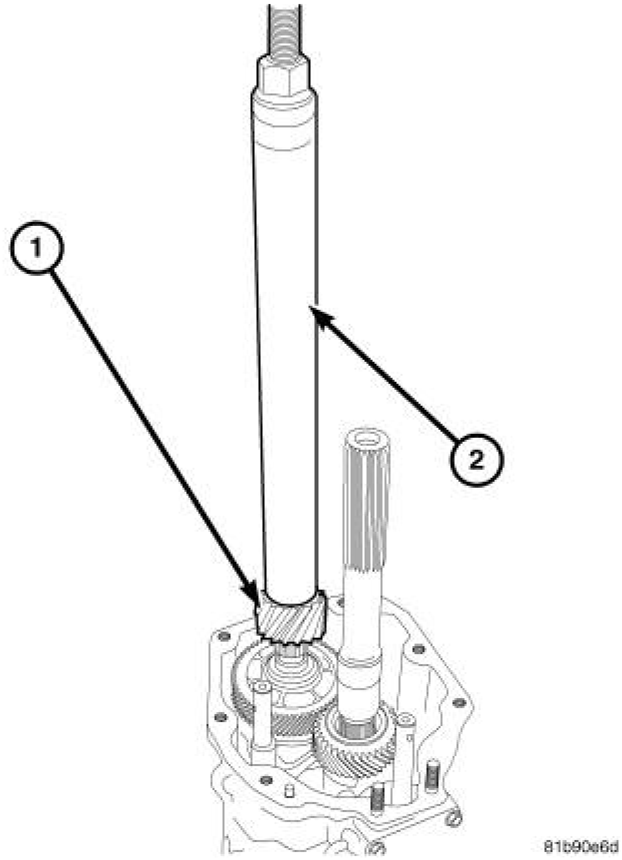

Fig. 197: Reverse Gear Countershaft
Courtesy of CHRYSLER GROUP, LLC

34. Install reverse gear (1) on the countershaft with Installer (special tool #9391, Installer, Gear) (2).

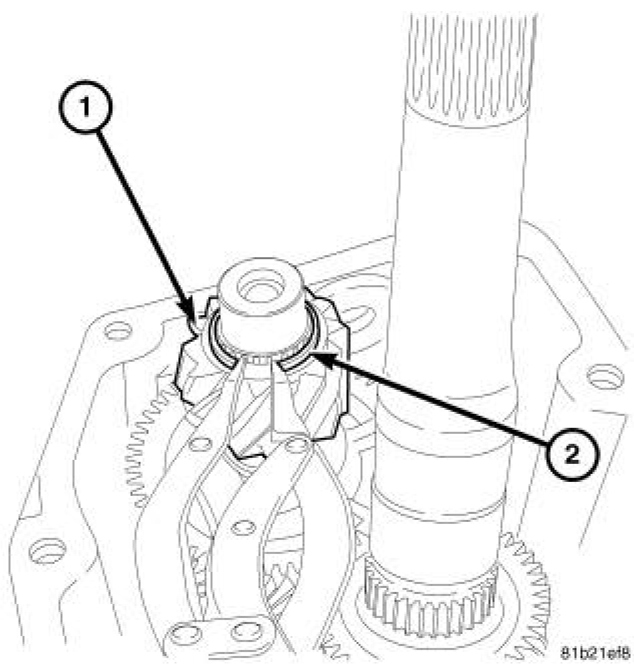

Fig. 198: Reverse Countershaft Snap Ring
Courtesy of CHRYSLER GROUP, LLC

35. Install the reverse gear (1) snap ring (2) on the countershaft.

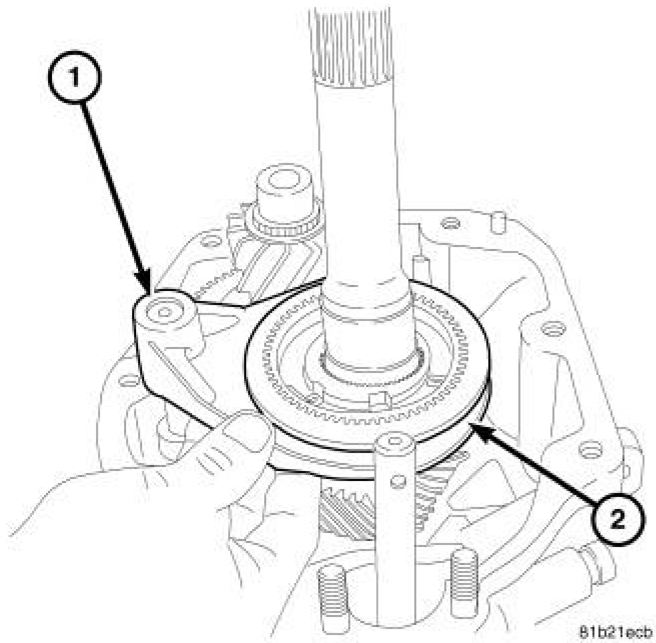

Fig. 199: Reverse Hub & Fork
Courtesy of CHRYSLER GROUP, LLC

36. Install the reverse gear shift fork (1), synchronizer hub with detents (2) and sleeve.

NOTE: **The fifth and sixth gear and the reverse gear synchronizer detents are the same.**

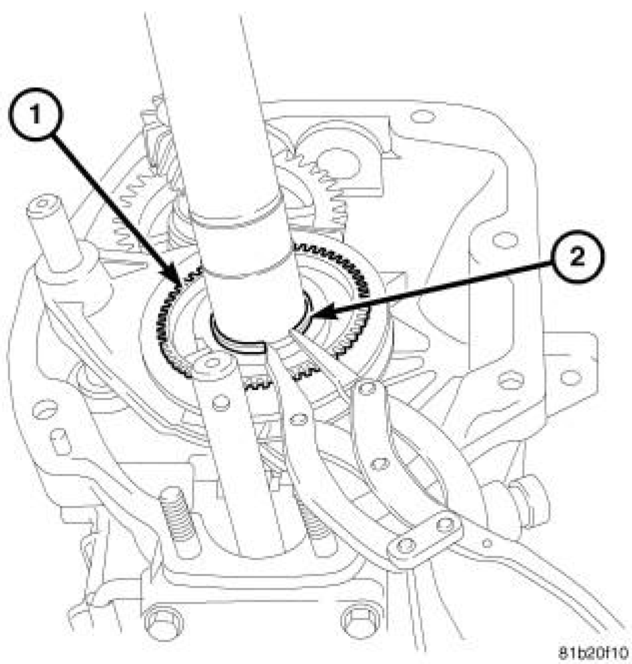

Fig. 200: Reverse Synchronizer Snap Ring
Courtesy of CHRYSLER GROUP, LLC

37. Install the reverse gear synchronizer hub (1) snap ring (2).

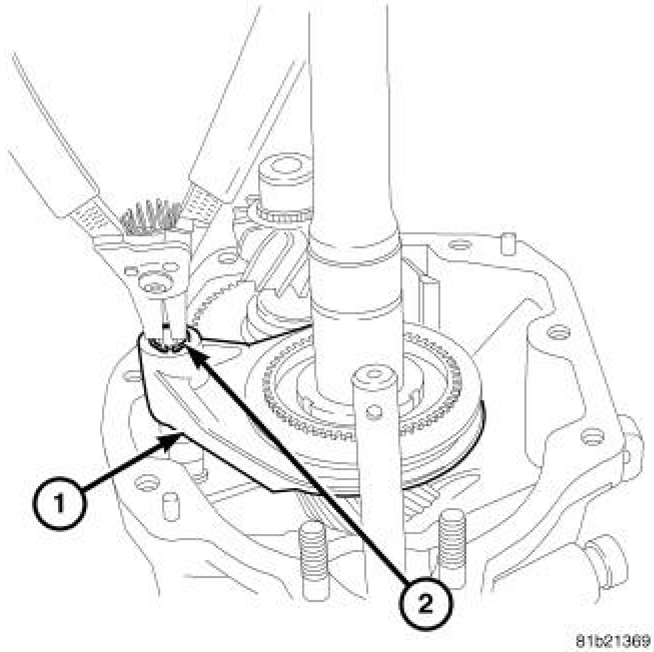

Fig. 201: Reverse Fork Snap Ring
Courtesy of CHRYSLER GROUP, LLC

38. Install a **NEW** reverse gear shift fork (1) snap ring (2).

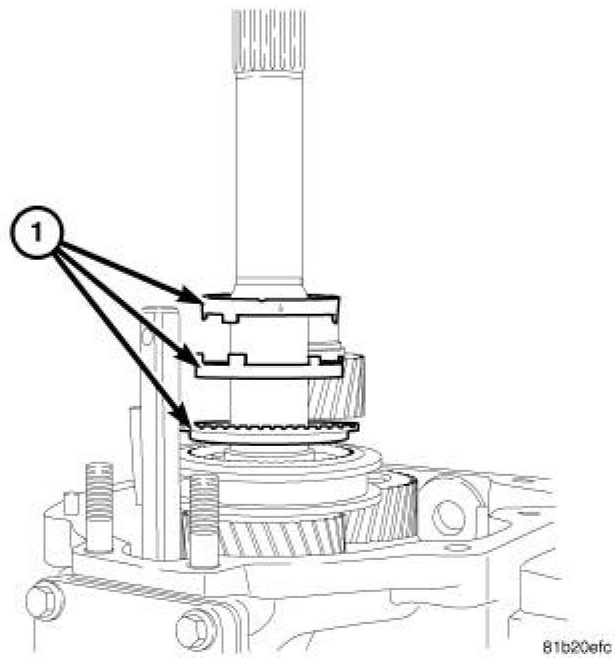

Fig. 202: Reverse Synchronizer Rings
Courtesy of CHRYSLER GROUP, LLC

39. Install the reverse gear synchronizer rings (1) on the reverse gear synchronizer hub.

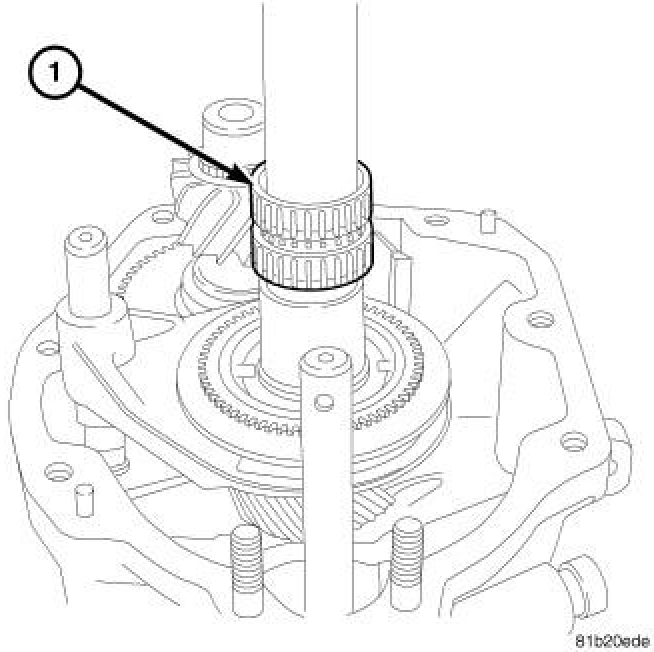

Fig. 203: Reverse Gear Bearing
Courtesy of CHRYSLER GROUP, LLC

40. Install the reverse gear bearing (1) on the mainshaft.

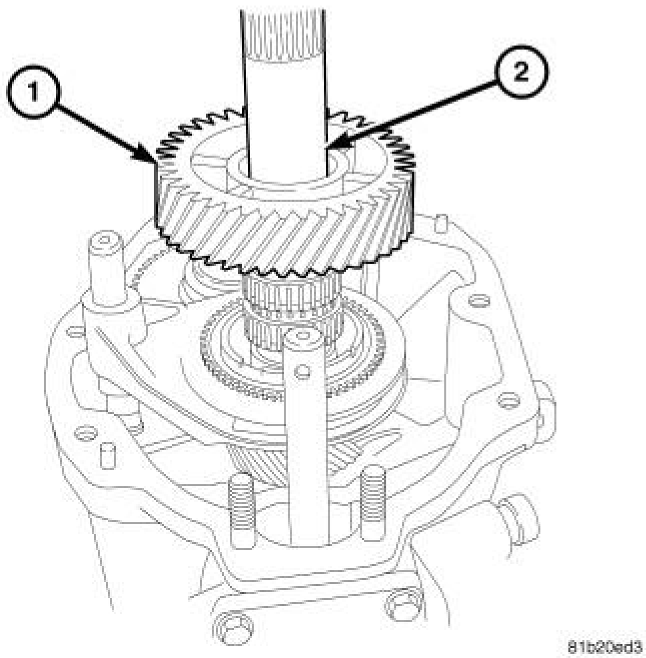

Fig. 204: Reverse Gear & Mainshaft
Courtesy of CHRYSLER GROUP, LLC

41. Install reverse gear (1) on the mainshaft (2).

CAUTION: Synchronizer rings must be aligned with synchronizer hub and reverse gear during installation. Failure to follow these instructions will result in damage to the synchronizer rings.

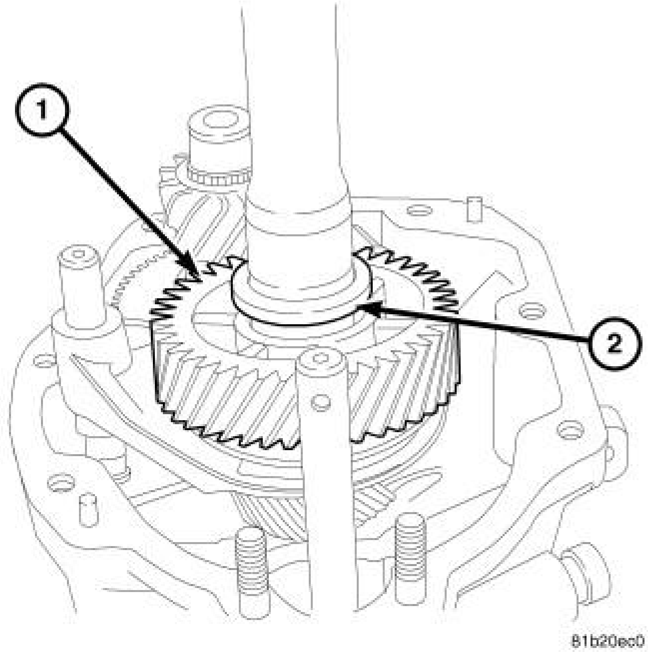

Fig. 205: Reverse Gear Thrust Washer
Courtesy of CHRYSLER GROUP, LLC

42. Install the reverse gear (1) thrust washer (2) on the mainshaft.

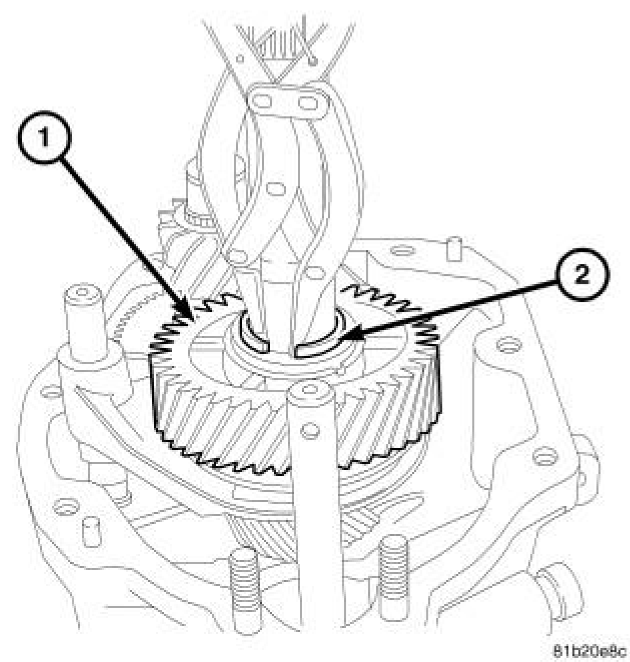

Fig. 206: Reverse Gear Snap Ring
Courtesy of CHRYSLER GROUP, LLC

43. Install the reverse gear (1) snap ring (2) on the mainshaft.

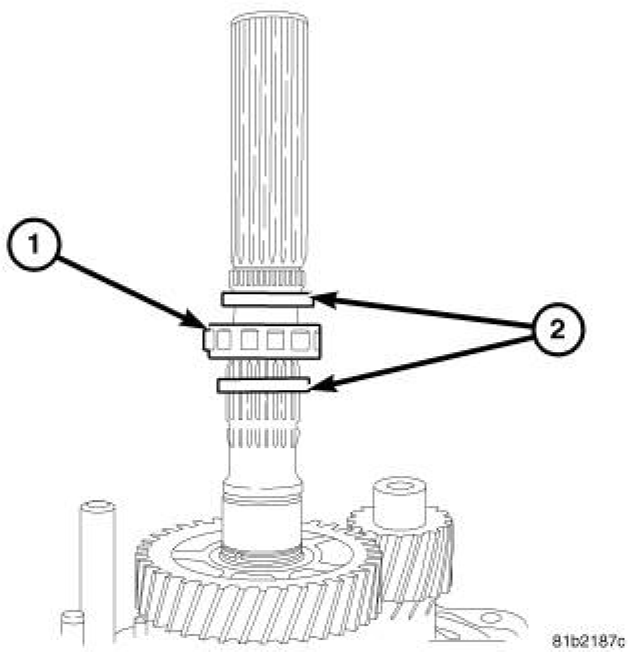

Fig. 207: Roller Bearing & Spacers
Courtesy of CHRYSLER GROUP, LLC

44. Install the mainshaft roller bearing (1) and spacers (2) on the mainshaft.

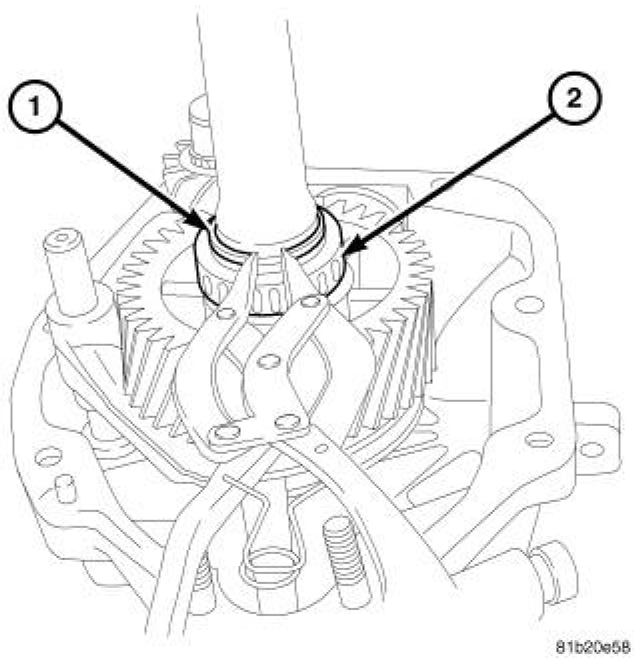

Fig. 208: Roller Bearing Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

45. Install the mainshaft roller bearing (2) snap ring (1).

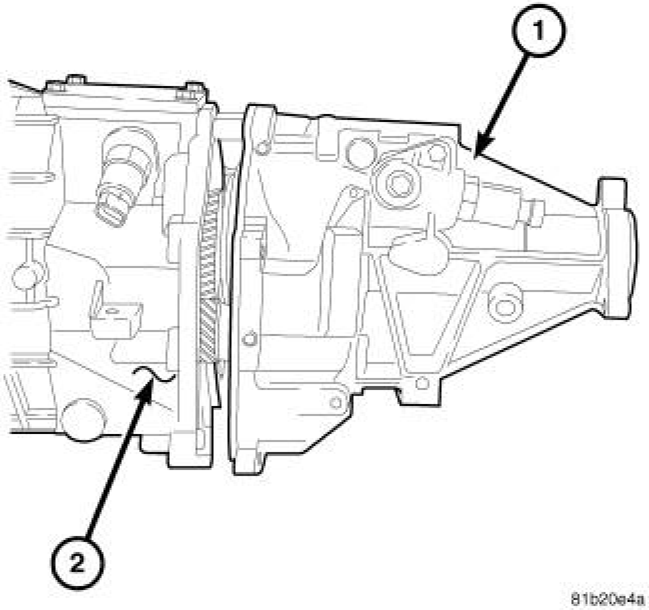

Fig. 209: Removing/Installing Extension Housing
Courtesy of CHRYSLER GROUP, LLC

46. If equipped, apply Mopar Ā® ATF-RTV to the extension housing sealing surface.

    If equipped with a gasket, install a **NEW** gasket.

47. Install the extension housing (1) on the transmission case (2).

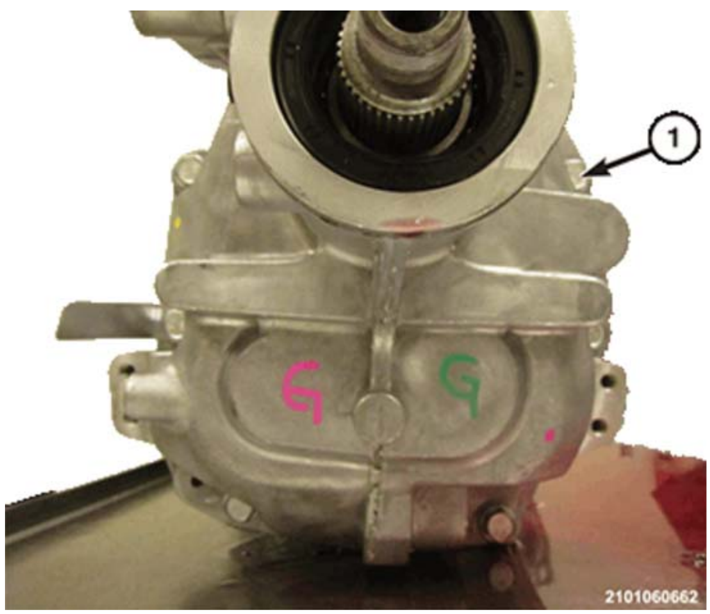

Fig. 210: Extension Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

48. Install the extension housing bolts (1) and tighten to the proper **SPECIFICATIONS** .

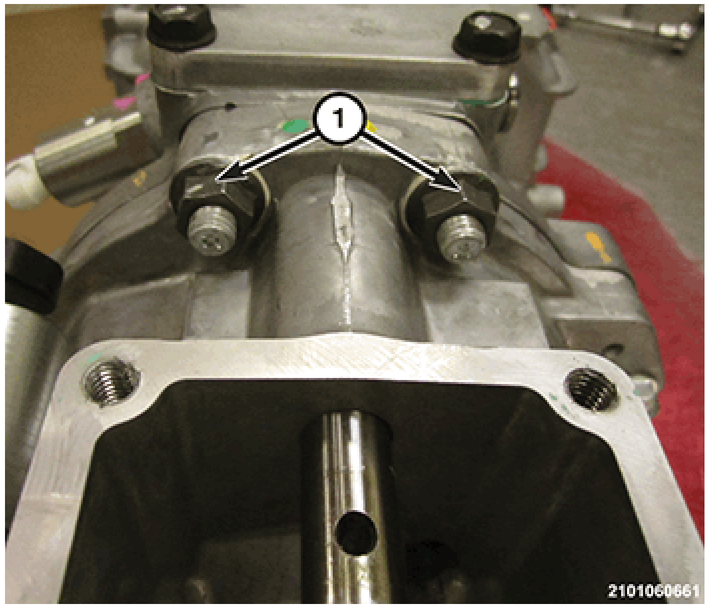

Fig. 211: Extension Housing Nuts
Courtesy of CHRYSLER GROUP, LLC

49. Install the extension housing nuts (1) and tighten to the proper **SPECIFICATIONS** .

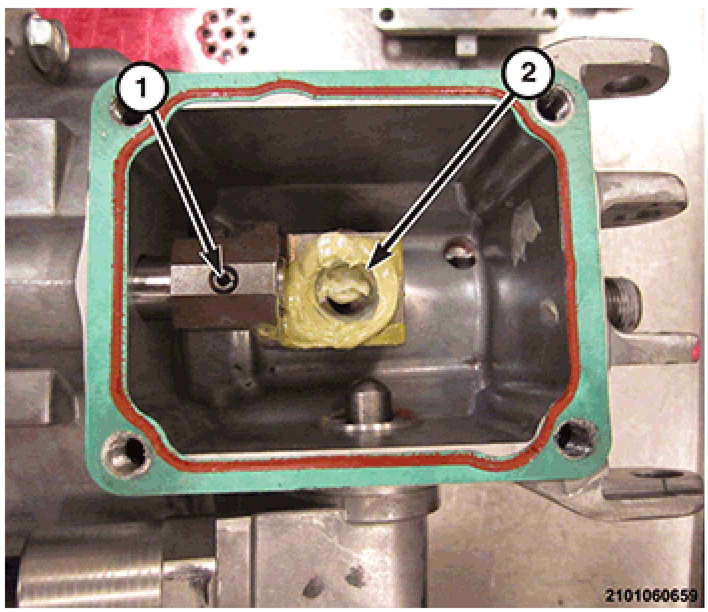

Fig. 212: Offset Lever & Roll Pin
Courtesy of CHRYSLER GROUP, LLC

50. Install the offset lever (2) and the offset lever roll pin (1) with a hammer and punch.

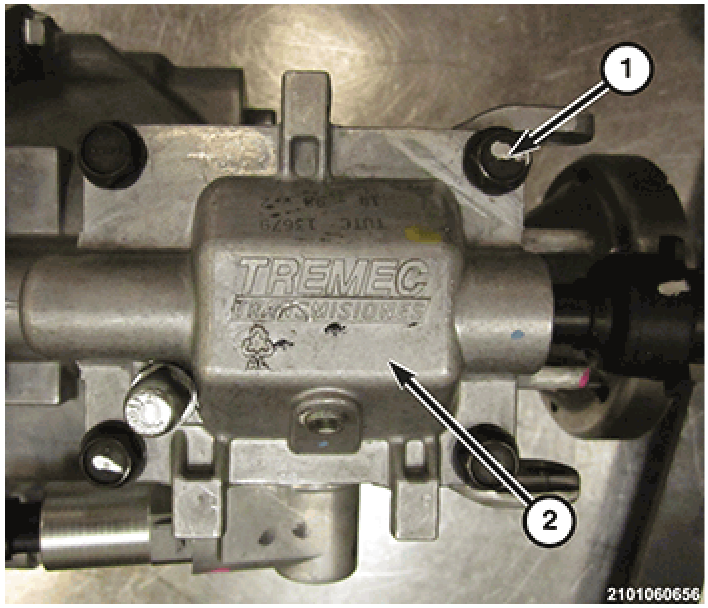

Fig. 213: Shift Cover & Bolts
Courtesy of CHRYSLER GROUP, LLC

51. For transmissions equipped with RTV use, Mopar Ā® ATF-RTV to the shift cover sealing surface.

    For transmissions equipped with a gasket, install a **NEW** gasket.

52. Install shift cover (2) bolts (1) and tighten to the proper **SPECIFICATIONS** .

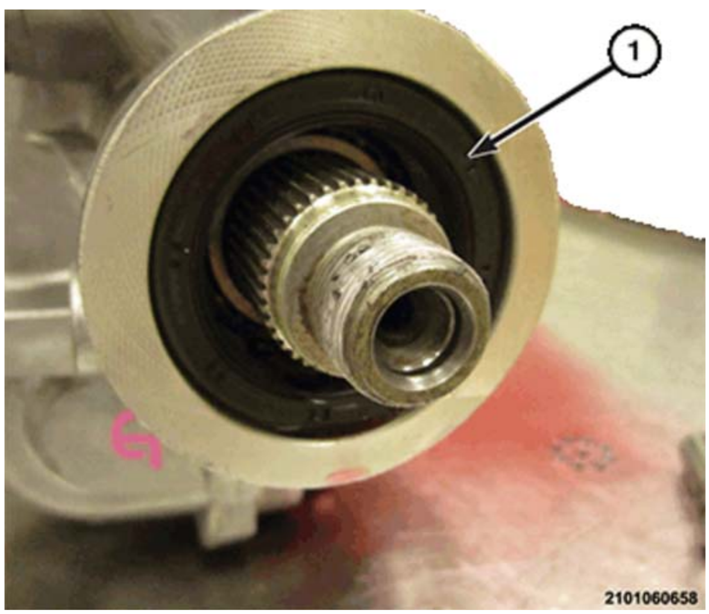

Fig. 214: Extension Housing Seal
Courtesy of CHRYSLER GROUP, LLC

53. Install the extension housing seal (1) in the extension housing with installer (special tool #7884, Installer, Seal) (2).

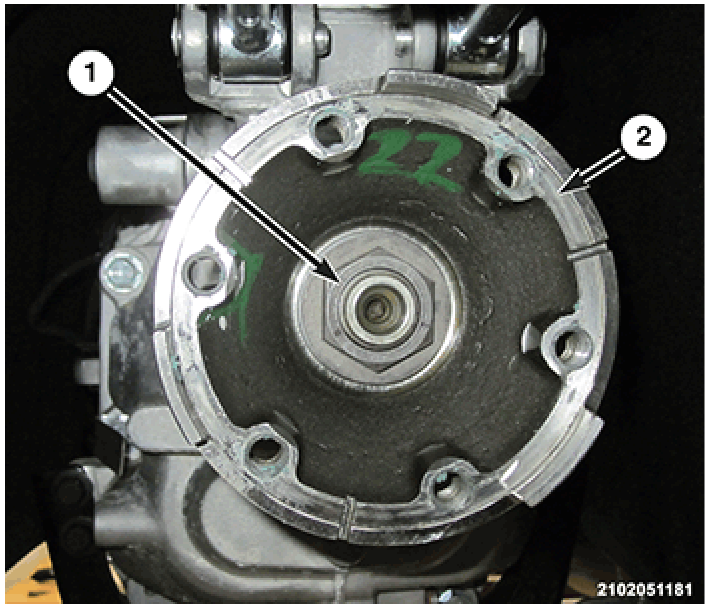

Fig. 215: Output Flange & Locknut
Courtesy of CHRYSLER GROUP, LLC

54. Install the output flange (2) to the transmission output shaft.
55. Hold the output flange (2) with Special Tool (special tool #C-3281, Holder, Flange) (2) Flange Wrench and tighten the output flange locknut (1) to the proper **SPECIFICATIONS** .

INSTALLATION

INSTALLATION

1. Position the transmission into the clutch and seat against the bell housing.

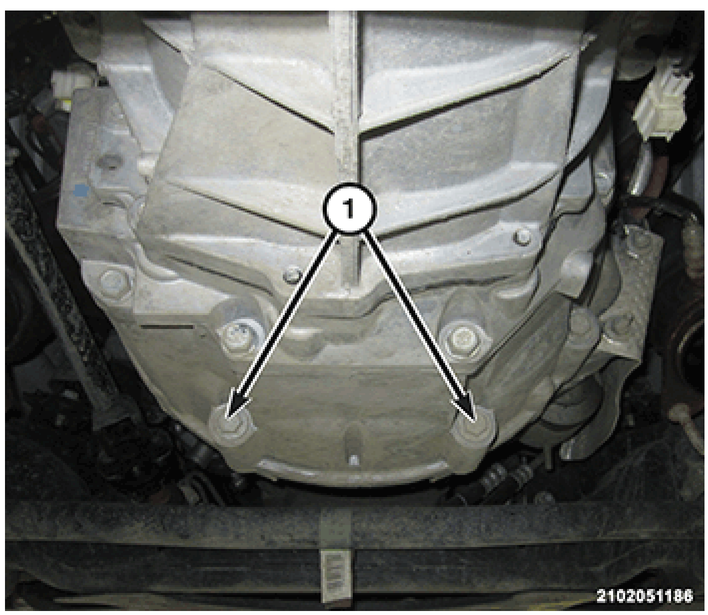

Fig. 216: Bottom Transmission To Oil Pan Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Install the bottom transmission to oil pan bolts (1) and tighten to the proper **SPECIFICATIONS** .

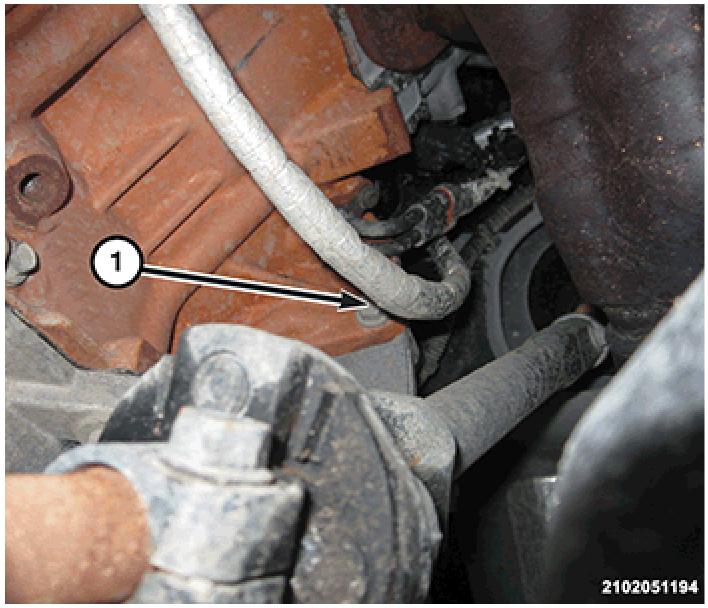

Fig. 217: Front Transmission To Engine Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Install the front transmission to engine bolt (1) and tighten to the proper **SPECIFICATIONS** .

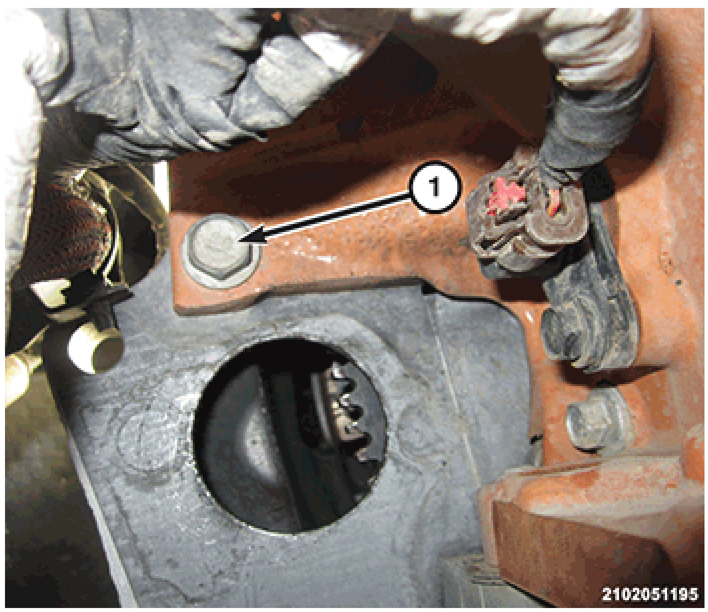

Fig. 218: Front Transmission To Engine Bolt
Courtesy of CHRYSLER GROUP, LLC

4. Install the front transmission to engine bolt and tighten to the proper **SPECIFICATIONS** .

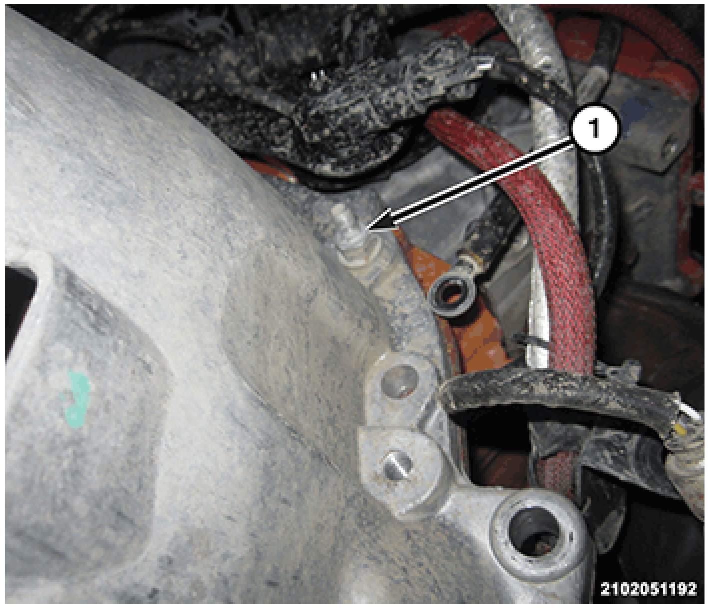

Fig. 219: Engine Stud Bolt
Courtesy of CHRYSLER GROUP, LLC

5. Install the transmission to engine stud (1) and tighten to the proper **SPECIFICATIONS** .

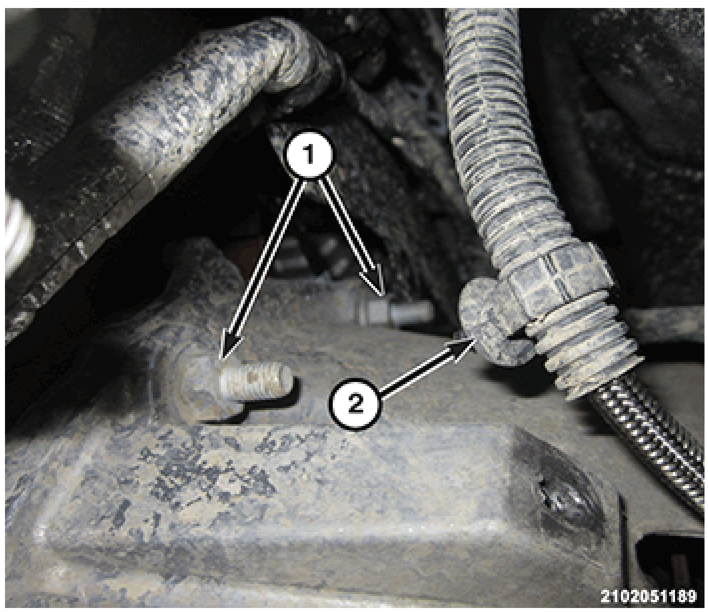

Fig. 220: Engine Stud Bolts & Harness Clip
Courtesy of CHRYSLER GROUP, LLC

6. Install the three (two shown) transmission to engine studs (1) and tighten to the proper **SPECIFICATIONS** .

Fig. 221: Rainbow Bracket Nut
Courtesy of CHRYSLER GROUP, LLC

7. Install the rainbow bracket nut (1) and tighten to the proper SPECIFICATIONS .

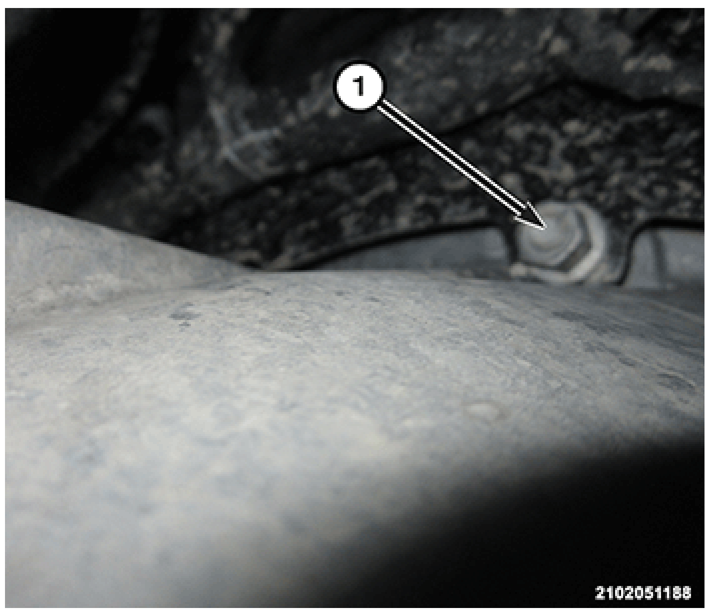

Fig. 222: Rainbow Bracket Nut
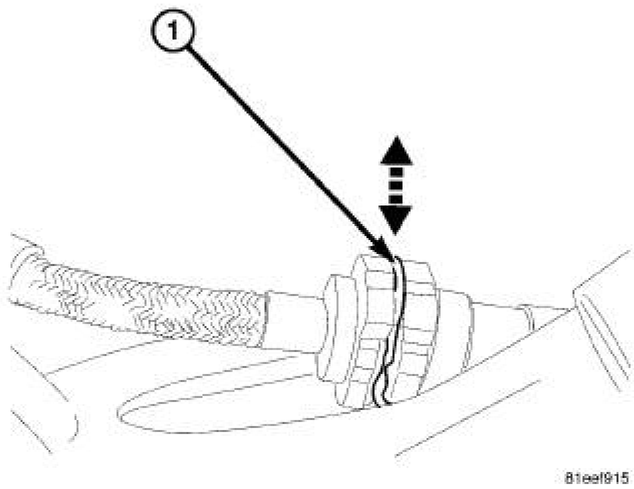
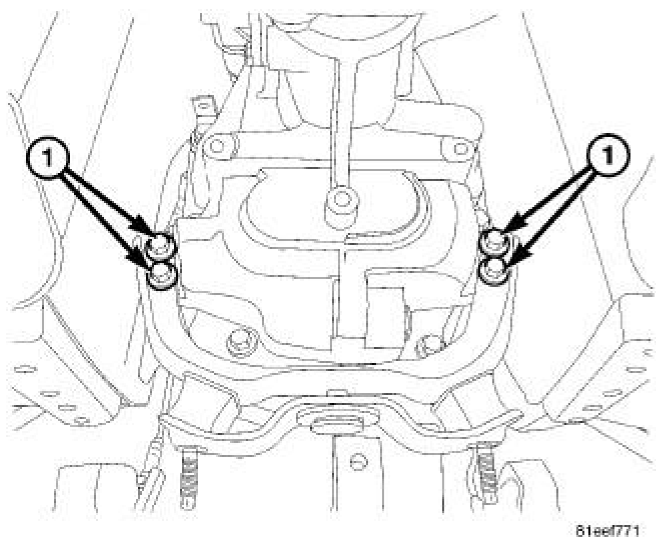
Courtesy of CHRYSLER GROUP, LLC

8. Install the rainbow bracket nut (1) and tighten to the proper SPECIFICATIONS .



[Fig. 223: Clutch Hose Removal](#)
Courtesy of CHRYSLER GROUP, LLC

9. Push the clip (1) securing the clutch hydraulic hose to the throw out bearing assembly. Verify the clutch hydraulic hose is installed.



[Fig. 224: Transmission Isolator Bracket Upper Bolts](#)
Courtesy of CHRYSLER GROUP, LLC

10. Install the crossmember, isolator bracket and isolator on the transmission.
11. Install the isolator bracket bolts (1) and tighten to the proper **SPECIFICATIONS** .

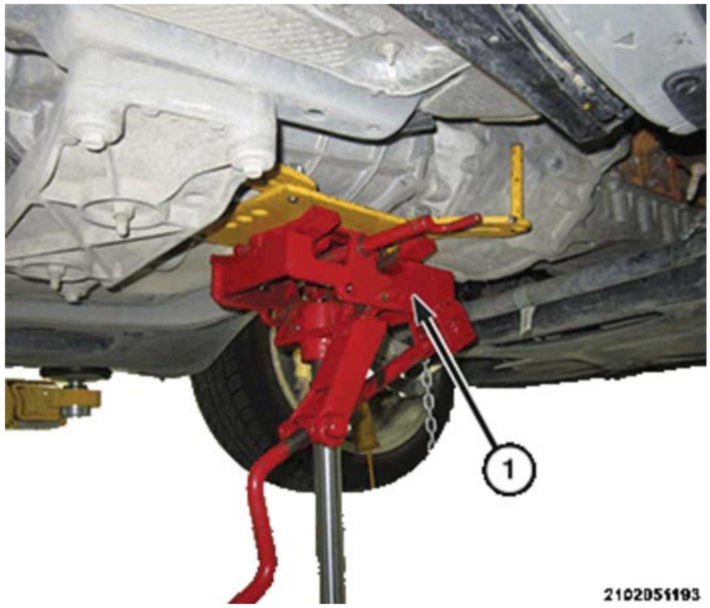


Fig. 225: Transmission Jack
Courtesy of CHRYSLER GROUP, LLC

12. Raise the transmission slightly with the transmission jack (1) to allow the crossmember to sit flush with the body.

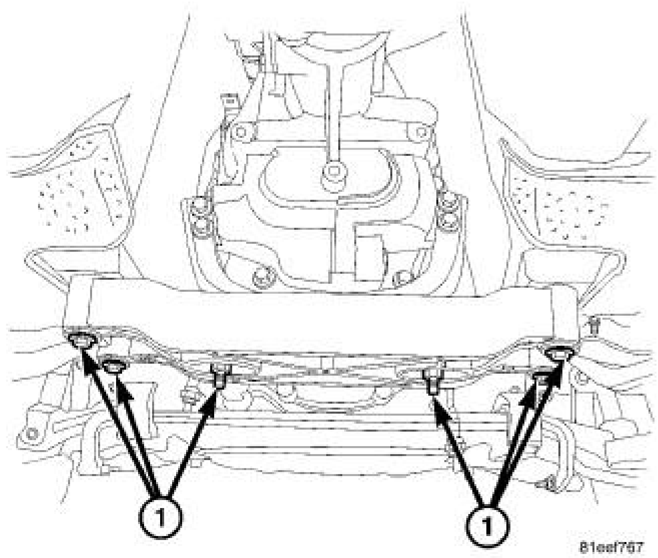

Fig. 226: Crossmember And Isolator
Courtesy of CHRYSLER GROUP, LLC

13. Install the crossmember bolts (1) and tighten to the proper **SPECIFICATIONS** .

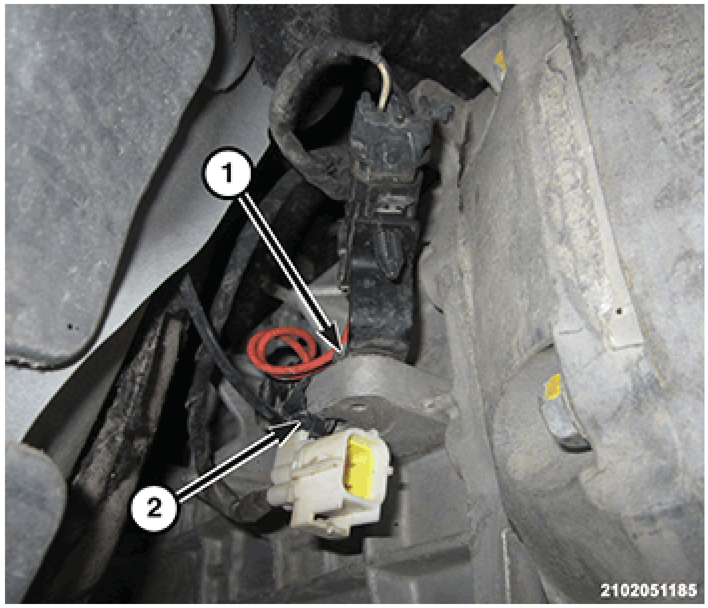

Fig. 227: Push Pin Wiring Connectors & Harness Clips
Courtesy of CHRYSLER GROUP, LLC

14. Install the push pin wiring connectors (1 and 2) on the transmission.

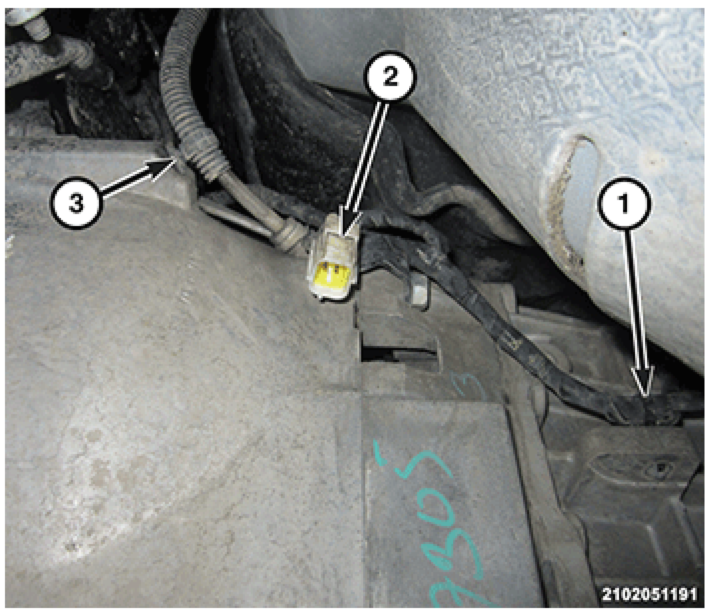

Fig. 228: Wire Harness Connector & Harness Clips
Courtesy of CHRYSLER GROUP, LLC

15. Install push pin wiring connectors (1 and 2) and the clutch hydraulic tube push pin (3) on the transmission.

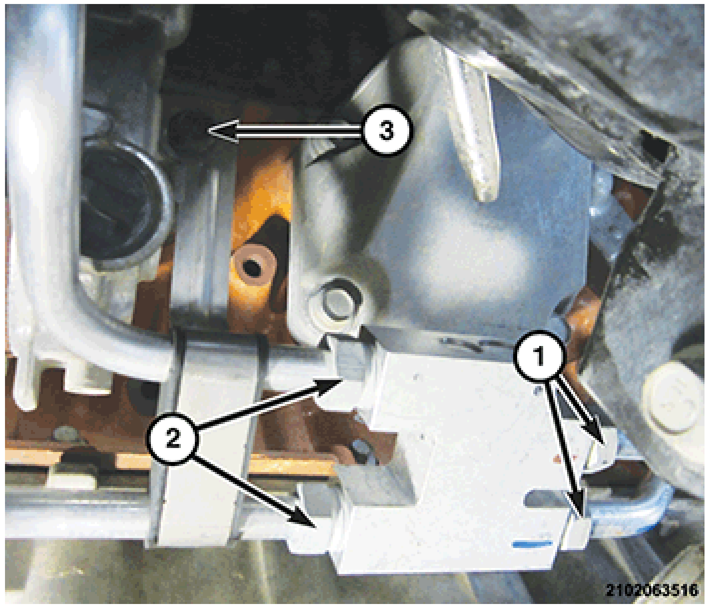

Fig. 229: Transmission Cooler Lines & Bracket Bolt
Courtesy of CHRYSLER GROUP, LLC

16. Connect the rear transmission cooler lines (1) to the thermal bypass valve.

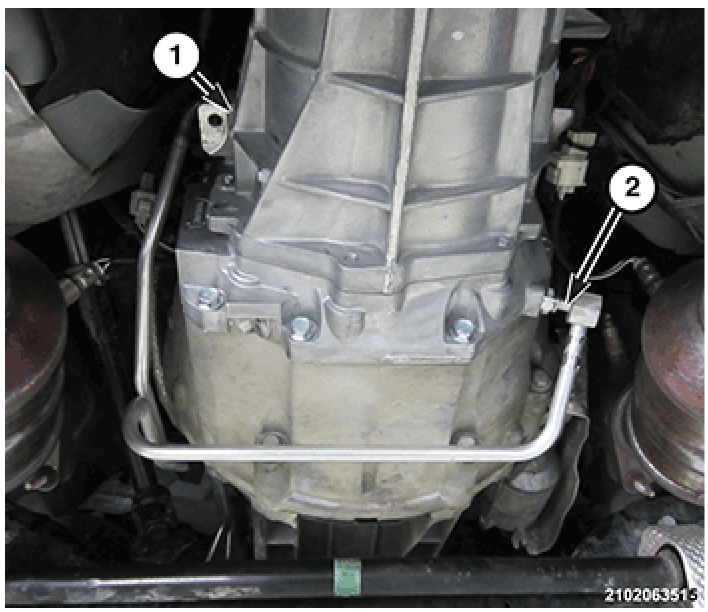

Fig. 230: Transmission Cooler Lines
Courtesy of CHRYSLER GROUP, LLC

17. Connect the transmission cooler lines (1 and 2) to the transmission.

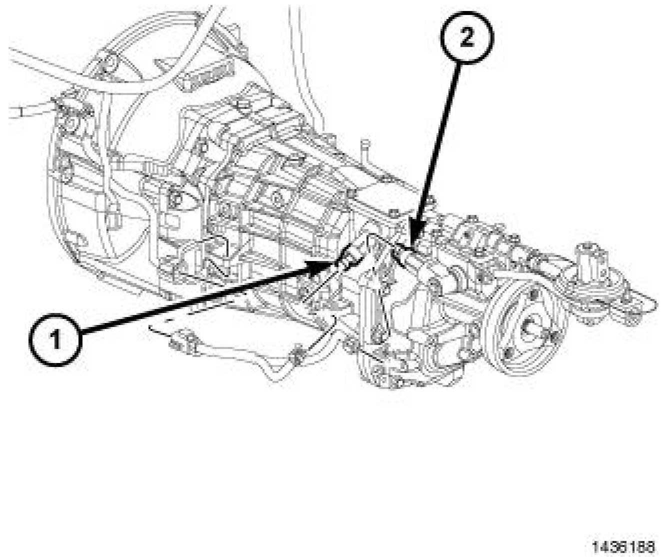

Fig. 231: Skip Shift & Reverse Lockout Solenoids
Courtesy of CHRYSLER GROUP, LLC

18. Connect the transmission skip shift solenoid wire harness connector (1) and the transmission reverse lockout solenoid wire harness connector (2).

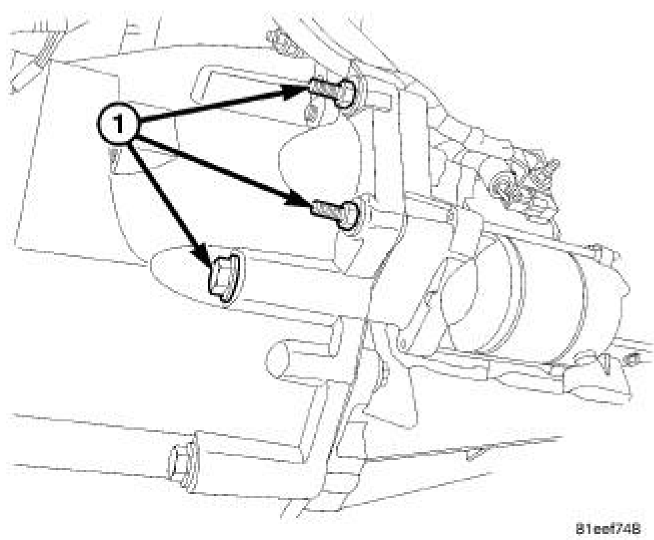

Fig. 232: Starter Bolts
Courtesy of CHRYSLER GROUP, LLC

19. Position the starter in place, install the starter bolts (1) and tighten to the proper **SPECIFICATIONS** .

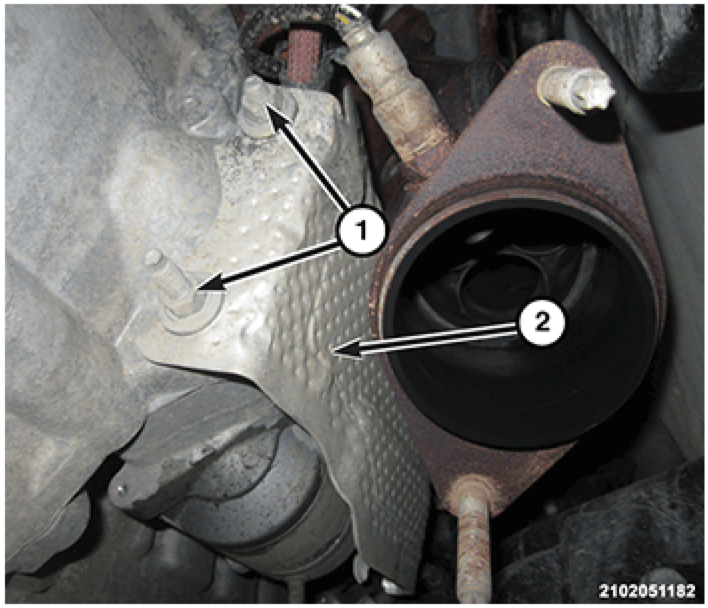

Fig. 233: Starter Heat Shield & Nuts
Courtesy of CHRYSLER GROUP, LLC

20. Install the starter heat shield (2) and the starter heat shield nuts (1) and tighten to the proper **SPECIFICATIONS** .

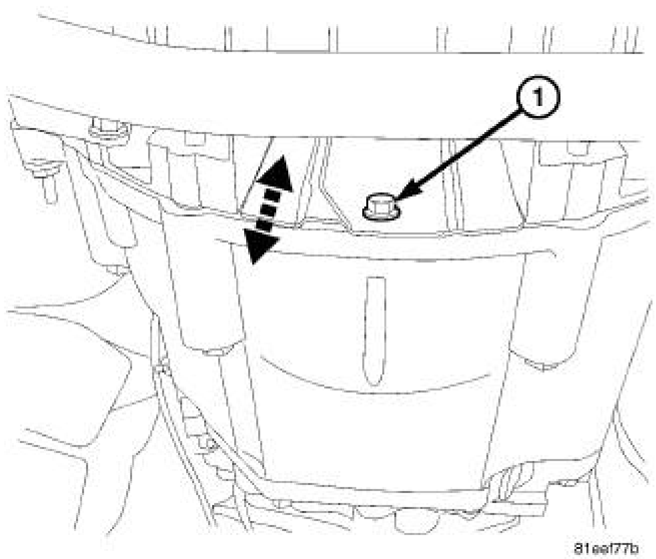

Fig. 234: Inspection Cover
Courtesy of CHRYSLER GROUP, LLC

21. Install the inspection cover, the inspection cover bolt (1) and tighten to the proper **SPECIFICATIONS** .

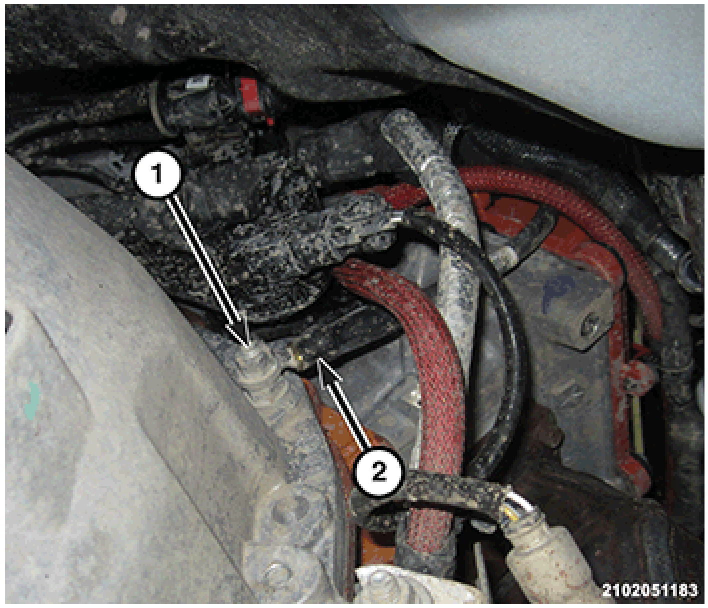

Fig. 235: Shift Linkage Bolt & Retaining Pins
Courtesy of CHRYSLER GROUP, LLC

22. Install the ground wire (2), the ground wire nut (1) and tighten to the proper SPECIFICATIONS .

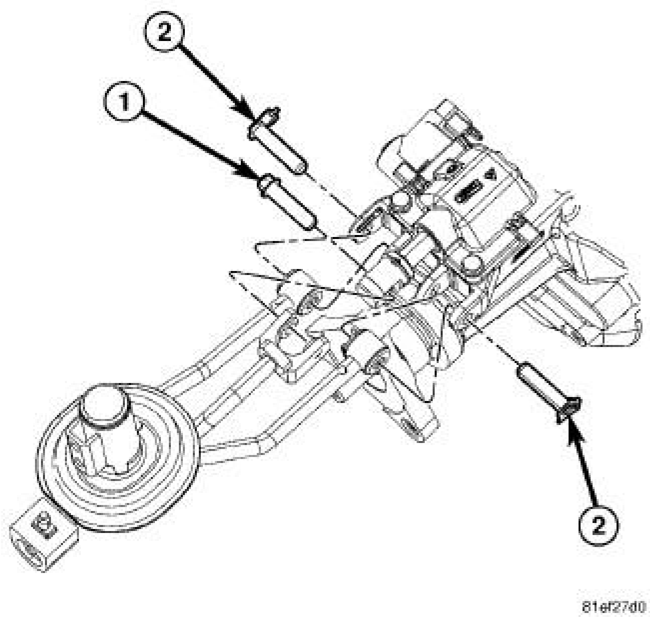

Fig. 236: Shift Linkage Bolt & Retaining Pins
Courtesy of CHRYSLER GROUP, LLC

23. If necessary install the shift linkage bolt (1) and the roll pins (2) and the shift linkage onto the transmission. Tighten the shift linkage bolt to the proper SPECIFICATIONS .
24. Install the drive shaft. Refer to INSTALLATION .
25. Install the exhaust. Refer to CONVERTER, CATALYTIC, INSTALLATION .
26. Lower the vehicle.

27. Connect the negative battery cable.
28. Road test the vehicle to verify proper operation.

SPECIAL TOOLS

SPECIAL TOOLS

	10026 - Puller, Synchro Hub (Originally Shipped In Kit Number(s) 10017, 10017A.)
	10027 - Button, Press (Originally Shipped In Kit Number(s) 10017, 10017A.)

	10028 - Installer, Bearing (Originally Shipped In Kit Number(s) 10017, 10017A.)
	1130 - Splitter, Bearing/Gear (Originally Shipped In Kit Number(s) 6745, 6947, 6949, 9202, 9202A-CAN, 9202CC, 9299.)
	6786 - Remover, Bushing (Originally Shipped In Kit Number(s) 6784, 6809, 6822.)

	7794-A - Remover, Seal (Originally Shipped In Kit Number(s) 6645.)
	7884 - Installer, Seal (Originally Shipped In Kit Number(s) 9975.)
	8161 - Adapter Rod (Originally Shipped In Kit Number(s) 8163, 8163CC, 8164, 8164CC.)

	8475 - Installer, Bushing (Originally Shipped In Kit Number(s) 8708, 8708CC.)
	9366 - Installer, Seal (Originally Shipped In Kit Number(s) 10017, 10017A.)

	9369 - Remover, Bearing Cup (Originally Shipped In Kit Number(s) 10017, 10017A.)
	9373 - Installer, Bearing Cup (Originally Shipped In Kit Number(s) 10017, 10017A.)

	9377 - Press Adapter (Originally Shipped In Kit Number(s) 10017, 10017A.)

INPUT SHAFT, TRANSMISSION

REMOVAL

REMOVAL

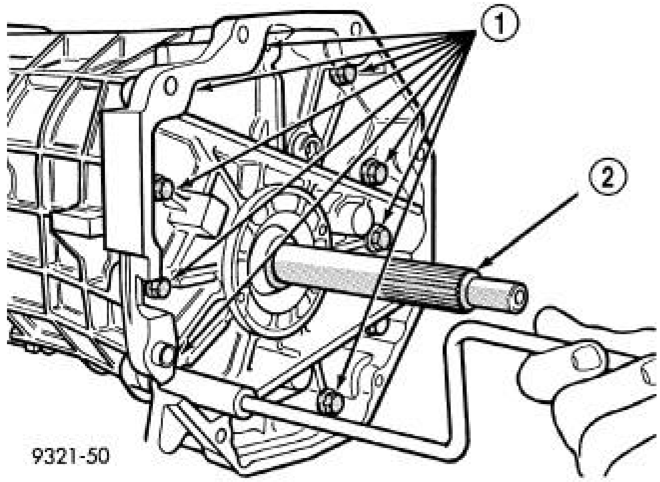

Fig. 237: Front Adapter Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: **If input shaft is damaged behind the seal, the transmission must be disassembled and inspected.**

1. Measure output shaft end play and record number.
2. Remove clutch slave cylinder from transmission adapter plate.
3. Remove front adapter plate bolts (1).

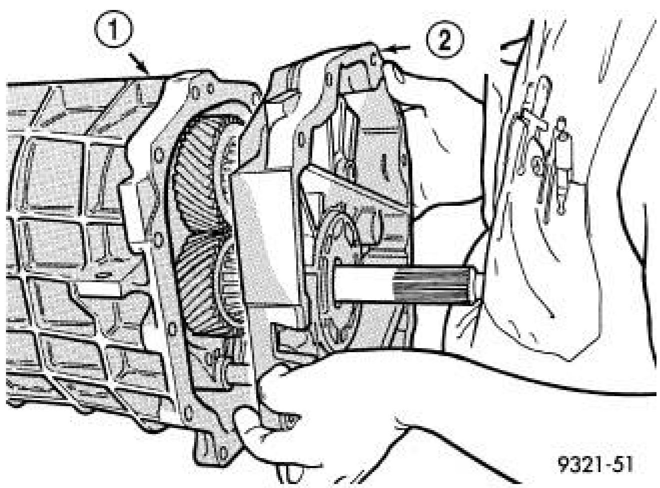

Fig. 238: Slide Off Adapter
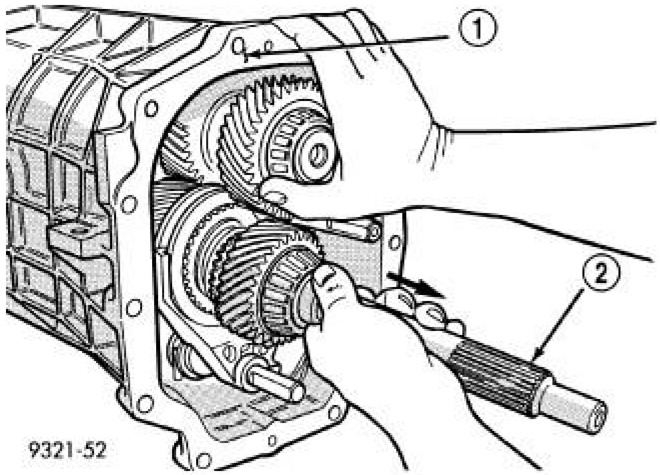
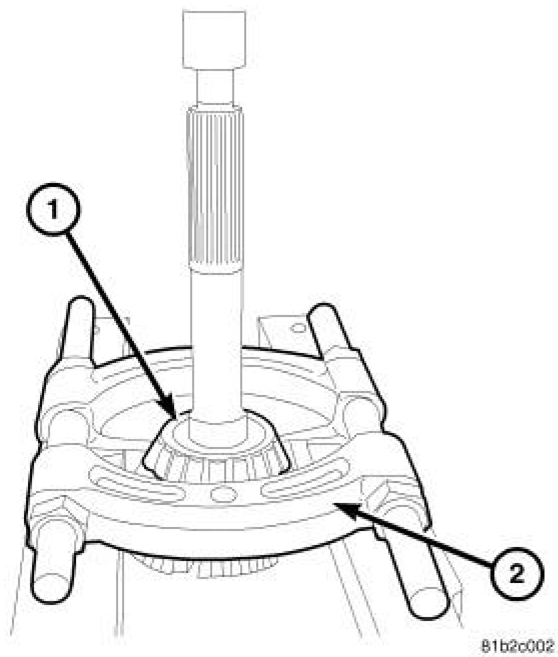
Courtesy of CHRYSLER GROUP, LLC

4. Pry front cover adapter loose.
5. Hold input shaft while removing adapter (2).
6. Remove input shaft seal from adapter with a seal puller.
7. Clean and inspect all sealing surfaces for wear or damage.



[Fig. 239: Remove Input Shaft](#)
Courtesy of CHRYSLER GROUP, LLC

8. Lift countershaft slightly and remove input shaft (2) from transmission (1).



[Fig. 240: Input Shaft Bearing](#)
Courtesy of CHRYSLER GROUP, LLC

9. Remove input shaft bearing (1) with Splitter (special tool #1130, Splitter, Bearing/Gear) (2) and a press.

INSTALLATION

INSTALLATION

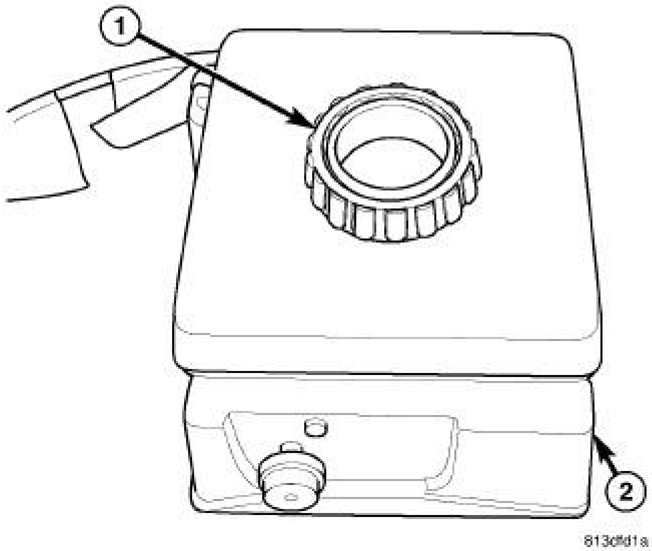


Fig. 241: Identifying Bearing Heater And Bearing
Courtesy of CHRYSLER GROUP, LLC

WARNING: Use tongs or welding gloves when handling heated components. Failure to follow these instructions will result in personal injury.

CAUTION: Bearings (1) are installed using a Bearing Heater (2). Use only a bearing heater/hot plate and follow manufacture's instructions. Heat components to 100 - 149 Celsius (212Â° Min. - 300Â° Max Fahrenheit). Never use an open flame to heat components. Never leave components on heater for an extended amount of time. If component is discolored after heating, the component has been overheated and must not be used. Failure to follow these instructions will result in component damage.

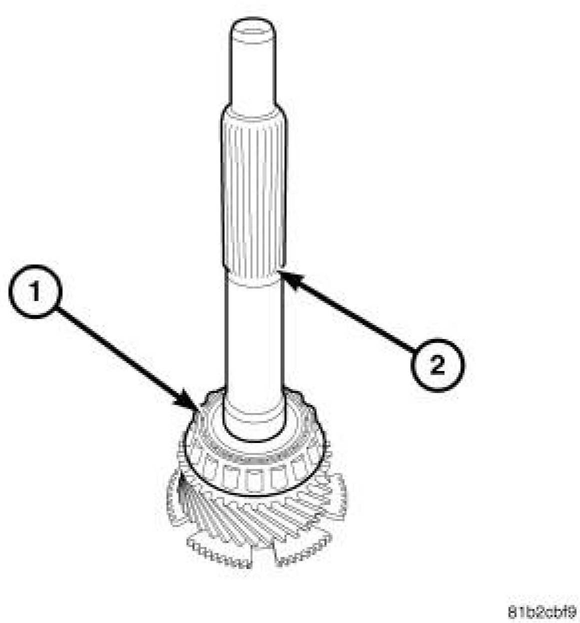

Fig. 242: Input Shaft Bearing

Courtesy of CHRYSLER GROUP, LLC

1. Heat input shaft bearing to 100 - 149 Celsius (212Â° Min. - 300Â° Max Fahrenheit). Install bearing (1) on input shaft (2) with tongs or welding gloves.
2. Install new bearing cup in front adapter with original shim behind cup.
3. Clean sealing surfaces of the transmission case and adapter plate.
4. Install input shaft and adapter plate.
5. Check output shaft end play and adjust shim to achieve the original reading.

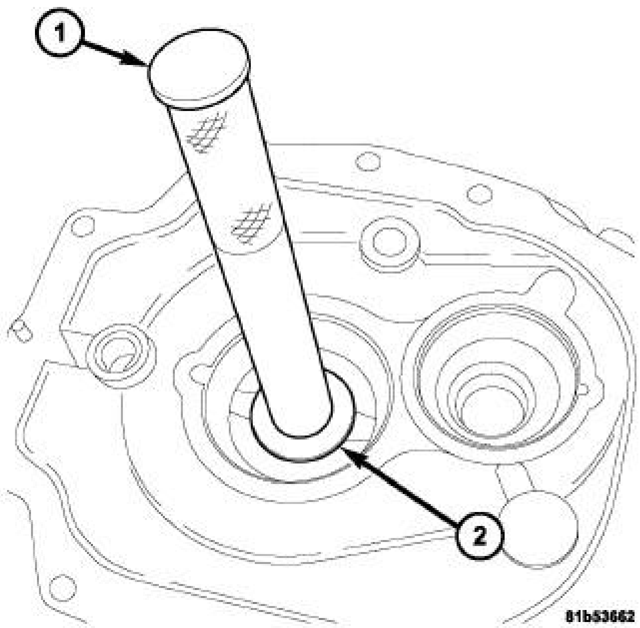

Fig. 243: Input Shaft Seal
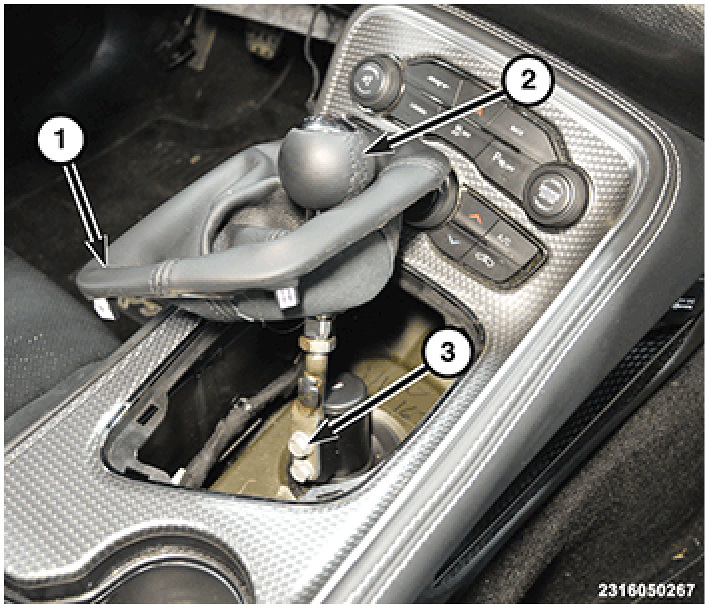
Courtesy of CHRYSLER GROUP, LLC

6. Remove adapter plate and install a new input shaft seal with Handle (special tool #C-4171, Driver Handle, Universal) and Installer (special tool #9366, Installer, Seal).
7. Apply Mopar Â® ATF-RTV to the cleaned sealing surfaces.
8. Install adapter and tighten bolts to 34 N.m (25 ft. lbs.).

LEVER, SHIFT

REMOVAL

SHIFT LEVER

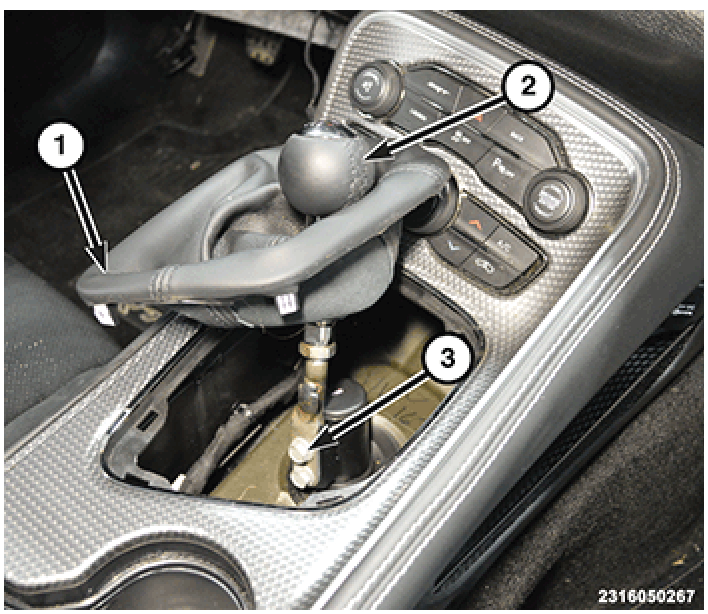


[Fig. 244: Shifter Boot, Shift Lever & Bolts]
Courtesy of CHRYSLER GROUP, LLC

1. Using a trim stick (special tool #C-4755, Trim Stick) or equivalent, separate the shift lever boot (1) from the floor console.
2. Remove the shift lever bolts (3) and the shift lever (2).

INSTALLATION

SHIFT LEVER



[Fig. 245: Shifter Boot, Shift Lever & Bolts]
Courtesy of CHRYSLER GROUP, LLC

1. Install the shift lever (2) and the shift lever bolts (3) on the shifter assembly and tighten to the proper **SPECIFICATIONS** .
2. Install the shift lever boot (1).

MECHANISM, GEARSHIFT

REMOVAL

GEARSHIFT MECHANISM

1. Disconnect and isolate the negative battery cable.
2. Place transmission shifter in neutral.

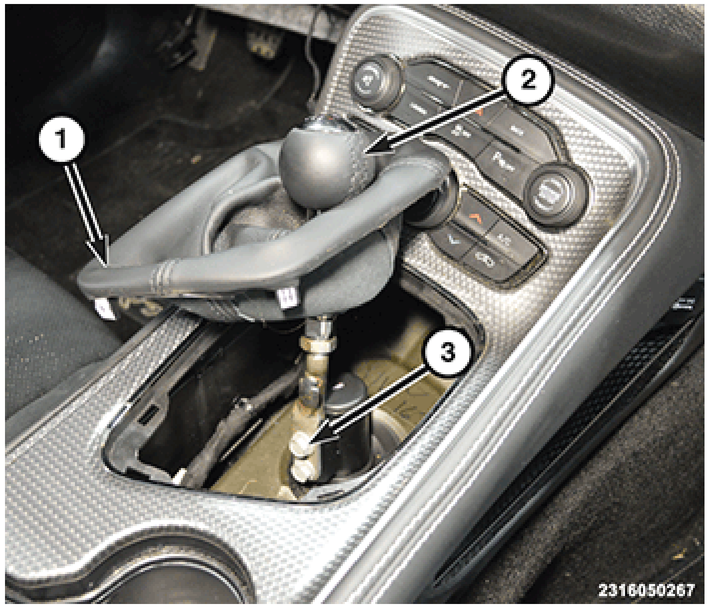


Fig. 246: Shifter Boot, Shift Lever & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Using a trim stick (special tool #C-4755, Trim Stick) or equivalent, separate the shift lever boot (1) from the floor console.
4. Remove the shift lever bolts (3) and the shift lever (2).

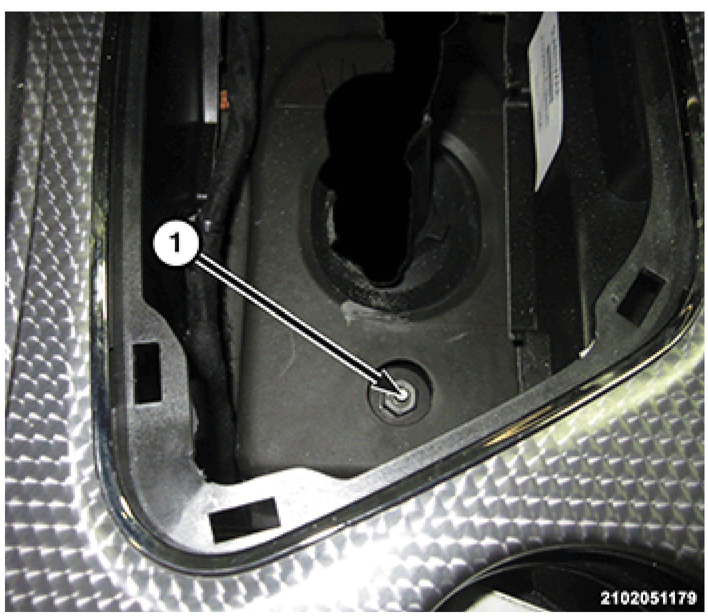

Fig. 247: Shift Linkage To Closure Panel Nut

Courtesy of CHRYSLER GROUP, LLC

5. Remove the nut (1) holding the shift linkage to the closure panel.
6. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
7. Remove the exhaust system. Refer to **MUFFLER, EXHAUST, REMOVAL** .
8. Remove the drive shaft. Refer to **REMOVAL** .

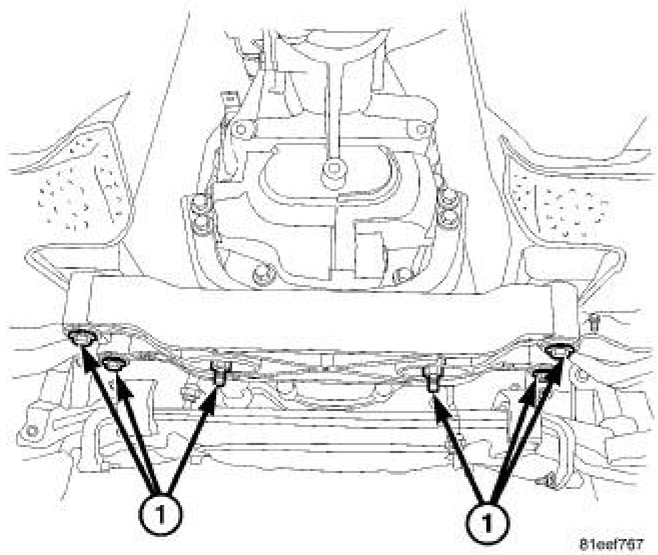

Fig. 248: Crossmember And Isolator
Courtesy of CHRYSLER GROUP, LLC

9. Raise transmission slightly with suitable jack or high stand to relieve load on crossmember mount.
10. Remove the crossmember bolts (1) and remove the crossmember.
11. Lower the transmission enough to gain access to the shift linkage.

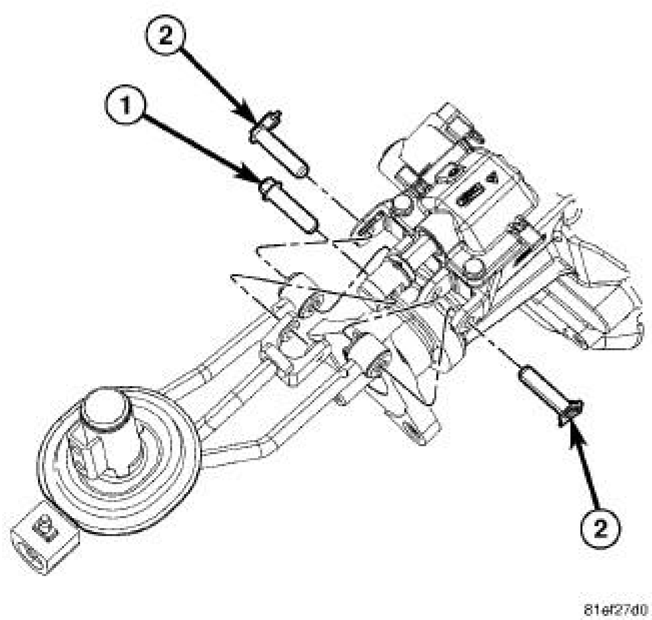

Fig. 249: Shift Linkage Bolt & Retaining Pins
Courtesy of CHRYSLER GROUP, LLC

12. Remove the bolt (1) holding the shift linkage to the transmission shift rail.

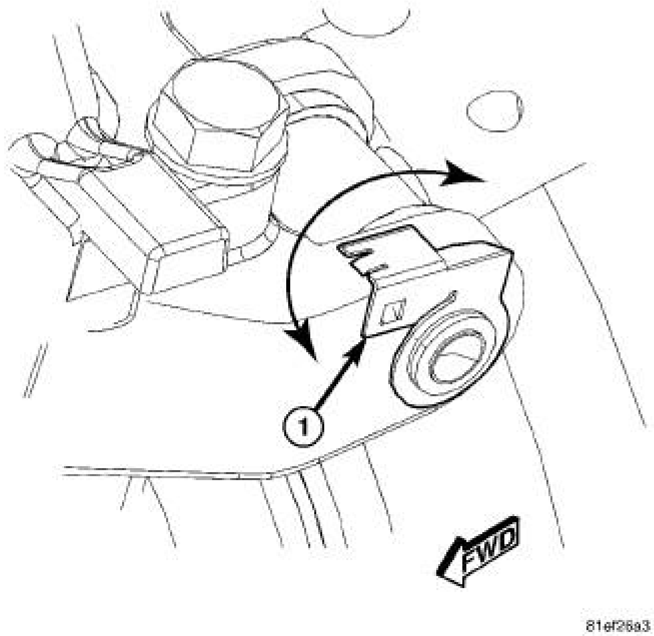

Fig. 250: Shifter Roll Pin Rotation
Courtesy of CHRYSLER GROUP, LLC

13. Rotate each of the locking tabs (1) to disengage them from the roll pins.

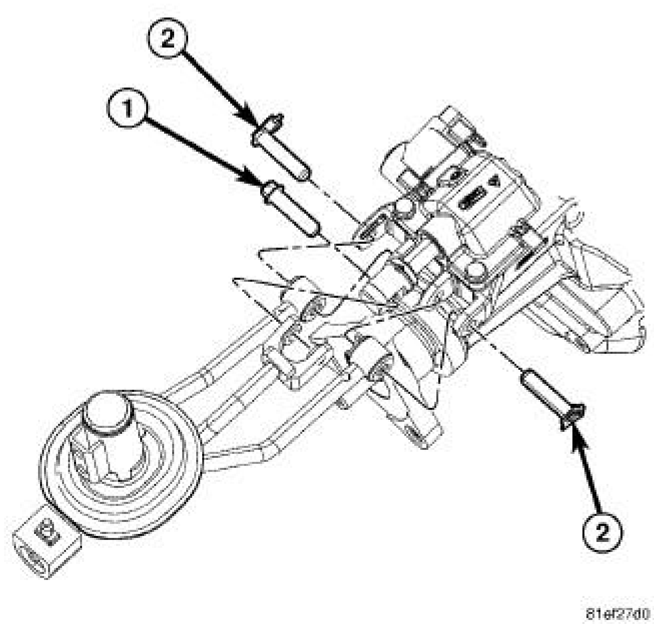

Fig. 251: Shift Linkage Bolt & Retaining Pins
Courtesy of CHRYSLER GROUP, LLC

14. Remove the roll pins (2) holding the shift linkage to the transmission.
15. Remove the shift linkage from the vehicle.

INSTALLATION

GEARSHIFT MECHANISM

1. Place the shift linkage in position on the vehicle.

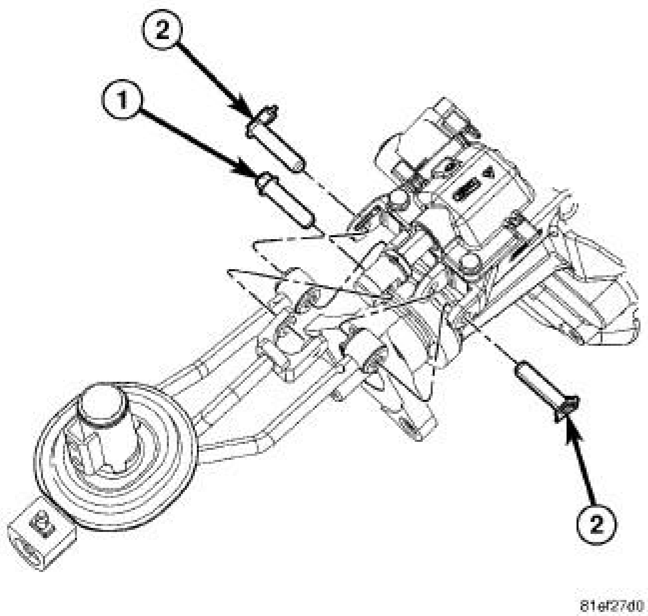

Fig. 252: Shift Linkage Bolt & Retaining Pins
Courtesy of CHRYSLER GROUP, LLC

2. Install the roll pins (2) to hold the shift linkage to the transmission.

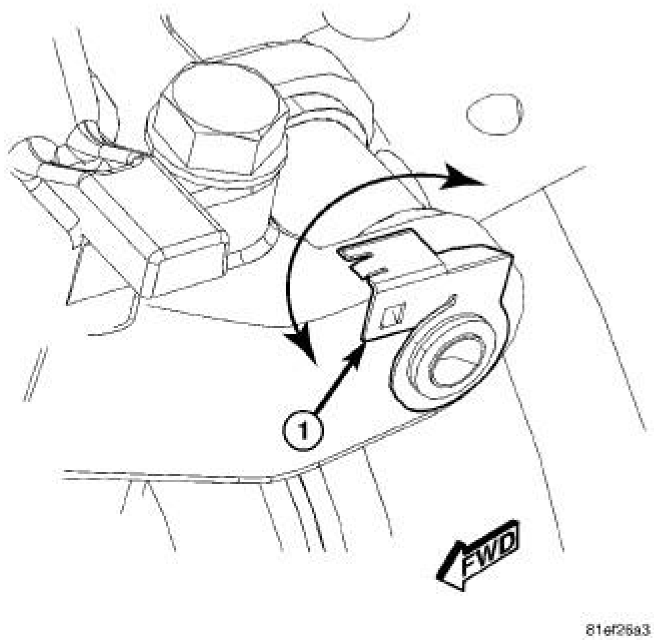

Fig. 253: Shifter Roll Pin Rotation
Courtesy of CHRYSLER GROUP, LLC

3. Install and rotate the locking tabs (1) to engage them onto the roll pins.

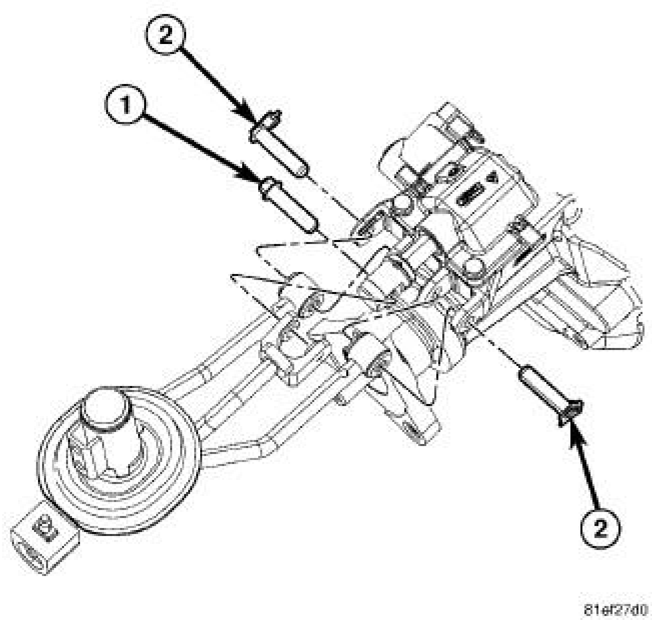

Fig. 254: Shift Linkage Bolt & Retaining Pins
Courtesy of CHRYSLER GROUP, LLC

4. Install the shift linkage bolt (1) and tighten to the proper SPECIFICATIONS .

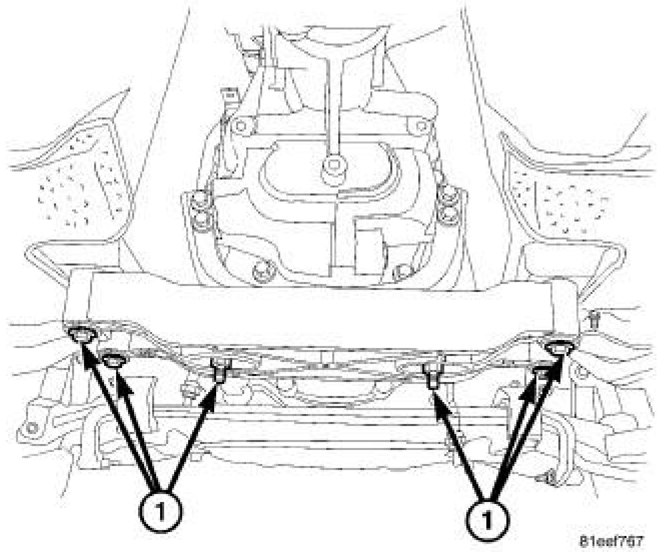

Fig. 255: Crossmember And Isolator
Courtesy of CHRYSLER GROUP, LLC

5. Lift the transmission enough to gain clearance for the crossmember.
6. Place the crossmember in position under the vehicle.
7. Install the crossmember, the crossmember bolts (1) and tighten to the proper **SPECIFICATIONS** .
8. Install the drive shaft. Refer to **INSTALLATION** .
9. Install the exhaust system. Refer to **MUFFLER, EXHAUST, INSTALLATION** .
10. Lower the vehicle.

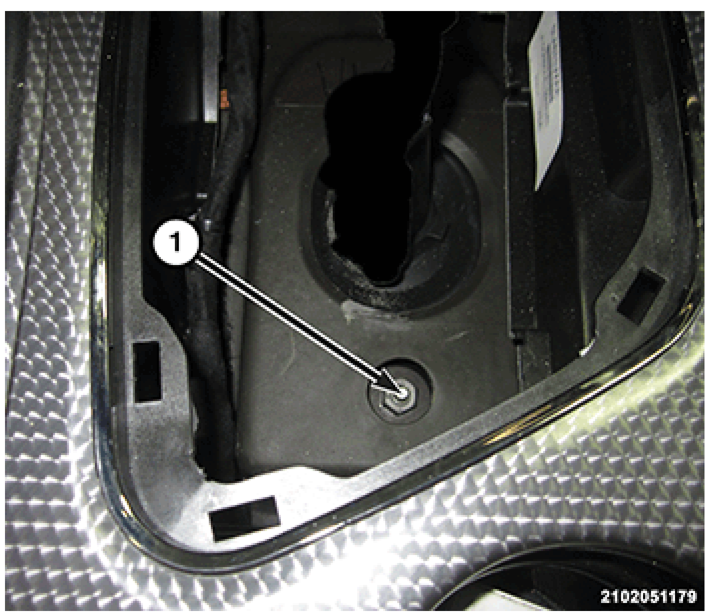

Fig. 256: Shift Linkage To Closure Panel Nut
Courtesy of CHRYSLER GROUP, LLC

11. Install the nut (2) to holding the shift linkage to the closure panel.

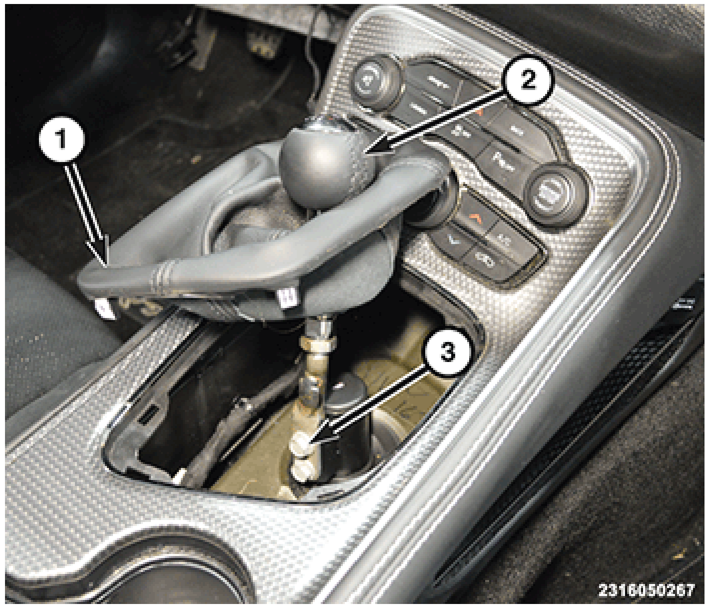

Fig. 257: Shifter Boot, Shift Lever & Bolts
Courtesy of CHRYSLER GROUP, LLC

12. Install the shift lever (2) and the shift lever bolts (3) on the shifter assembly and tighten to the proper **SPECIFICATIONS** .
13. Install the shift lever boot (1).
14. Connect the negative battery cable.
15. Road test the vehicle to verify proper operation.

SEAL, EXTENSION HOUSING

REMOVAL

EXTENSION HOUSING SEAL

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the drive shaft. Refer to **REMOVAL** .

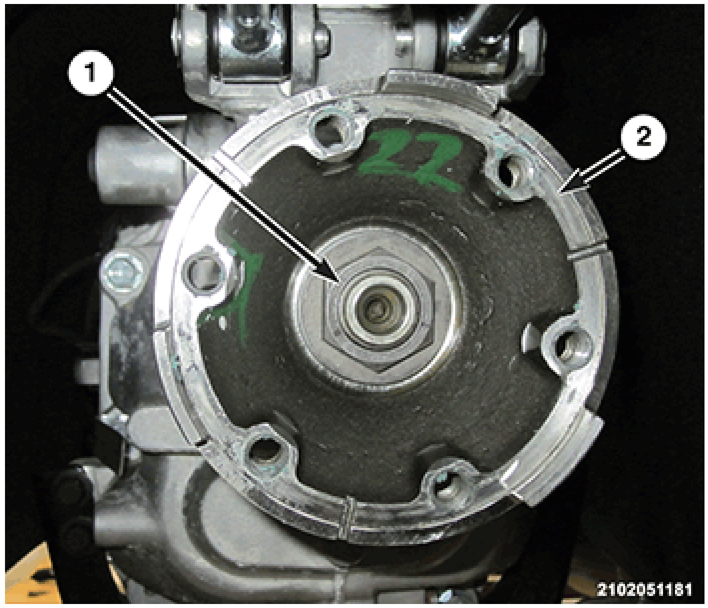

Fig. 258: Output Flange & Locknut
Courtesy of CHRYSLER GROUP, LLC

3. Hold the output flange (2) with Special Tool (special tool #C-3281, Holder, Flange) Flange Wrench while removing the output flange locknut (1).
4. Remove the output flange (2).
5. Remove the extension housing seal.
6. Clean and inspect extension housing seal location.

INSTALLATION

OUTPUT SHAFT SEAL

1. Install extension housing seal into extension housing (1) with Installer (special tool #7884, Installer, Seal) (2).
2. Install the extension housing seal in the extension housing (1) with Installer (special tool #7884, Installer, Seal) (2).

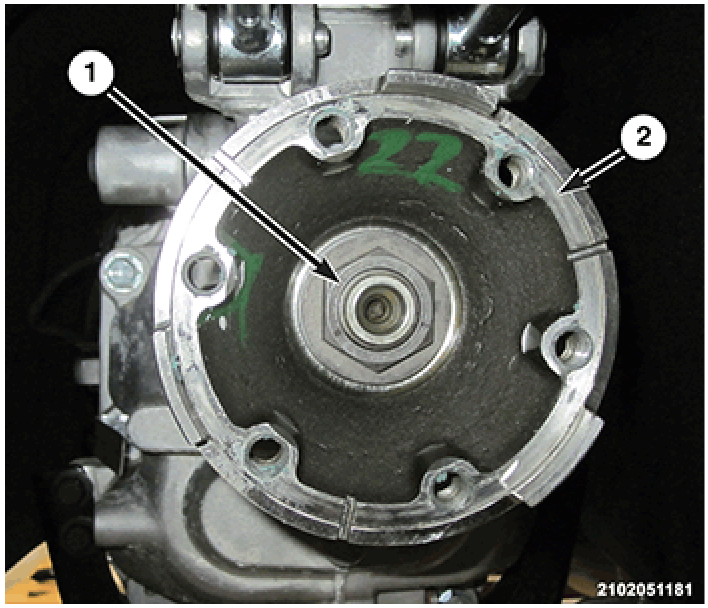

Fig. 259: Output Flange & Locknut
Courtesy of CHRYSLER GROUP, LLC

3. Install the output flange (2) to the transmission output shaft.
4. Hold the output flange (2) with Special Tool (special tool #C-3281, Holder, Flange) (2) Flange Wrench and tighten the output flange locknut (1) to the proper **SPECIFICATIONS** .
5. Install the drive shaft. Refer to **INSTALLATION** .
6. Check transmission fluid level and fill as necessary. Refer to **STANDARD PROCEDURE** .

SOLENOID, TRANSMISSION SKIP SHIFT

DESCRIPTION

DESCRIPTION

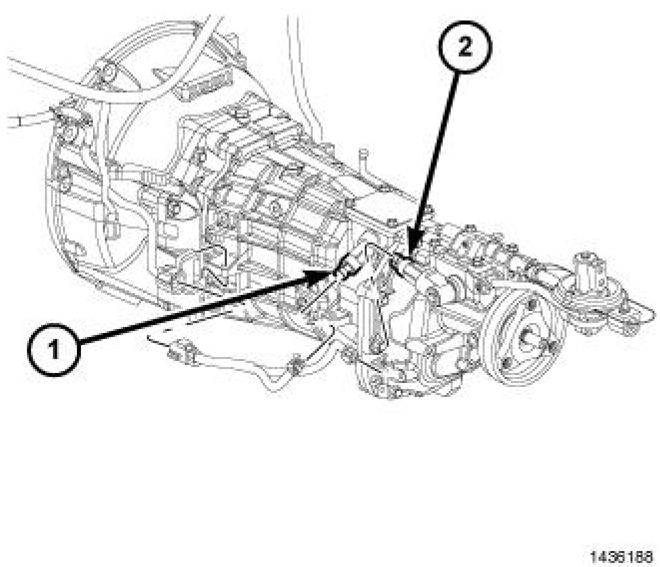

Fig. 260: Skip Shift & Reverse Lockout Solenoids
Courtesy of CHRYSLER GROUP, LLC

The skip shift solenoid (1) prevents the operator from shifting into second or third gear during part throttle operation. The solenoid is threaded into the left side of the transmission case.

OPERATION

OPERATION

The Powertrain Control Module (PCM) controls the skip shift solenoid, locking out second and third gear when all of the following conditions are met:

- Engine coolant exceeds 41Â°C (106Â°F)
- Vehicle speed is between 19 and 20 MPH
- The PCM verified first gear speed/RPM
- Throttle Position Sensor (TPS) signal is less than 0.68 volt above closed throttle (23 percent throttle opening)

The solenoid resets when vehicle speed drops below 3 MPH.

SOLENOID, TRANSMISSION, REVERSE LOCKOUT

DESCRIPTION

DESCRIPTION

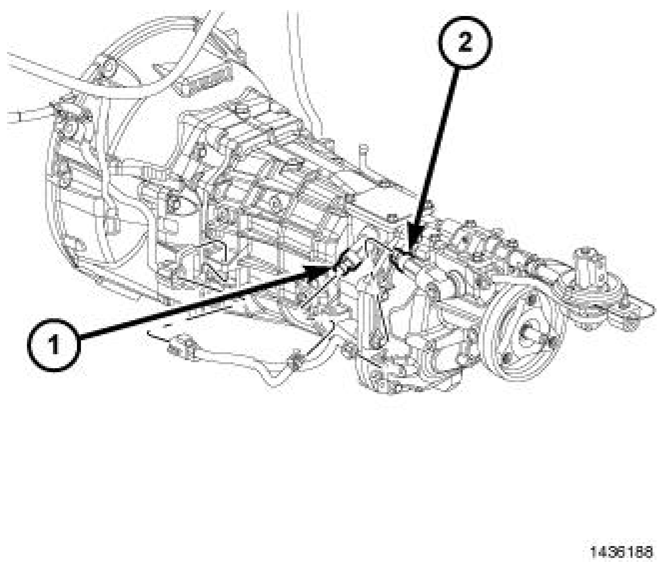

Fig. 261: Skip Shift & Reverse Lockout Solenoids
Courtesy of CHRYSLER GROUP, LLC

The reverse inhibitor solenoid (2) helps the operator to avoid shifting into reverse when the vehicle speed is greater than 3 mph. The solenoid is mounted to the left/rear side of the transmission with a bolt.

OPERATION

OPERATION

If the vehicle speed is less than 3 mph, the PCM sends a ground to energize the solenoid, which provides a low

spring load to the shift knob at the reverse gate and allows shifting the transmission into reverse. If the vehicle speed is greater than 3 mph, the solenoid is deactivated, which provides a high spring load to the shift knob at the reverse gate to help prevent shifting the transmission into reverse.

GENERAL INFORMATION

Trouble Shooting - Basic Procedures

* PLEASE READ THIS FIRST *

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

ACCESSORIES & ELECTRICAL

CHARGING SYSTEM TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

BASIC CHARGING SYSTEM TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Vehicle Will Not Start	
Dead battery	Check battery cells, alternator belt tension and alternator output
Loose or corroded battery connections	Check all charging system connections
Ignition circuit or switch malfunction	Check and replace as necessary
Alternator Light Stays On With Engine Running	
Loose or worn alternator drive belt	Check alternator drive tension and condition, See Belt Adjustment in TUNE-UP article in the TUNE-UP section
Loose alternator wiring connections	Check all charging system connections
Short in alternator light wiring	See Indicator Warning Lights in STANDARD INSTRUMENTS in the ACCESSORIES & EQUIPMENT section
Defective alternator stator or diodes	See Bench Tests in ALTERNATOR article
Defective regulator	See Regulator Check in ALTERNATOR article
Alternator Light Stays Off With Ignition Switch ON	

CONDITION & POSSIBLE CAUSE	CORRECTION
Blown fuse	See WIRING DIAGRAMS
Defective alternator	See Testing in ALTERNATOR article
Defective indicator light bulb or socket	See Indicator Warning Lights in STANDARD INSTRUMENTS in the ACCESSORIES & EQUIPMENT section
Alternator Light Stays OFF With Ignition Switch ON	
Short in alternator wiring	See On-Vehicle Tests in ALTERNATOR article
Defective rectifier bridge	See Bench Tests in ALTERNATOR article
Lights or Fuses Burn Out Frequently	
Defective alternator wiring	See On-Vehicle Tests in ALTERNATOR article
Defective regulator	See Regulator Check in ALTERNATOR article
Defective battery	Check and replace as necessary
Ammeter Gauge Shows Discharge	
Loose or worn drive belt	Check alternator drive belt tension and condition. See Belt Adjustment in TUNE-UP article in the TUNE-UP section
Defective wiring	Check all wires and wire connections
Defective alternator or regulator	See Bench Tests and On-Vehicle Tests in ALTERNATOR article
Defective ammeter, or improper ammeter wiring connection	See Testing in STANDARD INSTRUMENTS in the ACCESSORIES & EQUIPMENT section
Noisy Alternator	
Loose drive pulley	Tighten drive pulley attaching nut
Loose mounting bolts	Tighten all alternator mounting bolts
Worn or dirty bearings	See Bearing Replacement ALTERNATOR article
Defective diodes or stator	See Bench Test in ALTERNATOR article
Battery Does Stay Charged	
Loose or worn drive belt	Check alternator drive belt tension and condition. See Belt Adjustment in appropriate TUNE-UP article in the TUNE-UP section
Loose or corroded battery connections	Check all charging system connections
Loose alternator connections	Check all charging system connections
Defective alternator or battery	See On-Vehicle Tests and Bench Tests in ALTERNATOR article
Add-on electrical accessories exceeding alternator capacity	Install larger alternator
Battery Overcharged-Uses Too Much Water	
Defective battery	Check alternator output and repair as necessary
Defective alternator	See On-Vehicle Test and Bench Tests in ALTERNATOR article
Excessive alternator voltage	Check alternator output and repair as necessary

IGNITION SYSTEM TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

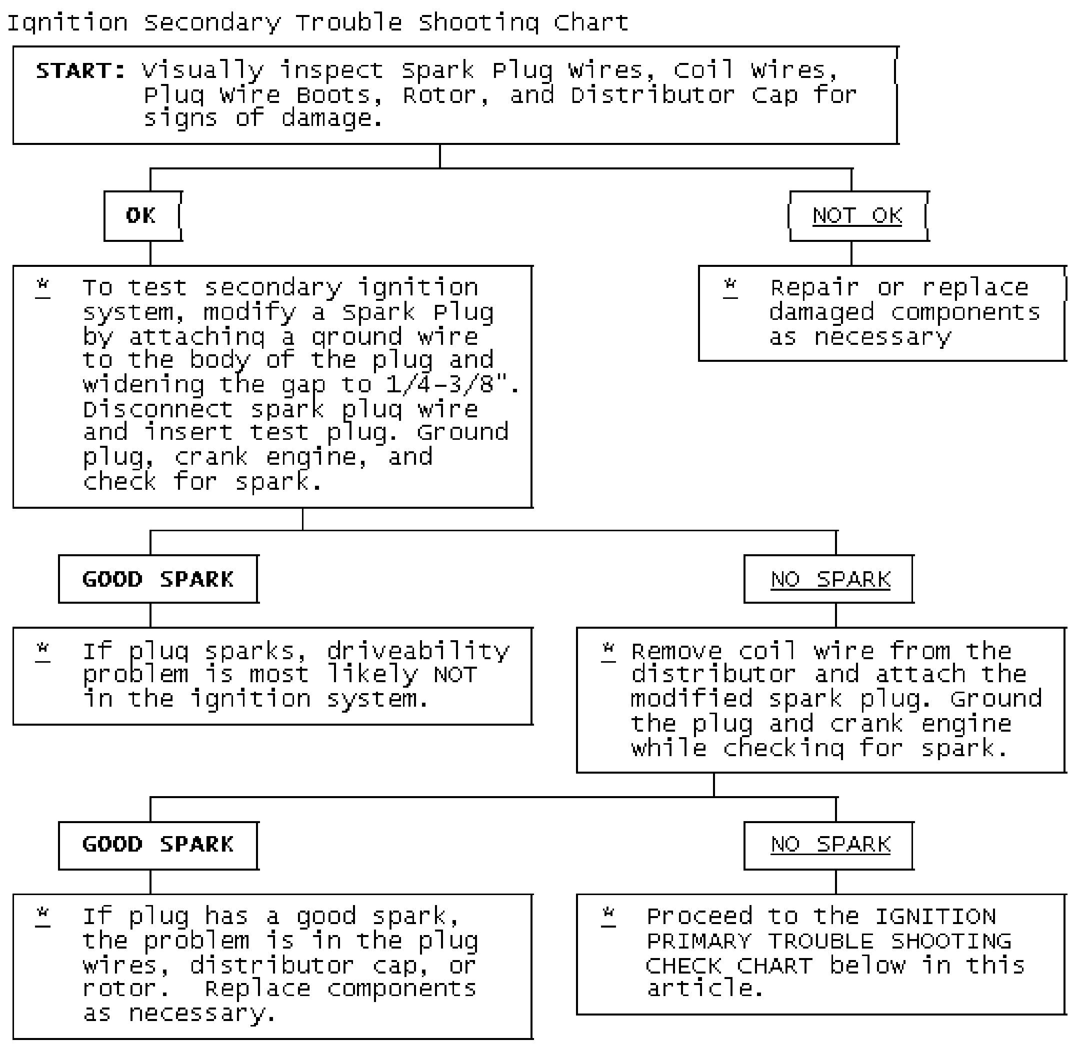

Fig. 1: Ignition Secondary Trouble Shooting Chart

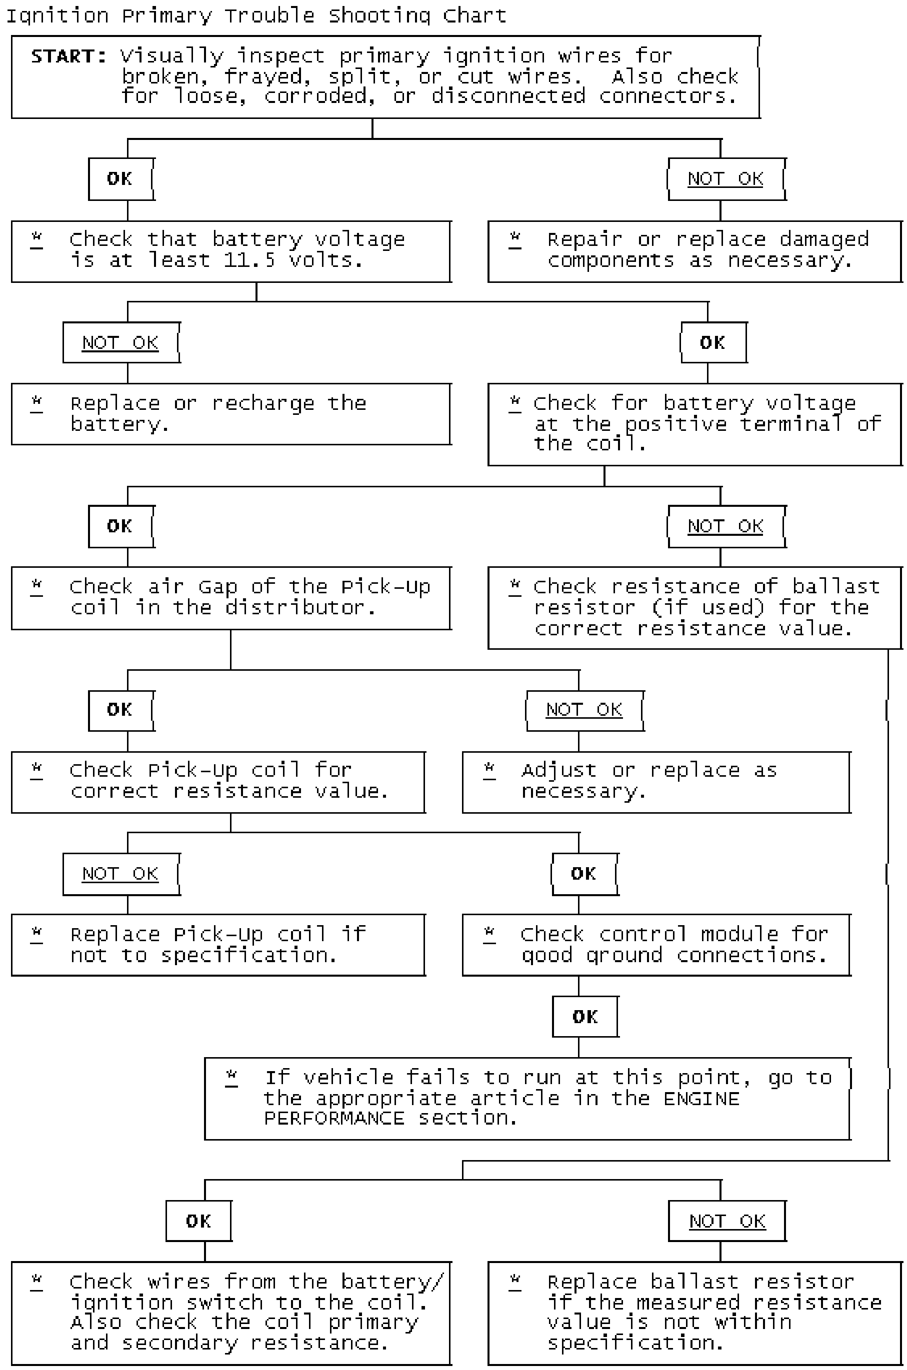

Fig. 2: Ignition Primary Trouble Shooting Chart

STARTER TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem**

symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BASIC STARTER TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Starter Fails to Operate	
Dead battery or bad connections between starter and battery	Check battery charge and all wires and connections to starter
Ignition switch faulty or misadjusted	Adjust or replace ignition switch
Open circuit between starter switch ignition terminal on starter relay	Check and repair wires and connections as necessary
Starter relay or starter defective	See Testing in STARTER article
Open solenoid pull-in wire	Testing in STARTER article
Starter Does Not Operate and Headlights Dim	
Weak battery or dead cell	Charge or replace battery as necessary
Loose or corroded battery connections	Check that battery connections are clean and tight
Internal ground in starter windings	See Testing in STARTER article
Grounded starter fields	See Testing in STARTERS
Armature rubbing on pole	See STARTER article shoes
Starter Turns but Engine Does Not Rotate	
Starter clutch slipping	See STARTER article
Broken clutch housing	See STARTER article
Pinion shaft rusted or dry	See STARTER article
Engine basic timing incorrect	See Ignition Timing in TUNE-UP article
Broken teeth on engine flywheel	Replace flywheel and check for starter pinion gear damage
Starter Will Not Crank Engine	
Faulty overrunning clutch	See STARTER article
Broken clutch housing	See STARTER article
Broken flywheel teeth	Replace flywheel and check for starter pinion gear damage
Armature shaft sheared or reduction gear teeth stripped	See STARTER article
Weak battery	Charge or replace battery as necessary
Faulty solenoid	See On-Vehicle Tests in STARTER article
Poor grounds	Check all ground connections for tight and clean connections
Ignition switch faulty or misadjusted	Adjust or replace ignition switch as necessary
Starter Cranks Engine Slowly	
Battery weak or defective	Charge or replace battery as necessary
Engine overheated	See ENGINE COOLING SYSTEM article
Engine oil too heavy	Check that proper viscosity oil is used

CONDITION & POSSIBLE CAUSE	CORRECTION
Poor battery-to-starter connections	Check that all between battery and starter are clean and tight
Current draw too low or too high	See Bench Tests in STARTER article
Bent armature, loose pole shoes screws or worn bearing	See STARTER article
Burned solenoid contacts	Replace solenoid
Faulty starter	Replace starter
Starter Engages Engine Only Momentarily	
Engine timing too far advanced	See Ignition Timing in TUNE-UP article
Overrunning clutch not engaging properly	Replace overrunning clutch. See STARTER article
Broken starter clutch	See STARTER article
Broken teeth on engine flywheel	Replace flywheel and check starter pinion gear for damage
Weak drive assembly thrust spring	See STARTER article
Weak hold-in coil	See Bench Tests in STARTER article
Starter Drive Will Not Engage	
Defective point assembly	See Testing in STARTER article
Poor point assembly ground	See Testing in STARTER article
Defective pull-in coil	Replace starter solenoid
Starter Relay Does Not Close	
Dead battery	Charge or replace battery as necessary
Faulty wiring	Check all wiring and connections leading to relay
Neutral safety switch faulty	Replace neutral safety switch
Starter relay faulty	Replace starter relay
Starter Drive Will Not Disengage	
Starter motor loose on mountings	Tighten starter attach bolts
Worn drive end bushing	See STARTER article
Damaged engine flywheel teeth	Replace flywheel and starter pinion gear for damage
Drive yolk return spring broken or missing	Replace return spring
Faulty ignition switch	Replace ignition switch
Insufficient clearance between winding leads to solenoid terminal and main contact in solenoid	Replace starter solenoid
Starter clutch not disengaging	Replace starter clutch
Ignition starter switch	Replace ignition switch contacts sticking
Starter Relay Operates but Solenoid Does Not	
Faulty solenoid switch, switch connections or relay	Check all wiring between relay and solenoid or replace relay or solenoid as necessary
Broken lead or loose soldered connections	Repair wire or wire connections as necessary
Solenoid Plunger Vibrates When Switch is Engaged	
Weak battery	Charge or replace battery as necessary

CONDITION & POSSIBLE CAUSE	CORRECTION
Solenoid contacts corroded	Clean contacts or replace solenoid
Faulty wiring	Check all wiring leading to solenoid
Broken connections inside switch cover	Repair connections or replace solenoid
Open hold-in wire	solenoid
Low Current Draw	
Worn brushes or weak brush springs	Replace brushes or brush springs as necessary
High Pitched Whine During Cranking Before Engine Fires but Engine Fires and Cranks Normally	
Distance too great between starter pinion and flywheel	Align starter or check that correct starter and flywheel are being used
High Pitched Whine After Engine Fires With Key released. Engine Fires and Cranks Normally	
Distance too small between starter pinion and flywheel	Flywheel runout contributes to the intermittent nature

AIR CONDITIONING & HEAT

AIR CONDITIONING TROUBLE SHOOTING

WARNING: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BASIC AIR CONDITIONING TROUBLE SHOOTING CHART

CONDITION	POSSIBLE CAUSE
Compressor Not Working	Compressor clutch circuit open.
.....	Compressor clutch coil inoperative.
.....	Poor clutch ground connection.
.....	Fan belts loose.
.....	Thermostatic switch inoperative.
.....	Thermostatic switch not adjusted.
.....	Ambient temperature switch open.
.....	Superheat fuse blown.
Excessive Noise or Vibration	Missing or loose mounting bolts.
.....	Bad idler pulley bearings.
.....	Fan belts not tightened correctly.
.....	Compressor clutch contacting body.
.....	Excessive system pressure.
.....	Compressor oil level low.
.....	Damaged clutch bearings.
.....	Damaged reed valves.
.....	Damaged compressor.

CONDITION	POSSIBLE CAUSE
Insufficient or No Cooling; Compressor Working	Expansion valve inoperative.
.....	Heater control valve stuck open.
.....	Low system pressure.
.....	Blocked condenser fins.
.....	Blocked evaporator fins.
.....	Vacuum system leak.
.....	Vacuum motors inoperative.
.....	Control cables improperly adjusted.
.....	Restricted air inlet.
.....	Mode doors binding.
.....	Blower motor inoperative.
.....	Temperature above system capacity.

HEATER SYSTEM TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

BASIC HEATER SYSTEM TROUBLE SHOOTING CHART

CONDITION	POSSIBLE CAUSE
Insufficient, Erratic, or No Heat	Low Coolant Level
.....	Incorrect thermostat.
.....	Restricted coolant flow through core.
.....	Heater hoses plugged.
.....	Misadjusted control cable.
.....	Sticking heater control valve.
.....	Vacuum hose leaking.
.....	Vacuum hose blocked.
.....	Vacuum motors inoperative.
.....	Blocked air inlet.
.....	Inoperative heater blower motor.
.....	Oil residue on heater core fins.
.....	Dirt on heater core fins.
Too Much Heat	Improperly adjusted cables.
.....	Sticking heater control valve.
.....	No vacuum to heater control valve.
.....	Temperature door stuck open.

CONDITION	POSSIBLE CAUSE
Air Flow Changes During Acceleration	Vacuum system leak.
.....	Bad check valve or reservoir.
Air From Defroster At All Times	Vacuum system leak.
.....	Improperly adjusted control cables.
.....	Inoperative vacuum motor.
Blower Does Not Operate Correctly	Blown fuse.
.....	Blower motor windings open.
.....	Resistors burned out.
.....	Motor ground connection loose.
.....	Wiring harness connections loose.
.....	Blower motor switch inoperative.
.....	Blower relay inoperative.
.....	Fan binding or foreign object in housing.
.....	Fan blades broken or bent.

BRAKES

BRAKE SYSTEM TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

BRAKE SYSTEM TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Brakes Pull Left or Right	
Incorrect tire pressure	Inflate tires to proper pressure
Front end out of alignment	See WHEEL ALIGNMENT
Mismatched tires	Check tires sizes
Restricted brake lines or hoses	Check hose routing
Loose or malfunctioning caliper	See DISC BRAKES or BRAKE SYSTEM
Bent shoe or oily linings	See DRUM BRAKES or BRAKE SYSTEM
Malfunctioning rear brakes	See DRUM, DISC BRAKES or BRAKE SYSTEM
Loose suspension parts	See SUSPENSION
Noises Without Brakes Applied	
Front linings worn out	Replace linings
Dust or oil on drums or rotors	See DRUM, DISC BRAKES or BRAKE SYSTEM
Noises With Brakes Applied	

CONDITION & POSSIBLE CAUSE	CORRECTION
Insulator on outboard shoe damaged	See DISC BRAKES or BRAKE SYSTEM
Incorrect pads or linings	Replace pads or linings
Brake Rough, Chatters or Pulsates	
Excessive lateral runout	Check rotor runout
Parallelism not to specifications	Reface or replace rotor
Wheel bearings not adjusted	See SUSPENSION
Rear drums out-of-round	Reface or replace drums
Disc pad reversed, steel against rotor	Remove and reinstall pad
Excessive Pedal Effort	
Malfunctioning power unit	See POWER BRAKES or BRAKE SYSTEM
Partial system failure	Check fluid and pipes
Worn disc pad or lining	Replace pad or lining
Caliper piston stuck or sluggish	See DISC BRAKES or BRAKE SYSTEM
Master cylinder piston stuck	See MASTER CYLINDERS or BRAKE SYSTEM
Brake fade due to incorrect pads for linings	Replace pads or linings
Linings or pads glazed	Replace pads or linings
Worn drums	Reface or replace drums
Excessive Pedal Travel	
Partial brake system failure	Check fluid and pipes
Insufficient fluid in master cylinder	See MASTER CYLINDERS or BRAKE SYSTEM
Air trapped in system	See BRAKE BLEEDING or BRAKE SYSTEM
Rear brakes not adjusted	See Adjustments in DRUM BRAKES or BRAKE SYSTEM
Bent shoe or lining	See DRUM BRAKES or BRAKE SYSTEM
Plugged master cylinder cap	See MASTER CYLINDERS or BRAKE SYSTEM
Improper brake fluid	Replace brake fluid
Pedal Travel Decreasing	
Compensating port plugged	See MASTER CYLINDERS or BRAKE SYSTEM
Swollen cup in master cylinder	See MASTER CYLINDERS or BRAKE SYSTEM
Master cylinder piston not returning	See MASTER CYLINDERS or BRAKE SYSTEM
Weak shoe retracting springs	See DRUM BRAKES BRAKE SYSTEM
Wheel cylinder piston sticking	See DRUM BRAKES or BRAKE SYSTEM
Dragging Brakes	
Master cylinder pistons not returning	See MASTER CYLINDERS BRAKE SYSTEM
Restricted brake lines or hoses	Check line routing
Incorrect parking brake adjustment	See DRUM BRAKES BRAKE SYSTEM

CONDITION & POSSIBLE CAUSE	CORRECTION
Parking Brake cables frozen	See DRUM BRAKES BRAKE SYSTEM
Incorrect installation of inboard disc pad	Remove and replace correctly
Power booster output rod too long	See POWER BRAKE UNITS BRAKE SYSTEM
Brake pedal not returning freely	See DISC, DRUM BRAKES BRAKE SYSTEM
Brakes Grab or Uneven Braking Action	
Malfunction of combination valve	See CONTROL VALVE or BRAKE SYSTEM
Malfunction of power brake unit	See POWER BRAKE UNITS or BRAKE SYSTEM
Binding brake pedal	See DISC, DRUM BRAKES or BRAKE SYSTEM
Pulsation or Roughness	
Uneven pad wear caused by caliper	See DISC BRAKES or BRAKE SYSTEM
Uneven rotor wear	See DISC BRAKES or BRAKE SYSTEM
Drums out-of-round	Reface or replace drums

ENGINE MECHANICAL

COOLING SYSTEM TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

COOLING SYSTEM TROUBLE SHOOTING

CONDITION & POSSIBLE CAUSE	CORRECTION
Overheating	
Coolant Leak	Fill/Pressure Test System
A/C Condenser Fins Clogged	Remove/Clean Condenser
Radiator Fins Clogged	Remove/Clean Radiator
Thermostat Stuck Closed	Replace Thermostat
Clogged Cooling System Passages	Clean/Flush Cooling System
Water Pump Malfunction	Replace Water Pump
Fan Clutch Malfunction	Replace Fan Clutch
Retarded Ignition Timing	Reset Ignition Timing
Cooling Fan Malfunction	Test Cooling Fan/Circuit
Cooling Fan Motor Malfunction	Test Fan Motor
Cooling Fan Relay Malfunction	Test Fan Relay
Faulty Radiator Cap	Replace Radiator Cap
Broken/Slipping Fan Belt	Replace Fan Belt
Restricted Exhaust	Repair Exhaust System
Corrosion	

CONDITION & POSSIBLE CAUSE	CORRECTION
Impurities In Coolant	Clean/Flush System
Coolant Leakage	
Damaged hose	Replace Hose
Leaky Water Pump	Replace Water Pump
Damaged Radiator Seam	Replace/Repair Radiator
Leaky Thermostat Cover	Replace Thermostat Cover
Cylinder Head Problem	Check Head/Head Gasket
Leaky Freeze Plugs	Replace Freeze Plugs
Recovery System Inoperative	
Loose and/or Defective Radiator Cap	Replace Radiator Cap
Overflow Tube Clogged and/or Leaking	Repair Tube
Recovery Bottle Vent Restricted	Clean Vent
No Heater Core Flow	
Collapsed Heater Hose	Replace Heater Hose
Plugged Heater Core	Clean/Replace Heater Core
Faulty Heater Valve	Replace Heater Valve

GASOLINE ENGINE - MECHANICAL TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

BASIC GASOLINE ENGINE - MECHANICAL TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Lopes At Idle	
Intake manifold-to-head leaks	Replace manifold gasket, See ENGINES
Blown head gasket	Replace head gasket, See ENGINES
Worn timing gears, chain or sprocket	Replace gears, chain or sprocket
Worn camshaft lobes	Replace camshaft, See ENGINES
Overheated engine	Check cooling system, See COOLING
Blocked crankcase vent valve	Remove restriction
Leaking EGR valve	Repair leak and/or replace valve
Faulty fuel pump	Replace fuel pump
Engine Has Low Power	
Leaking fuel pump	Repair leak and/or replace fuel pump
Excessive piston-to-bore clearance	Install larger pistons, See ENGINES
Sticking valves or weak valve springs	Check valve train components, See ENGINES
Incorrect valve timing	Reset valve timing, See ENGINES
Worn camshaft lobes	Replace camshaft, See ENGINES

CONDITION & POSSIBLE CAUSE	CORRECTION
Blown head gasket	Replace head gasket. See ENGINES.
Clutch slipping	Adjust pedal and/or replace components, See ENGINES
Engine overheating	Check cooling system, See COOLING
Auto. Trans. pressure regulator valve faulty	Replace pressure regulator valve
Auto. Trans. fluid level too low	Add fluid as necessary
Improper vacuum diverter valve operation	Replace vacuum diverter valve
Vacuum leaks	Inspect vacuum system and repair as required
Leaking piston rings	Replace piston rings, See ENGINES
Faulty High Speed Operation	
Low fuel pump volume	Replace fuel pump
Leaking valves or worn	Replace valves and/or springs, See ENGINES
Incorrect valve timing	Reset valve timing,See ENGINES
Intake manifold restricted	Remove restriction
Worn distributor shaft	Replace distributor
Faulty Acceleration	
Improper fuel pump stroke	Remove pump and reset pump stroke
Incorrect ignition timing	Reset ignition timing, See TUNE-UP
Leaking valves	Replace valves, See ENGINES
Worn fuel pump diaphragm or piston	Replace diaphragm or piston
Intake Backfire	
Improper ignition timing	Reset ignition timing, See TUNE-UP
Faulty accelerator pump discharge	Replace accelerator pump
Improper choke operation	Check choke and adjust as required
Defective EGR valve	Replace EGR valve
Fuel mixture too lean	Reset air/fuel mixture, See TUNE-UP
Choke valve initial clearance too large	Reset choke valve initial clearance
Exhaust Backfire	
Vacuum leak	Inspect and repair vacuum system
Faulty vacuum diverter valve	Replace vacuum diverter valve
Faulty choke operation	Check choke and adjust as required
Exhaust system leak	repair exhaust system leak
Engine Detonation	
Ignition timing too far advanced	Reset ignition timing, See TUNE-UP
Faulty ignition system	Check ignition timing, See TUNE-UP
Spark plugs loose or faulty	Retighten or replace plugs
Fuel delivery system clogged	Inspect lines, pump and filter for clog
EGR valve inoperative	Replace EGR valve
PCV system inoperative	Inspect and/or replace hoses or valve
Vacuum leaks	Check vacuum system and repair leaks
Excessive combustion chamber deposits	Remove built-up deposits

CONDITION & POSSIBLE CAUSE	CORRECTION
Leaking, sticking or broken valves	Inspect and/or replace valves
External Oil Leakage	
Fuel pump improperly seated or worn gasket	Remove pump, replace gasket and seat properly
Oil pan gasket broken or pan bent	Straighten pan and replace gasket
Timing chain cover gasket broken	Replace timing chain cover gasket
Rear main oil seal worn	Replace rear main oil seal
Oil pan drain plug not seated properly	Remove and reinstall drain plug
Camshaft bearing drain hole blocked	Remove restriction
Oil pressure sending switch leaking	Remove and reinstall sending switch
Excessive Oil Consumption	
Worn valve stems or guides	Replace stems or guides, See ENGINES
Valve "O" ring seals damaged	Replace "O" ring seals, See ENGINES
Plugged oil drain back holes	Remove restrictions
Improper PCV valve operation	Replace PCV valve
Engine oil level too high	Remove excess oil
Engine oil too thin	Replace thicker oil
Valve stem oil deflectors damaged	Replace oil deflectors
Incorrect piston rings	Replace piston rings, See ENGINES
Piston ring gaps not staggered	Reinstall piston rings, See ENGINES
Insufficient piston ring tension	Replace rings, See ENGINES
Piston ring grooves or oil return	slots clogged Replace piston rings, See ENGINES
Piston rings sticking in grooves	Replace piston rings, See ENGINES
Piston ring grooves excessively worn	Replace piston and rings, See ENGINES
Compression rings installed upside down	Replace compression rings correctly, See ENGINES
Worn or scored cylinder walls	Rebore cylinders or replace block
Mismatched oil ring expander and rail	Replace oil ring expander and rail, See ENGINES
Intake gasket dowels too long	Replace intake gasket dowels
Excessive main or connecting rod bearing clearance	Replace main or connecting rod bearings, See ENGINES
No Oil Pressure	
Low oil level	Add oil to proper level
Oil pressure sender or gauge broken	Replace sender or gauge
Oil pump malfunction	Remove and overhaul oil pump, See ENGINES
Oil pressure relief valve sticking	Remove and reinstall valve
Oil pump passages blocked	Overhaul oil pump, See ENGINES
Oil pickup screen or tube blocked	Remove restriction
Loose oil inlet tube	Tighten oil inlet tube
Loose camshaft bearings	Replace camshaft bearings, See ENGINES

CONDITION & POSSIBLE CAUSE	CORRECTION
Internal leakage at oil passages	Replace block or cylinder head
Low Oil Pressure	
Low engine oil level	Add oil to proper level
Engine oil too thin	Remove and replace with thicker oil
Excessive oil pump clearance	Reduce oil pump clearance, See ENGINES
Oil pickup tube or screen blocked	Remove restrictions
Main, rod or cam bearing clearance excessive	Replace bearing to reduce clearance, See ENGINES
High Oil Pressure	
Improper grade of oil	Replace with proper oil
Oil pressure relief valve stuck closed	Eliminate binding
Oil pressure sender or gauge faulty	Replace sender or gauge
Noisy Main Bearings	
Inadequate oil supply	Check oil delivery to main bearings
Excessive main bearing clearance	Replace main bearings, See ENGINES
Excessive crankshaft end play	Replace crankshaft, See ENGINES
Loose flywheel or torque converter	Tighten attaching bolts
Loose or damaged vibration damper	Tighten or replace vibration damper
Crankshaft journals out-of-round	Re-grind crankshaft journals
Excessive belt tension	Loosen belt tension
Noisy Connecting Rods	
Excessive bearing clearance or missing bearing	Replace bearing, See ENGINES
Crankshaft rod journal out-of-round	Re-grind crankshaft journal
Misaligned connecting rod or cap	Remove rod or cap and realign
Incorrectly tightened rod bolts	Remove and re-tighten rod bolts
Noisy Pistons and Rings	
Excessive piston-to-bore clearance	Install larger pistons, See ENGINES
Bore tapered or out-of-round	Rebore block
Piston ring broken	Replace piston rings, See ENGINES
Piston pin loose or seized	Replace piston pin, See ENGINES
Connecting rods misaligned	Realign connecting rods
Ring side clearance too loose or tight	Replace with larger or smaller rings
Carbon build-up on piston	Remove carbon
Noisy Valve Train	
Worn or bent push rods	Replace push rods, See ENGINES
Worn rocker arms or bridged pivots	Replace push rods, See ENGINES
Dirt or chips in valve lifters	Remove lifters and remove dirt/chips
Excessive valve lifter leak-down	Replace valve lifters, See ENGINES
Valve lifter face worn	Replace valve lifters, See ENGINES
Broken or cocked valve springs	Replace or reposition springs
Too much valve stem-to-guide clearance	Replace valve guides, See ENGINES

CONDITION & POSSIBLE CAUSE	CORRECTION
Valve bent	Replace valve, See ENGINES
Loose rocker arms	Retighten rocker arms, See ENGINES
Excessive valve seat run-out	Reface valve seats, See ENGINES
Missing valve lock	Install new valve lock
Excessively worn camshaft lobes	Replace camshaft, See ENGINES
Plugged valve lifter oil holes	Eliminate restriction or replace lifter
Faulty valve lifter check ball	Replace lifter check ball, See ENGINES
Rocker arm nut installed upside down	Remove and reinstall correctly
Valve lifter incorrect for engine	Remove and replace valve lifters
Faulty push rod seat or lifter plunger	Replace plunger or push rod
Noisy Valves	
Improper valve lash	Re-adjust valve lash, See ENGINES
Worn or dirty valve lifters	Clean and/or replace lifters
Worn valve guides	Replace valve guides, See ENGINES
Excessive valve seat or face run-out	Reface seats or valve face
Worn camshaft lobes	Replace camshaft, See ENGINES
Loose rocker arm studs	Re-tighten rocker arm studs, See ENGINES
Bent push rods	Replace push rods, See ENGINES
Broken valve springs	Replace valve springs, See ENGINES
Burned,Sticking or Broken Valves	
Weak valve springs or warped valves	Replace valves and/or springs, See ENGINES
Improper lifter clearance	Re-adjust clearance or replace lifters
Worn guides or improper guide clearance	Replace valve guides, See ENGINES
Out-of-round valve seats or improper seat width	Re-grind valve seats
Gum deposits on valve stems, seats or guide	Remove deposits
Improper spark timing	Re-adjust spark timing
Broken Pistons/Rings	
Undersize pistons	Replace with larger pistons, See ENGINES
Wrong piston rings	Replace with correct rings, See ENGINES
Out-of-round cylinder bore	Re-bore cylinder bore
Improper connecting rod alignment	Remove and realign connecting rods
Excessively worn ring grooves	Replace pistons, See ENGINES
Improperly assembled piston pins	Re-assemble pin-to-piston, See ENGINES
Insufficient ring gap clearance	Install new rings, See ENGINES
Engine overheating	Check cooling system
Incorrect ignition timing	Re-adjust ignition timing, See TUNE-UP
Excessive Exhaust Noise	
Leaks at manifold to head, or to pipe	Replace manifold or pipe gasket
Exhaust manifold cracked or broken	Replace exhaust manifold, See ENGINES

ENGINE PERFORMANCE

CARBURETOR TROUBLE SHOOTING:

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

BASIC COLD START SYMPTOMS TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Won't Start	
Choke not closing	Check choke operation, see FUEL SYSTEMS
Choke linkage bent	Check linkage, see FUEL SYSTEM
Engine Starts, Then Dies	
Choke vacuum kick setting too wide	Check setting and adjust see, FUEL SYSTEMS
Fast idle RPM too low	Reset RPM to specification, see TUNE-UP
Fast idle cam index incorrect	Reset fast idle cam index, see FUEL SYSTEMS
Vacuum leak	Inspect vacuum system for leaks
Low fuel pump outlet	Repair or replace pump, see FUEL SYSTEMS
Low carburetor fuel level	Check float setting see FUEL SYSTEM
Engine Quits Under Load	
Choke vacuum kick setting incorrect	Reset vacuum kick setting,see FUEL SYSTEMS
Fast idle cam index incorrect	Reset fast idle cam index, see FUEL SYSTEM
Incorrect hot fast idle speed RPM	Reset fast idle RPM, see TUNE-UP
Engine Starts, Runs Up, Then Idles, Slowly With Black Smoke	
Choke vacuum kick set too narrow	Reset vacuum kick, see FUEL SYSTEMS
Fast idle cam index incorrect	Reset fast idle cam index, see FUEL SYSTEMS
Hot fast idle RPM too low	Reset fast idle RPM, see TUNE-UP

BASIC HOT START SYMPTOMS TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Won't Start	
Engine flooded	Allow fuel to evaporate

BASIC COLD ENGINE DRIVEABILITY SYMPTOMS TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Stalls in Gear	
Choke vacuum kick setting incorrect	Reset choke vacuum kick, see FUEL SYSTEMS
Fast idle RPM incorrect	Reset fast idle RPM, see TUNE-UP
Fast idle cam index incorrect	Reset fast idle cam see FUEL SYSTEMS
Acceleration Sag or Stall	
Defective choke control switch	Replace choke control switch
Choke vacuum kick setting incorrect	Reset choke vacuum kick see, FUEL SYSTEMS
Float level incorrect (too low)	Adjust float level, FUEL SYSTEMS

CONDITION & POSSIBLE CAUSE	CORRECTION
Accelerator pump defective	Repair or replace pump see FUEL SYSTEMS
Secondary throttles not closed	Inspect lockout adjustment, see FUEL SYSTEMS
Sag or Stall After Warmup	
Defective choke control switch	Replace choke control switch, see FUEL SYSTEMS
Defective accelerator pump	Replace pump, see FUEL SYSTEMS
Float level incorrect (too low)	Adjust float level, see FUEL SYSTEMS
Backfiring & Black Smoke	
Plugged heat crossover system	Remove restriction

BASIC WARM ENGINE DRIVEABILITY SYMPTOMS TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Hesitation With Small Amount of Gas Pedal Movement	
Vacuum leak	Inspect vacuum lines
Accelerator pump weak or inoperable	Replace pump, see FUEL SYSTEMS
Float level setting too low	Reset float level, see,FUEL SYSTEMS
Metering rods sticking or binding	Inspect and/or replace rods, see FUEL SYSTEMS
Carburetor idle or transfer system plugged	Inspect system and remove restriction
Frozen or binding heated air inlet	Inspect heated air door for binding
Hesitation With Heavy Gas Pedal Movement	
Defective accelerator pump	Replace pump, see FUEL SYSTEMS
Metering rod carrier sticking or binding	Remove restriction
Large vacuum leak	Inspect vacuum system and repair leak
Float level setting too low	Reset float level, see FUEL SYSTEMS
Defective fuel pump, lines or filter	Inspect pump, lines and filter
Air door setting incorrect	Adjust air door setting, see FUEL

DIESEL ENGINE TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

NOTE: **Diesel engines mechanical diagnosis is the same as gasoline engines for items such as noisy valves, bearings, pistons, etc. The following trouble shooting covers only items pertaining to diesel engines.**

BASIC DIESEL ENGINE TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Won't Crank	
Bad battery connections or dead batteries	Check connections and/or replace batteries

CONDITION & POSSIBLE CAUSE	CORRECTION
Bad starter connections or bad starter	Check connections and/or replace starter
Engine Cranks Slowly, Won't Start	
Bad battery connections or dead batteries	Check connections and/or replace batteries
Engine oil too heavy	Replace engine oil
Engine Cranks Normally, But Will Not Start	
Glow plugs not functioning	Check glow plug system, see FUEL SYSTEMS
Glow plug control not functioning	Check controller, see FUEL SYSTEMS
Fuel not injected into cylinders	Check fuel injectors, see FUEL SYSTEMS
No fuel to injection pump	Check fuel delivery system
Fuel filter blocked	Replace fuel filter
Fuel tank filter blocked	Replace fuel tank filter
Fuel pump not operating	Check pump operation and/or replace pump
Fuel return system blocked	Inspect system and remove restriction
No voltage to fuel solenoid	Check solenoid and connections
Incorrect or contaminated fuel	Replace fuel
Incorrect injection pump timing	Re-adjust pump timing, see FUEL SYSTEMS
Low compression	Check valves, pistons, rings, see ENGINES
Injection pump malfunction	Inspect and/or replace injection pump
Engine Starts, Won't Idle	
Incorrect slow idle adjustment	Reset idle adjustment, see TUNE-UP
Fast idle solenoid malfunctioning	Check solenoid and connections
Fuel return system blocked	Check system and remove restrictions
Glow plugs go off too soon	See glow plug diagnosis in FUEL SYSTEMS
Injection pump timing incorrect	Reset pump timing, see FUEL SYSTEMS
No fuel to injection pump	Check fuel delivery system
Incorrect or contaminated fuel	Replace fuel
Low compression	Check valves, piston, rings, see ENGINES
Injection pump malfunction	Replace injection pump, see FUEL SYSTEMS
Fuel solenoid closes in RUN position	Check solenoid and connections
Engines Starts/Idles Rough W/out Smoke or Noise	
Incorrect slow idle adjustment	Reset slow idle, see TUNE-UP
Injection line fuel leaks	Check lines and connections
Fuel return system blocked	Check lines and connections
Air in fuel system	Bleed air from system
Incorrect or contaminated fuel	Replace fuel
Injector nozzle malfunction	Check nozzles, see FUEL SYSTEMS
Engines Starts and Idles Rough W/out Smoke or Noise, But Clears After Warm-Up	
Injection pump timing incorrect	Reset pump timing, see FUEL SYSTEMS
Engine not fully broken in	Put more miles on engine
Air in system	Bleed air from system
Injector nozzle malfunction	Check nozzles, see FUEL SYSTEMS

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Idles Correctly, Misfires Above Idle	
Blocked fuel filter	Replace fuel filter
Injection pump timing incorrect	Reset pump timing, see FUEL SYSTEMS
Incorrect or contaminated fuel	Replace fuel
Engine Won't Return To Idle	
Fast idle adjustment incorrect	Reset fast idle, see TUNE-UP
Internal injection pump malfunction	Replace injection pump, see FUEL SYSTEMS
External linkage binding	Check linkage and remove binding
Fuel Leaks On Ground	
Loose or broken fuel line	Check lines and connections
Internal injection pump seal leak	Replace injection pump, see FUEL SYSTEMS
Cylinder Knocking Noise	
Injector nozzles sticking open	Test injectors, see FUEL SYSTEMS
Very low nozzle opening pressure	Test injectors and/or replace
Loss of Engine Power	
Restricted air intake	Remove restriction
EGR valve malfunction	Replace EGR valve
Blocked or damaged exhaust system	Remove restriction and/or replace components
Blocked fuel tank filter	Replace filter
Restricted fuel filter	Remove restriction and/or replace filter
Block vent in gas cap	Remove restriction and/or replace cap
Tank-to-injection pump fuel supply blocked	Check fuel lines and connections
Blocked fuel return system	Remove restriction
Incorrect or contaminated fuel	Replace fuel
Blocked injector nozzles	Check nozzle for blockage, see FUEL SYSTEMS
Low compression	Check valves, rings, pistons, see ENGINES
Loud Engine Noise With Black Smoke	
Basic timing incorrect	Reset timing, see FUEL SYSTEMS
EGR valve malfunction	Replace EGR valve
Internal injection pump malfunction	Replace injection pump, see FUEL SYSTEMS
Incorrect injector pump housing pressure	Check pressure, see FUEL SYSTEMS
Engine Overheating	
Cooling system leaks	Check cooling system and repair leaks
Belt slipping or damaged	Check tension and/or replace belt
Thermostat stuck closed	Remove and replace thermostat, see ENGINE COOLING
Head gasket leaking	Replace head gasket
Oil Light on at Idle	
Low oil pump pressure	Check oil pump operation, see ENGINES
Oil cooler or line restricted	Remove restriction and/or replace cooler
Engine Won't Shut Off	

CONDITION & POSSIBLE CAUSE	CORRECTION
Injector pump fuel solenoid does not return fuel valve to OFF position	Remove and check solenoid and replace if needed

VACUUM PUMP DIAGNOSIS

CONDITION & POSSIBLE CAUSE	CORRECTION
Excessive Noise	
Loose pump-to-drive assembly screws	Tighten screws
Loose tube on pump assembly	Tighten tube
Valves not functioning properly	Replace valves
Oil Leakage	
Loose end plug	Tighten end plug
Bad seal crimp	Remove and re-crimp seal

FUEL INJECTION TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

BASIC FUEL INJECTION TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Won't Start (Cranks Normally)	
Cold start valve inoperative	Test valve and circuit
Poor connection;vacuum or wiring	Check vacuum and electrical connections
Contaminated fuel	Test fuel for water or alcohol
Defective fuel pump relay or circuit	Test relay and wiring
Battery too low	Charge and test battery
Low fuel pressure	Test pressure regulator and fuel pump, check for restricted lines and filters
No distributor reference pulses	Repair ignition system as necessary
Open coolant temperature sensor circuit	Test sensor and wiring
Shorted W.O.T. switch in T.P.S.	Disconnect W.O.T. switch, engine should start
Defective ECM	Replace ECM
Fuel tank residual pressure valve leaks	Test for fuel pressure drop after shut down
Hard Starting	
Disconnected hot air tube to air cleaner	Reconnect tube and test control valve
Defective Idle Air Control (IAC) valve	Test valve operation and circuit
Shorted, open or misadjusted T.P.S.	Test and adjust or replace T.P.S.
EGR valve open	Test EGR valve and control circuit
Poor Oxygen sensor signal	Test for shorted or circuit
Incorrect mixture from PCV system	Test PCV for flow, check sealing of oil filter cap

CONDITION & POSSIBLE CAUSE	CORRECTION
Poor High Speed Operation	
Low fuel pump volume	Faulty pump or restricted fuel lines or filters
Poor MAP sensor signal	Test MAP sensor, vacuum hose and wiring
Poor Oxygen sensor signal	Test for shorted or open sensor or circuit
Open coolant temperature sensor circuit	Test sensor and wiring
Faulty ignition operation	Check wires for cracks or poor con- nections, test secondary voltage with oscilloscope
Contaminated fuel	Test fuel for water or alcohol
Intermittent ECM ground	Test ECM ground connection for resistance
Restricted air cleaner	Replace air cleaner
Restricted exhaust system	Test for exhaust manifold back pressure
Poor MAF sensor signal	Check leakage between sensor and manifold
Poor VSS signal	If tester for ALCL hook-up is available check that VSS reading matches speedometer
Ping or Knock on Acceleration	
Poor Knock sensor signal	Test for shorted or open sensor or circuit
Poor Baro sensor signal	Test for shorted or open sensor or circuit
Improper ignition timing	See VEHICLE EMISSION CONTROL LABEL (where applicable)
Check for engine overheating problems	Low coolant, loose belts or electric cooling fan inoperative

NOTE: **For additional electronic fuel injection trouble shooting information, see the appropriate article in the ENGINE PERFORMANCE section (not all vehicles have Computer Engine Control articles). Information is provided there for diagnosing fuel system problems on vehicles with electronic fuel injection.**

IGNITION SYSTEM TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

Ignition Secondary Trouble Shooting Chart

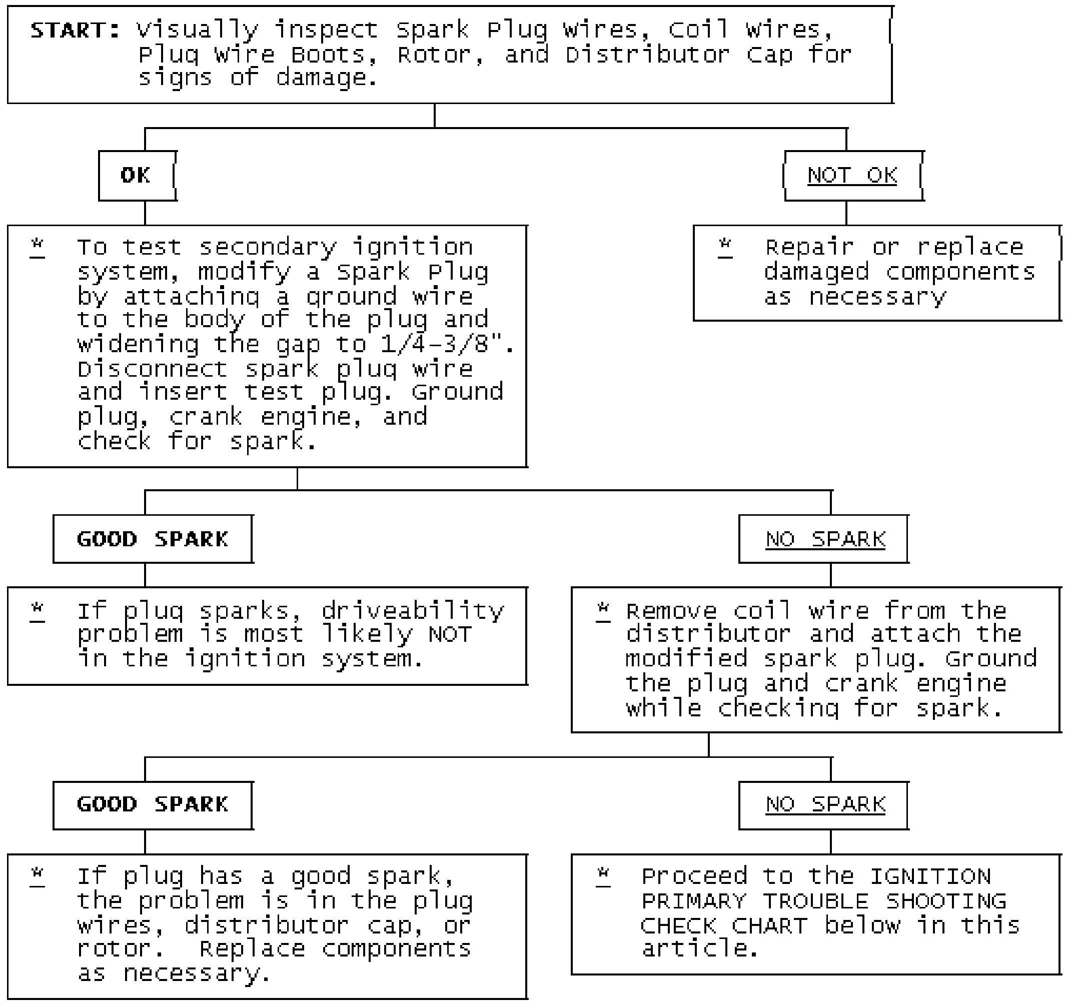

Fig. 3: Ignition Secondary Trouble Shooting Chart

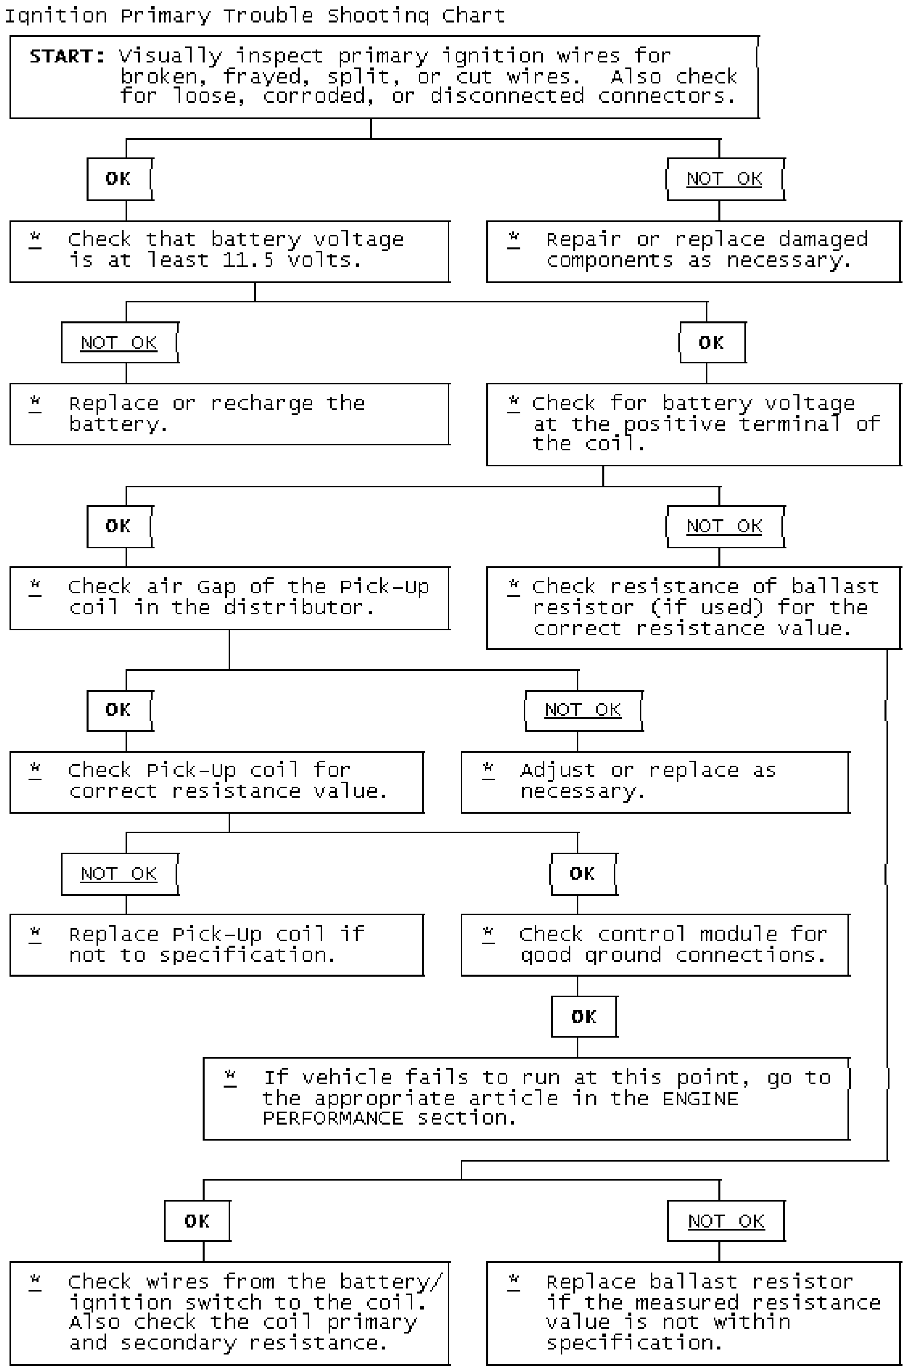

[Fig. 4: Ignition Primary Trouble Shooting Chart]

STARTER TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem**

symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BASIC STARTER TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Starter Fails to Operate	
Dead battery or bad connections between starter and battery	Check battery charge and all wires and connections to starter
Ignition switch faulty or misadjusted	Adjust or replace ignition switch
Open circuit between starter switch ignition terminal on starter relay	Check and repair wires and connections as necessary
Starter relay or starter defective	See Testing in STARTER article
Open solenoid pull-in wire	See Testing in STARTER article
Starter Does Not Operate and Headlights Dim	
Weak battery or dead cell	Charge or replace battery as necessary
Loose or corroded battery connections	Check that battery connections are clean and tight
Internal ground in starter windings	See Testing in STARTER article
Grounded starter fields	See Testing in STARTERS
Armature rubbing on pole shoes	See STARTER article
Starter Turns but Engine Does Not Rotate	
Starter clutch slipping	See STARTER article
Broken clutch housing	See STARTER article
Pinion shaft rusted or dry	See STARTER article
Engine basic timing incorrect	See Ignition Timing in TUNE-UP article
Broken teeth on engine flywheel	Replace flywheel and check for starter pinion gear damage
Starter Will Not Crank Engine	
Faulty overrunning clutch	See STARTER article
Broken clutch housing	See STARTER article
Broken flywheel teeth	Replace flywheel and check for starter pinion gear damage
Armature shaft sheared or reduction gear teeth stripped	See STARTER article
Weak battery	Charge or replace battery as necessary
Faulty solenoid	See On-Vehicle Tests in STARTER article
Poor grounds	Check all ground connections for tight and clean connections
Ignition switch faulty or misadjusted	Adjust or replace ignition switch as necessary
Starter Cranks Engine Slowly	
Battery weak or defective	Charge or replace battery as necessary
Engine overheated	See ENGINE COOLING SYSTEM article
Engine oil too heavy	Check that proper viscosity oil is used

CONDITION & POSSIBLE CAUSE	CORRECTION
Poor battery-to-starter connections	Check that all between battery and starter are clean and tight
Current draw too low or too high	See Bench Tests in STARTER article
Bent armature, loose pole shoes screws or worn bearings	See STARTER article
Burned solenoid contacts	Replace solenoid
Faulty starter	Replace starter
Starter Engages Engine Only Momentarily	
Engine timing too far advanced	See Ignition Timing in TUNE-UP article
Overrunning clutch not engaging properly	Replace overrunning clutch. See STARTER article
Broken starter clutch	See STARTER article
Broken teeth on engine flywheel	Replace flywheel and check starter pinion gear for damage
Weak drive assembly thrust spring	See STARTER article
Weak hold-in coil	See Bench Tests in STARTER article
Starter Drive Will Not Engage	
Defective point assembly	See Testing in STARTER article
Poor point assembly ground	See Testing in STARTER article
Defective pull-in coil	Replace starter solenoid
Starter Relay Does Not Close	
Dead battery	Charge or replace battery as necessary
Faulty wiring	Check all wiring and connections leading to relay
Neutral safety switch faulty	Replace neutral safety switch
Starter relay faulty	Replace starter relay
Starter Drive Will Not Disengage	
Starter motor loose on mountings	Tighten starter attach bolts
Worn drive end bushing	See STARTER article
Damaged engine flywheel teeth	Replace flywheel and starter pinion gear for damage
Drive yolk return spring broken or missing	Replace return spring
Faulty ignition switch	Replace ignition switch
Insufficient clearance between winding leads to solenoid terminal and main contact in solenoid	Replace starter solenoid
Starter clutch not disengaging	Replace starter clutch
Ignition starter switch contacts sticking	Replace ignition switch
Starter Relay Operates but Solenoid Does Not	
Faulty solenoid switch, switch connections or relay	Check all wiring between relay and solenoid or replace relay or solenoid as necessary
Broken lead or loose soldered connections	Repair wire or wire connections as necessary
Solenoid Plunger Vibrates When Switch is Engaged	

CONDITION & POSSIBLE CAUSE	CORRECTION
Weak battery	Charge or replace battery as necessary
Solenoid contacts corroded	Clean contacts or replace solenoid
Faulty wiring	Check all wiring leading to solenoid
Broken connections inside switch cover	Repair connections or replace solenoid
Open hold-in wire	Replace solenoid
Low Current Draw	
Worn brushes or weak	Replace brushes or brush springs as necessary
High Pitched Whine During Cranking Before Engine Fires but Engine Fires and Cranks Normally	
Distance too great between starter pinion and flywheel	Align starter or check that correct starter and flywheel are being used
High Pitched Whine After Engine Fires With Key released. Engine Fires and Cranks Normally	
Distance too small between starter pinion and flywheel	Flywheel runout contributes to the intermittent nature

TUNE-UP TROUBLE SHOOTING - GAS ENGINE VEHICLES

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

BASIC SPARK PLUG TROUBLE SHOOTING CHARTS

CONDITION & POSSIBLE CAUSE	CORRECTION
Normal Spark Plug Condition	
Light Tan or Gray deposits	No Action
Electrode not burned or fouled	No Action
Gap tolerance not changed	No Action
Cold Fouling or Carbon Deposits	
Overrich air/fuel mixture	Adjust air/fuel mixture, see ENGINE PERFORMANCE section
Faulty choke	Replace choke assembly, see ENGINE PERFORMANCE section
Clogged air filter	Clean and/or replace air filter
Incorrect idle speed or dirty carburetor	Reset idle speed and/ or clean carburetor
Faulty ignition wires	Replace ignition wiring
Prolonged operation at idle	Shut engine off during long idle
Sticking valves or worn valve guide seals	Check valve train
Wet Fouling or Oil Deposits	
Worn rings and pistons	Install new rings and pistons
Excessive cylinder wear	Rebore or replace block
Excessive valve guide clearance	Worn or loose bearing
Gap Bridged	

CONDITION & POSSIBLE CAUSE	CORRECTION
Deposits in combustion chamber becoming fused to electrode	Clean combustion chamber of deposits
Blistered Electrode	
Engine overheating	Check cooling system
Wrong type of fuel	Replace with correct fuel
Loose spark plugs	Retighten spark plugs
Over-advanced ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Pre-Ignition or Melted Electrodes	
Incorrect type of fuel	Replace with correct fuel
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Burned valves	Replace valves
Engine Overheating	Check cooling system
Wrong type of spark plug, too hot	Replace with correct spark plug, see ENGINE PERFORMANCE
Chipped Insulators	
Severe detonation	Check for over-advanced timing or combustion
Improper gapping procedure	Re-gap spark plugs
Rust Colored Deposits	
Additives in unleaded fuel	Try different fuel brand
Water In Combustion Chamber	
Blown head gasket or cracked head	Repair or replace head or head gasket

NOTE: **Before diagnosing an electronic ignition system, ensure that all wiring is connected properly between distributor, wiring connector and spark plugs. Ignition problem will show up either as: Engine Will Not Start or Engine Runs Rough.**

BASIC ELECTRONIC IGNITION TROUBLE SHOOTING CHARTS

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Won't Start	
Open circuit between distributor and bulkhead connector	Repair circuit
Open circuit between bulkhead connector and ignition switch	Repair circuit
Open circuit between ignition switch and starter solenoid	Repair circuit
Engine Runs Rough	
Fuel lines leaking or clogged	Tighten fitting, remove restriction
Initial timing incorrect	Reset ignition timing see ENGINE PERFORMANCE
Centrifugal advance malfunction	Repair distributor advance

CONDITION & POSSIBLE CAUSE	CORRECTION
Defective spark plugs or wiring	Replace plugs or plug wiring
Component Failure	
Spark arc-over on cap, rotor or coil	Replace cap, rotor or or coil
Defective pick-up coil	Replace pick-up coil
Defective ignition coil	Replace ignition coil
Defective vacuum unit	Replace vacuum unit
Defective control module	Replace control module

BASIC ELECTRONIC IGNITION TROUBLE SHOOTING CHARTS - USING OSCILLOSCOPE PATTERNS

CONDITION & POSSIBLE CAUSE	CORRECTION
Firing Voltage Lines are the Same, but Abnormally High	
Retarded ignition timing	Reset ignition timing, see ENGINE PERFORMANCE section
Fuel mixture too lean	Readjust carburetor, see ENGINE PERFORMANCE
High resistance in coil wire	Replace coil wire
Corrosion in coil tower terminal	Clean and/or replace coil
Corrosion in distributor coil terminal	Clean and/or replace distributor cap
Firing Voltage Lines are the Same but Abnormally Low	
Fuel mixture too rich	Readjust carburetor, see ENGINE PERFORMANCE
Breaks in coil wire causing arcing	Replace coil wire
Cracked coil tower causing arcing	Replace coil
Low coil output	Replace coil
Low engine compression	Determine cause and repair
One or More, But Not All Firing Voltage Lines are Higher Than Others	
Carburetor idle mixture not balanced	Readjust carburetor, see ENGINE PERFORMANCE
EGR valve stuck open	Clean and/or replace valve
High resistance in spark plug wires	Replace spark plug wires
Cracked or broken spark plug insulator	Replace spark plugs
Intake vacuum leak	Repair leak
Defective spark plugs	Replace spark plugs
Corroded spark plug terminals	Replace spark plugs
One or More, But Not All Firing Voltage Lines Are Lower Than Others	
Curb idle mixture not balanced	Readjust carburetor, see ENGINE PERFORMANCE
Breaks in plug wires	Replace plug wires causing arcing
Cracked coil tower causing arcing	Replace coil
Low compression	Determine cause and repair
Defective spark plugs	Replace spark plugs

CONDITION & POSSIBLE CAUSE	CORRECTION
Corroded spark plugs	Replace spark plugs
Cylinders Not Firing	
Cracked distributor cap terminals	Replace distributor cap
Shorted spark plug wire	Determine cause and repair
Mechanical problem in engine	Determine cause and repair
Defective spark plugs	Replace spark plugs
Spark plugs fouled	Replace spark plugs

BASIC DRIVEABILITY PROBLEMS TROUBLE SHOOTING

CONDITION & POSSIBLE CAUSE	CORRECTION
Hard Starting	
Binding carburetor linkage	Eliminate binding
Binding choke linkage	Eliminate binding
Binding choke piston	Eliminate binding
Restricted choke vacuum	Check vacuum lines for blockage
Worn or dirty needle valve and seat	Clean carburetor, see ENGINE PERFORMANCE
Float sticking	Readjust or replace float see the ENGINE PERFORMANCE section
Incorrect choke adjustment	Reset choke adjustment see ENGINE PERFORMANCE
Defective coil	Replace coil
Improper spark plug gap	Regap spark plugs
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Detonation	
Over-advanced ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Defective spark plugs	Replace spark plugs
Fuel lines clogged	Clean fuel lines
EGR system malfunction	Check and repair EGR system
PCV system malfunction	Repair PCV system
Vacuum leaks	Check and repair vacuum system
Loose fan belts	Tighten or replace fan belts, see ENGINE PERFORMANCE
Restricted airflow	Remove restriction
Vacuum advance malfunction	Check distributor operation
Dieseling	
Binding carburetor linkage	Eliminate binding
Binding throttle linkage	Eliminate blinding
Binding choke linkage or fast idle cam	Eliminate binding

CONDITION & POSSIBLE CAUSE	CORRECTION
Defective idle solenoid	Replace idle solenoid see ENGINE PERFORMANCE
Improper base idle speed	Reset idle speed, see see ENGINE PERFORMANCE
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Incorrect idle mixture setting	Reset idle mixture, see ENGINE PERFORMANCE
Faulty Acceleration	
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Engine cold and choke too lean	Adjust choke and allow engine to warm-up
Defective spark plugs	Replace spark plugs
Defective coil	Replace coil
Faulty Low Speed Operation	
Clogged idle transfer slots	Clean idle transfer slots, see FUEL
Restricted idle air bleeds and passages	Disassemble and clean carburetor, see FUEL
Clogged air cleaner	Replace air filter
Defective spark plugs	Replace spark plugs
Defective ignition wires	Replace ignition wire see ENGINE PERFORMANCE
Defective distributor cap	Replace distributor cap
Faulty High Speed Operation	
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Defective distributor centrifugal advance	Replace advance mechanism
Defective distributor vacuum advance	Replace advance unit
Incorrect spark plugs or plug gap	Check gap and/or replace spark plugs
Faulty choke operation	Check choke and repair as required
Clogged vacuum passages	Remove restrictions
Improper size or clogged main jet	Check jet size and clean, see FUEL
Restricted air cleaner	Check filter and replace as necessary
Defective distributor cap, rotor or coil	Replace cap, rotor or coil
Misfire at All Speeds	
Defective spark plugs	Replace spark plugs
Defective spark plug wires	Replace spark plug wires
Defective distributor cap, rotor, or coil	Replace cap, rotor, or coil
Cracked or broken vacuum hoses	Replace vacuum hoses
Vacuum leaks	Repair vacuum leaks
Fuel lines clogged	Remove restriction
Hesitation	
Cracked or broken vacuum	Replace vacuum hoses hoses

CONDITION & POSSIBLE CAUSE	CORRECTION
Vacuum leaks	Repair Vacuum leaks
Binding carburetor linkage	Eliminate binding
Binding throttle linkage	Eliminate binding
Binding choke linkage or fast idle cam	Eliminate binding
Improper float setting	Readjust float setting, see FUEL
Cracked or broken ignition wires	Replace ignition wires
Rough Idle, Missing or Stalling	
Incorrect curb idle or fast idle speed	Reset idle speed, see see ENGINE PERFORMANCE
Incorrect basic timing	Reset ignition timing see ENGINE PERFORMANCE
Improper idle mixture adjustment	Reset idle mixture, see ENGINE PERFORMANCE
Improper feedback system operation	Check feedback system see ENGINE PERFORMANCE
Incorrect spark plug gap	Reset spark plug gap, see ENGINE PERFORMANCE
Moisture in ignition components	Dry components
Loose or broken ignition wires	Replace ignition wires
Damaged distributor cap or or rotor	Replace distributor cap or rotor
Faulty ignition coil	Replace ignition coil
Fuel filter clogged or worn	Replace fuel filter
Damaged idle mixture screw	Replace idle mixture screw, see FUEL
Improper fast idle cam adjustment	Reset fast idle cam adjustment, see TUNE- see ENGINE PERFORMANCE
Improper EGR valve operation	Replace EGR valve
Faulty PCV valve air flow	Replace PCV valve
Choke binding or improper choke setting	Reset choke or eliminate binding
Vacuum leak	Repair vacuum leak
Improper float bowl fuel level	Reset float adjustment, see FUEL
Clogged air bleed or idle passages	Clean carburetor passages, see FUEL
Clogged or worn air cleaner filter	Replace air filter
Faulty choke vacuum diaphragm	Replace diaphragm, see ENGINE PERFORMANCE
Exhaust manifold heat valve inoperative	Replace heat valve
Improper distributor spark advance	Check distributor operation
Leaking valves or valve components	Check and repair valvetrain
Improper carburetor mounting	Remove and remount carburetor
Excessive play in distributor shaft	Replace distributor
Loose or corroded wiring connections	Repair or replace as required
Engine Surges	
Improper PCV valve airflow	Replace PCV valve

CONDITION & POSSIBLE CAUSE	CORRECTION
Vacuum leaks	Repair vacuum leaks
Clogged air bleeds	Remove restriction
EGR valve malfunction	Replace EGR valve
Restricted air cleaner filter	Replace air filter
Cracked or broken vacuum hoses	Replace vacuum hoses
Cracked or broken ignition wires	Replace ignition wires
Vacuum advance malfunction	Check unit and replace as necessary
Defective or fouled spark plugs	Replace spark plugs
Ping or Spark Knock	
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Distributor centrifugal or vacuum advance malfunction	Check operation and replace as necessary
Carburetor setting too lean	Readjust mixture setting, see ENGINE PERFORMANCE
Vacuum leak	Eliminate vacuum leak
EGR valve malfunction	Replace EGR valve
Poor Gasoline Mileage	
Cracked or broken vacuum	Replace vacuum hoses hoses
Vacuum leaks	Repair vacuum leaks
Defective ignition wires	Replace wires
Incorrect choke setting	Readjust setting, see ENGINE PERFORMANCE
Defective vacuum advance	Replace vacuum advance
Defective spark plugs	Replace spark plugs
Binding carburetor power piston	Eliminate binding
Dirt in carburetor jets	Clean and/or replace jets
Incorrect float adjustment	Readjust float setting, see FUEL
Defective power valve	Replace power valve, see ENGINE PERFORMANCE
Incorrect idle speed	Readjust idle speed
Engine Stalls	
Improper float level	Readjust float level
Leaking needle valve and seat	Replace needle valve and seat
Vacuum leaks	Eliminate vacuum leaks

VACUUM PUMP - DIESEL TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

NOTE: **Diesel engines mechanical diagnosis is the same as gasoline engines for items such as noisy valves, bearings, pistons, etc. The following trouble shooting covers only items pertaining to diesel engines.**

VACUUM PUMP (DIESEL) TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Excessive Noise	
Loose pump-to-drive assembly screws	Tighten screws
Loose tube on pump assembly	Tighten tube
Valves not functioning properly	Replace valves
Oil Leakage	
Loose end plug	Tighten end plug
Bad seal crimp	Remove and re-crimp seal

MANUAL TRANSMISSION

MANUAL TRANSMISSION TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

MANUAL TRANSMISSION/TRANSAXLE TROUBLE SHOOTING

Condition	Possible Cause
Noisy In Forward Gears	Low gear oil level, Loose bell housing bolts, Worn bearings or gears
Clunk On Deceleration (FWD Only)	Loose engine mounts, Worn inboard CV joints, Worn differential pinion shaft, Side gear hub counterbore in case worn oversize
Gear Clash When Shifting Forward Gears	Clutch Out Of Adjustment, Shift linkage damaged or out of adjustment, Gears or synchronizers damaged, Low gear oil level
Transmission Noisy When Moving (RWD Only) Quiet In Neutral With Clutch Engaged	Worn rear outputshaft bearing
Gear Rattle	Worn bearings, Wrong gear oil, Low gear oil, Worn gears
Steady Ticking At Idle (Increases With RPM)	Broken tooth on gear
Gear Clash When Shifting Forward Gears	Worn or broken synchronizers
Loud Whine In Reverse	Normal condition (1)
Noise When Stepping On Clutch	Bad release bearing, Worn pilot bearing
Ticking Or Screeching As Clutch Is Engaged	Faulty release bearing, Uneven pressure plate fingers

Condition	Possible Cause
Click Or Snap When Clutch Is Engaged	Worn clutch fork, Worn or broken front bearing retainer
Transmission Shifts Hard	Clutch not releasing, Shift mechanism binding, Clutch installed backwards
Will Not Shift Into One Gear, Shifts Into All Others	Bent shift fork, Worn detent balls
Locked Into Gear, Cannot Shift	Clutch adjustment, Worn detent balls
Transmission Jumps Out Of Gear	Pilot bearing worn, Bent shift fork, Worn gear teeth or face, Excessive gear train end play, Worn synchronizers, Missing detent ball spring, Shift mechanism worn or out of adjustment, Engine or transmission mount bolts loose or out of adjustment, Transmission not aligned
Shift Lever Rattle	Worn shift lever or detents, Worn shift forks, Worn synchronizers sleeve
Shift Lever Hops Under Acceleration	Worn engine or transmission mounts
(1) Most units use spur cut gears in reverse and are noisy	

POWERTRAIN

CLUTCH TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

BASIC CLUTCH TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Chattering or Grabbing	
Incorrect clutch adjustment	Adjust clutch
Oil, grease or glaze on facings	Disassemble and clean or replace
Loose "U" joint flange	See DRIVE AXLES article
Worn input shaft spline	Replace input shaft
Binding pressure plate	Replace pressure plate
Binding release lever	See CLUTCH article
Binding clutch disc hub	Replace clutch disc
Unequal pressure plate contact	Replace worn/misaligned components
Loose/bent clutch disc	Replace clutch disc
Incorrect transmission alignment	Realign transmission
Worn pressure plate, disc or flywheel	Replace damaged components
Broken or weak pressure springs	Replace pressure plate
Sticking clutch pedal	Lubricate clutch pedal & linkage

CONDITION & POSSIBLE CAUSE	CORRECTION
Incorrect clutch disc facing	Replace clutch disc
Engine loose in chassis	Tighten all mounting bolts
Failure to Release	
Oil or grease on clutch facings	Clean or replace clutch clutch disc
Incorrect release lever or pedal adjustment	See CLUTCH article
Worn or broken clutch facings	Replace clutch disc
Bent clutch disc or pressure plate	Replace damaged components
Clutch disc hub binding on input shaft	Clean or replace clutch disc and/or input shaft
Binding pilot bearing	Replace pilot bearing
Sticking release bearing sleeve	Replace release bearing and/or sleeve
Binding clutch cable	See CLUTCH article
Defective clutch master	Replace master cylinder
Defective clutch slave	Replace slave cylinder
Air in hydraulic system	Bleed hydraulic system
Rattling	
Weak or broken release lever spring	Replace spring and check alignment
Damaged pressure plate	Replace pressure plate
Broken clutch return spring	Replace return spring
Worn splines on clutch disc or input shaft	Replace clutch disc and/or input shaft
Worn clutch release bearing	Replace release bearing
Dry or worn pilot bearing	Lubricate or replace pilot bearing
Unequal release lever contact	Align or replace release lever
Incorrect pedal free play	Adjust free play
Warped or damaged clutch disc	Replace damaged components
Slipping	
Pressure springs worn or	Release pressure plate
Oily, greasy or worn facings	Clean or replace clutch disc
Incorrect clutch alignment	Realign clutch assembly
Warped clutch disc or pressure plate	Replace damaged components
Binding release levers or clutch pedal	Lubricate and/or replace release components
Squeaking	
Worn or damaged release	Replace release bearing
Dry or worn pilot or release bearing	Lubricate or replace assembly
Pilot bearing turning in crankshaft	Replace pilot bearing and/or crankshaft
Worn input shaft bearing	Replace bearing and seal
Incorrect transmission alignment	Realign transmission
Dry release fork between pivot	Lubricate release fork and pivot
Heavy and/or Stiff Pedal	
Sticking release bearing sleeve	Replace release bearing and/or sleeve
Dry or binding clutch pedal hub	Lubricate and align components
Floor mat interference with pedal	Lay mat flat in proper area

CONDITION & POSSIBLE CAUSE	CORRECTION
Dry or binding ball/fork pivots	Lubricate and align components
Faulty clutch cable	Replace clutch cable
Noisy Clutch Pedal	
Faulty interlock switch	Replace interlock switch
Self-adjuster ratchet noise	Lubricate or replace self-adjuster
Speed control interlock switch	Lubricate or replace interlock switch
Clutch Pedal Sticks Down	
Binding clutch cable	See CLUTCH article
Springs weak in pressure plate	Replace pressure plate
Binding in clutch linkage	Lubricate and free linkage
Noisy	
Dry release bearing	Lubricate or replace release bearing
Dry or worn pilot bearing	Lubricate or replace bearing
Worn input shaft bearing	Replace bearing
Transmission Click	
Weak springs in pressure	Replace pressure plate plate
Release fork loose on ball stud	Replace release fork and/or ball stud
Oil on clutch disc damper	Replace clutch disc
Broken spring in slave cylinder	Replace slave cylinder

DRIVE AXLE - NOISE DIAGNOSIS

Unrelated Noises

Some driveline trouble symptoms are also common to the engine, transmission, wheel bearings, tires, and other parts of the vehicle. Ensure cause of trouble actually is in the drive axle before adjusting, repairing, or replacing any of its parts.

Non-Drive Axle Noises

A few conditions can sound just like drive axle noise and have to be considered in pre-diagnosis. The 4 most common noises are exhaust, tires, CV/universal joints and wheel trim rings.

In certain conditions, the pitch of the exhaust gases may e gear whine. At other times, it may be mistaken for a wheel bearing rumble.

Tires, especially radial and snow, can have a high-pitched tread whine or roar, similar to gear noise. Also, some non-standard tires with an unusual tread construction may emit a roar or whine.

Defective CV/universal joints may cause clicking noises or excessive driveline play that can be improperly diagnosed as drive axle problems.

Trim and moldings also can cause a whistling or whining noise. Ensure none of these components are causing the noise before disassembling the drive axle.

Gear Noise

A "howling" or "whining" noise from the ring and pinion gear can be caused by an improper gear pattern, gear damage, or improper bearing preload. It can occur at various speeds and driving conditions, or it can be continuous.

Before disassembling axle to diagnose and correct gear ke sure that tires, exhaust, and vehicle trim have been checked as possible causes.

Chuckle

This is a particular rattling noise that sounds like a stick against the spokes of a spinning bicycle wheel. It occurs while decelerating from 40 MPH and usually can be heard until vehicle comes to a complete stop. The frequency varies with the speed of the vehicle.

A chuckle that occurs on the driving phase is usually caused ive clearance due to differential gear wear, or by a damaged tooth on the coast side of the pinion or ring gear. Even a very small tooth nick or a ridge on the edge of a gear tooth is enough the cause the noise.

This condition can be corrected simply by cleaning the gear tooth nick or ridge with a small grinding wheel. If either gear is damaged or scored badly, the gear set must be replaced. If metal has broken loose, the carrier and housing must be cleaned to remove particles that could cause damage.

Knock

This is very similar to a chuckle, though it may be louder, and occur on acceleration or deceleration. Knock can be caused by a gear tooth that is damaged on the drive side of the ring and pinion gears. Ring gear bolts that are hitting the carrier casting can cause knock. Knock can also be due to excessive end play in the axle shafts.

Clunk

Clunk is a metallic noise heard when an automatic transmission is engaged in Reverse or Drive, or when throttle is applied or released. It is caused by backlash somewhere in the driveline, but not necessarily in the axle. To determine whether driveline clunk is caused by the axle, check the total axle backlash as follows:

1. Raise vehicle on a frame or twinpost hoist so that drive wheels are free. Clamp a bar between axle companion flange and a part of the frame or body so that flange cannot move.
2. On conventional drive axles, lock the left wheel to keep it from turning. On all models, turn the right wheel slowly until it is felt to be in Drive condition. Hold a chalk marker on side of tire about 12" from center of wheel. Turn wheel in the opposite direction until it is again felt to be in Drive condition.
3. Measure the length of the chalk mark, which is the total axle backlash. If backlash is one inch or less, drive axle is not the source of clunk noise.

Bearing Whine

Bearing whine is a high-pitched sound similar to a whistle. It is usually caused by malfunctioning pinion bearings. Pinion bearings operate at drive shaft speed. Roller wheel bearings may whine in a similar manner if they run completely dry of lubricant. Bearing noise will occur at all driving speeds. This distinguishes it from gear whine, which usually comes and goes as speed changes.

Bearing Rumble

Bearing rumble sounds like marbles being tumbled. It is usually caused by a malfunctioning wheel bearing. The

lower pitch is because the wheel bearing turns at only about 1/3 of drive shaft speed.

Chatter On Turns

This is a condition where the entire front or rear of vehicle vibrates when vehicle is moving. The vibration is plainly felt as well as heard. Extra differential thrust washers installed during axle repair can cause a condition of partial lock-up that creates this chatter.

Axle Shaft Noise

Axle shaft noise is similar to gear noise and pinion bearing whine. Axle shaft bearing noise will normally distinguish itself from gear noise by occurring in all driving modes (Drive, cruise, coast and float), and will persist with transmission in Neutral while vehicle is moving at problem speed.

If vehicle displays this noise condition, remove suspect parts, replace wheel seals and install a new set of bearings. Re-evaluate vehicle for noise before removing any internal components.

Vibration

Vibration is a high-frequency trembling, shaking or grinding condition (felt or heard) that may be constant or variable in level and can occur during the total operating speed range of the vehicle.

The types of vibrations that can be felt in the vehicle can d into 3 main groups:

- Vibrations of various unbalanced rotating parts of the vehicle.
- Resonance vibrations of the body and frame structures caused by rotating of unbalanced parts.
- Tip-in moans of resonance vibrations from stressed engine or exhaust system mounts or driveline flexing modes.

DRIVE AXLE - RWD TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing. For definitions of listed noises or sounds, see DRIVE AXLE - NOISE DIAGNOSIS under POWERTRAIN.**

DRIVE AXLE (RWD) TROUBLE SHOOTING

CONDITION & POSSIBLE CAUSE	CORRECTION
Knocking or Clunking	
Differential Side Gear Clearance	Check Clearance
Worn Pinion Shaft	Replace Pinion Shaft
Axle Shaft End Play	Check End Play
Missing Gear Teeth	Check Differential/Replace Gear
Wrong Axle Backlash	Check Backlash
Misaligned Driveline	Realign Driveline
Clinking During Engagement	

CONDITION & POSSIBLE CAUSE	CORRECTION
Side Gear Clearance	Check Clearance
Ring and Pinion Backlash	Check Backlash
Worn/Loose Pinion Shaft	Replace Shaft/Bearing
Bad "U" Joint	Replace "U" Joint
Sticking Slip Yoke	Lube Slip Yoke
Broken Rear Axle Mount	Replace Mount
Loose Drive Shaft Flange	Check Flange
Click/Chatter On Turns	
Differential Side Gear Clearance	Check Clearance
Wrong Turn On Plates [(1)]	Replace Clutch Plates
Wrong Differential Lubricant [(1)]	Change Lubricant
Knock Or Click	
Flat Spot on Rear Wheel Bearing	Replace Wheel Bearing
Low Vibration At All Speeds	
Faulty Wheel Bearing	Replace Wheel Bearing
Faulty "U" Joint	Replace "U" Joint
Faulty Drive Shaft	Balance Drive Shaft
Faulty Companion Flange	Replace Flange
Faulty Slip Yoke Flange	Replace Flange

(1) Limited slip differential only.

FWD AXLE SHAFTS & CV JOINTS TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

BASIC FWD AXLE SHAFTS & CV JOINTS TROUBLE SHOOTING CHART

CONDITION	POSSIBLE CAUSE
Grease Leaks	CV boot torn or cracked
Clicking Noise on Cornering	Damaged outer CV
Clunk Noise on Acceleration	Damaged inner CV
Vibration or Shudder on Acceleration	Sticking, damaged or worn CV Misalignment or spring height

STEERING & SUSPENSION

MANUAL STEERING GEAR TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble**

Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BASIC MANUAL STEERING GEAR TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Rattle or Chucking Noise in Rack and Pinion	
Rack and pinion mounting bracket loose	Tighten all mounting bolts
Lack of/or incorrect lubricant	Correct as necessary
Steering gear mounting bolts loose	Tighten all mounting bolts
Excessive Play	
Front wheel bearing improperly adjusted	See FRONT SUSPENSION article
Loose or worn steering linkage	See STEERING LINKAGE article
Loose or worn steering gear shift	See MANUAL STEERING GEAR article
Steering arm loose on gear shaft	See MANUAL STEERING GEAR article
Steering gear housing bolts loose	Tighten all mounting bolts
Steering gear adjustment too loose	See MANUAL STEERING GEAR article
Steering arms loose on knuckles	Tighten and check steering linkage
Rack and pinion mounting loose	Tighten all mounting bolts
Rack and pinion out of adjustment	See adjustment in STEERING article
Tie rod end loose	Tighten and check steering linkage
Excessive Pitman shaft-to-ball nut lash	Repair as necessary
Poor Returnability	
Lack of lubricant in ball joint or linkage	Lubricate and service systems
Binding in linkage or ball joints	See STEERING LINKAGE and SUSPENSION article
Improper front end alignment	See WHEEL ALIGNMENT article
Improper tire pressure	Inflate to proper pressure
Tie rod binding	Inflate to proper pressure
Shaft seal rubbing shaft	See STEERING COLUMN article
Excessive Vertical Motion	
Improper tire pressure	Inflate to proper pressure
Tires, wheels or rotors out of balance	Balance tires then check wheels and rotors
Worn or faulty shock absorbers	Check and replace if necessary
Loose tie rod ends or steering	Tighten or replace if necessary
Loose or worn wheel bearings	See SUSPENSION article
Steering Pulls to One Side	
Improper tire pressure	Inflate to proper pressure
Front tires are different sizes	Rotate or replace if necessary
Wheel bearings not adjusted properly	See FRONT SUSPENSION article
Bent or broken suspension components	See FRONT SUSPENSION article
Improper wheel alignment	See WHEEL ALIGNMENT article

CONDITION & POSSIBLE CAUSE	CORRECTION
Brakes dragging	See BRAKES article
Instability	
Low or uneven tire pressure	Inflate to proper pressure
Loose or worn wheel bearings	See FRONT SUSPENSION article
Loose or worn idler arm bushing	See FRONT SUSPENSION article
Loose or worn strut bushings	See FRONT SUSPENSION article
Incorrect front wheel alignment	See WHEEL ALIGNMENT article
Steering gear not centered	See MANUAL STEERING GEARS article
Springs or shock	Check and replace if necessary
Improper cross shaft	See MANUAL STEERING GEARS article

POWER STEERING TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

BASIC POWER STEERING TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Rattle or Chucking Noise	
Pressure hoses touching engine parts	Adjust to proper clearance
Loose Pitman shaft	Adjust or replace if necessary
Tie rods ends or Pitman arm loose	Tighten and check system
Rack and pinion mounts loose	Tighten all mounting bolts
Free play in worm gear	See POWER STEERING GEAR article
Loose sector shaft or thrust bearing adjustment	See POWER STEERING GEAR
Free play in pot coupling	See STEERING COLUMN article
Worn shaft serrations	See STEERING COLUMN article
Growl in Steering Pump	
Excessive pressure in hoses	Restricted hoses, see POWER STEERING GEAR article
Scored pressure plates	See POWER STEERING GEAR article
Scored thrust plates or rotor	See POWER STEERING GEAR article
Extreme wear of cam ring	See POWER STEERING GEAR article
Rattle in Steering Pump	
Vanes not installed	See POWER STEERING PUMP article
Vanes sticking in rotor	See POWER STEERING PUMP article
Swish noise in Pump	
Defective flow control valve	See POWER STEERING PUMP article
Groan in Steering Pump	

CONDITION & POSSIBLE CAUSE	CORRECTION
Air in fluid	See POWER STEERING PUMP article
Poor pressure hose connection	Tighten and check, replace if necessary
Squawk When Turning	
Damper "O" ring on valve spool cut	See POWER STEERING PUMP article
Moan or Whine in Pump	
Pump shaft bearing scored	Replace bearing and fluid
Air in fluid or fluid level low	See POWER STEERING PUMP article
Hose or column grounded	Check and replace if necessary
Cover "O" ring missing or damaged	See POWER STEERING PUMP article
Valve cover baffle missing or damaged	See POWER STEERING PUMP article
Interference of components in pump	See POWER STEERING PUMP article
Loose or poor bracket alignment	Correct or replace if necessary
Hissing When Parking	
Internal leakage in steering gear	Check valved assembly first
Chirp in Steering Pump	
Loose or worn power steering belt	Adjust or replace if necessary
Buzzing When Not Steering	
Noisy pump	See POWER STEERING PUMP article
Free play in steering shaft bearing	See STEERING COLUMN article
Bearing loose on shaft serrations	See STEERING COLUMN article
Clicking Noise in Pump	
Pump slippers too long	See POWER STEERING PUMP article
Broken slipper springs	See POWER STEERING PUMP article
Excessive wear or nicked rotors	See POWER STEERING PUMP article
Damaged cam contour	See POWER STEERING PUMP article
Poor Return of Wheel	
Wheel rubbing against turn signal	See STEERING COLUMN SWITCHES article
Flange rubbing steering gear adjuster	See STEERING COLUMN article
Tight or frozen steering shaft bearing	See STEERING COLUMN article
Steering gear out of adjustment	See POWER STEERING GEAR article
Sticking or plugged spool valve	See POWER STEERING PUMP article
Improper front end alignment	See WHEEL ALIGNMENT article
Wheel bearings worn or loose	See FRONT SUSPENSION article
Ties rods or ball joints binding	Check and replace if necessary
Intermediate shaft joints binding	See STEERING COLUMN article
Kinked pressure hoses	Correct or replace if necessary
Loose housing head spanner nut	See POWER STEERING GEAR article
Damaged valve lever	See POWER STEERING GEAR article
Sector shaft adjusted too tight	See ADJUSTMENTS in POWER STEERING GEAR article

CONDITION & POSSIBLE CAUSE	CORRECTION
Worm thrust bearing adjusted too tight	See ADJUSTMENTS in POWER STEERING GEAR article
Reaction ring sticking in cylinder	See POWER STEERING GEAR article
Reaction ring sticking in housing head	See POWER STEERING GEAR article
Steering pump internal leakage	See POWER STEERING PUMP article
Steering gear-to-column misalignment	See STEERING COLUMN article
Lack of lubrication in linkage	Service front suspension
Lack of lubrication in ball joints	Service front suspension
Increased Effort When Turning Wheel Fast Foaming, Milky Power Steering Fluid, Low Fluid Level or Low Pressure	
High internal pump leakage	See POWER STEERING PUMP article
Power steering pump belt slipping	Adjust or replace if necessary
Low fluid level	Check and fill to proper level
Engine idle speed to low	Adjust to correct setting
Air in pump fluid system	See POWER STEERING PUMP article
Pump output low	See POWER STEERING PUMP article
Steering gear malfunctioning	See POWER STEERING GEAR article
Wheel Surges or Jerks	
Low fluid level	Check and fill to proper level
Loose fan belt	Adjust or replace if necessary
Insufficient pump pressure	See POWER STEERING PUMP article
Sticky flow control valve	See POWER STEERING PUMP article
Linkage hitting oil pan at full turn	Replace bent components
Kick Back or Free Play	
Air in pump fluid system	See POWER STEERING PUMP article
Worn poppet valve in steering gear	See POWER STEERING PUMP article
Excessive over center lash	See POWER STEERING GEAR article
Thrust bearing out of adjustment	See POWER STEERING GEAR article
Free play in pot coupling	See POWER STEERING PUMP article
Steering gear coupling loose on shaft	See POWER STEERING PUMP article
Steering disc mounting bolts loose	Tighten or replace if necessary
Coupling loose on worm shaft	Tighten or replace if necessary
Improper sector shaft adjustment	See POWER STEERING GEAR article
Excessive worm piston side play	See POWER STEERING GEAR article
Damaged valve lever	See POWER STEERING GEAR article
Universal joint loose	Tighten or replace if necessary
Defective rotary valve	See POWER STEERING GEAR article
No Power When Parking	
Sticking flow control valve	See POWER STEERING PUMP article
Insufficient pump pressure output	See POWER STEERING PUMP article
Excessive internal pump leakage	See POWER STEERING PUMP article

CONDITION & POSSIBLE CAUSE	CORRECTION
Excessive internal gear leakage	See POWER STEERING PUMP article
Flange rubs against gear adjust plug	See STEERING COLUMN article
Loose pump belt	Adjust or replace if necessary
Low fluid level	Check and add proper amount of fluid
Engine idle too low	Adjust to correct setting
Steering gear-to-column misaligned	See STEERING COLUMN article
No Power, Left Turn	
Left turn reaction seal "O" ring worn	See POWER STEERING GEAR article
Left turn reaction seal damaged/missing	See POWER STEERING GEAR article
Cylinder head "O" ring damaged	See POWER STEERING PUMP article
No Power, Right Turns	
Column pot coupling bottomed	See STEERING COLUMN article
Right turn reaction seal "O" ring worn	See POWER STEERING GEAR article
Right turn reaction seal damaged	See POWER STEERING GEAR article
Internal leakage through piston end plug	See POWER STEERING GEAR article
Internal leakage through side plugs	See POWER STEERING GEAR article
Lack of Effort in Turning	
Left and/or right reaction seal sticking in cylinder head	Replace, see POWER STEERING GEAR article
Wanders to One Side	
Front end alignment incorrect	See WHEEL ALIGNMENT article
Unbalanced steering gear valve	See POWER STEERING GEAR article
Low Pressure Due to Steering Pump	
Flow control valve stuck or inoperative	See POWER STEERING PUMP article
Pressure plate not flat against cam ring	See POWER STEERING PUMP article
Extreme wear of cam ring	Replace and check adjustments
Scored plate, thrust plate or rotor	See POWER STEERING PUMP article
Vanes not installed properly	See POWER STEERING PUMP article
Vanes sticking in rotor slots	See POWER STEERING PUMP article
Cracked/broken thrust or pressure plate	See POWER STEERING PUMP article

STEERING COLUMN TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

BASIC STEERING COLUMN TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Noise in Steering	

CONDITION & POSSIBLE CAUSE	CORRECTION
Coupling pulled apart	See STEERING COLUMNS article
Column not correctly aligned	See STEERING COLUMNS article
Broken lower joint	Replace joint
Horn contact ring not	See STEERING COLUMN article
Bearing not lubricated	See STEERING COLUMN article
Shaft snap ring not properly seated	Reseat or replace snap ring
Plastic spherical joint not lubricated	See STEERING COLUMN article
Shroud or housing loose	Tighten holding screws
Lock plate retaining ring not seated	See STEERING COLUMN article
Loose sight shield	Tighten holding screws
High Steering Shaft Effort	
Column assembly misaligned	See STEERING COLUMN article
Improperly installed dust shield	Adjust or replace
Tight steering universal joint	See STEERING COLUMN article
High Shift Effort	
Column is out of alignment	See STEERING COLUMN article
Improperly installed dust shield	Adjust or replace
Seals or bearings not lubricated	See STEERING COLUMNS article
Mounting bracket screws too long	Replace with new shorter screws
Burrs on shift tube	Remove burrs or replace tube
Lower bowl bearing assembled wrong	See STEERING COLUMN article
Shift tube bent or broken	Replace as necessary
Improper adjustment of shift levers	See STEERING COLUMN article
Improper Trans. Shifting	
Sheared shift tube joint	Replace as necessary
Sheared lower shaft lever	Replace as necessary
Improper shift lever adjustment	See STEERING COLUMN article
Improper gate plate adjustment	See STEERING COLUMN article
Excess Play in Column	
Instrument panel bracket bolts loose	Tighten bolts and check bracket
Broken weld nut on jacket	See STEERING COLUMN article
Instrument bracket capsule sheared	See STEERING COLUMN article
Column bracket/jacket bolts loose	Tighten bolts and check bracket
Steering Locks in Gear	
Release lever mechanism	See STEERING COLUMN article

SUSPENSION TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT,**

DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BASIC SUSPENSION TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Front End Noise	
Loose or worn wheel	See Wheel Bearing Adjustment in SUSPENSION
Worn shocks or shock mountings	Replace struts or strut mountings
Worn struts or strut mountings	Replace struts or strut mountings
Loose or worn lower control arm	See SUSPENSION
Loose steering gear-to-frame bolts	See STEERING
Worn control arm bushings	See SUSPENSION
Ball joints not lubricated	Lubricate ball joints & see Ball Joint Checking in SUSPENSION
Front Wheel Shake, Shimmy, or Vibration	
Tires or wheels out of balance	Check tire balance
Incorrect wheel alignment	See WHEEL ALIGNMENT
Drive shaft unbalanced	Check drive shaft balance
Loose or worn wheel bearings	See WHEEL ALIGNMENT
Loose or worn tie rod ends	See SUSPENSION
Worn upper ball joints	See Ball Joint Checking in SUSPENSION
Worn shock absorbers	Replace shock absorbers
Worn strut bushings	Replace strut bushings
Car Pulls to One Side	
Mismatched or uneven tires	Check tire condition
Broken or sagging springs	See SUSPENSION
Loose or worn strut bushings	See SUSPENSION
Improper wheel alignment	See WHEEL ALIGNMENT
Improper rear axle alignment	Check rear axle alignment
Power steering gear unbalanced	See STEERING
Front brakes dragging	See BRAKES
Abnormal Tire Wear	
Unbalanced tires	Check tire balance & rotation
Sagging or broken springs	See SUSPENSION
Incorrect front end alignment	See WHEEL ALIGNMENT
Faulty shock absorbers	Replace chock absorbers
Scuffed Tires	
Toe-In incorrect	See WHEEL ALIGNMENT
Suspension arm bent or twisted	See appropriate SUSPENSION article
Springs Bottom or Sag	
Bent or broken springs	See SUSPENSION
Leaking or worn shock absorbers	Replace shock absorbers

CONDITION & POSSIBLE CAUSE	CORRECTION
Frame misalignment	Check frame for damage
Spring Noises	
Loose "U" Bolts	See SUSPENSION
Loose or worn bushings	See SUSPENSION
Worn or missing interliners	See SUSPENSION
Shock Absorber Noise	
Loose shock mountings	Check & tighten mountings
Worn bushings	Replace bushings
Air in system	Bleed air from system
Undercoating on shocks	Remove undercoating
Car Leans or Sways on Corners	
Loose stabilizer bar	See SUSPENSION
Faulty shocks or mountings	Replace shocks or mountings
Broken or sagging springs	See SUSPENSION
Shock Absorbers Leaking	
Worn seals or reservoir tube crimped	See SUSPENSION
Broken Springs	
Loose "U" bolts	See SUSPENSION
Inoperative shock absorbers	Replace shock absorbers

WHEEL ALIGNMENT TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

BASIC WHEEL ALIGNMENT TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Premature Tire Wear	
Improper tire inflation	Check tire pressure
Front alignment out of tolerance	See ALIGNMENT SPECS in WHEEL ALIGNMENT section
Suspension components worn	See SUSPENSION section
Steering system components worn	See STEERING section
Improper standing height	See WHEEL ALIGNMENT
Uneven or sagging springs	See SUSPENSION section
Bent wheel	See WHEEL ALIGNMENT
Improper torsion bar adjustment	See SUSPENSION section
Loose or worn wheel bearings	See WHEEL BEARING ADJ. in SUSPENSION section

CONDITION & POSSIBLE CAUSE	CORRECTION
Worn or defective shock	Replace shock absorbers
Tires out of balance	Check tire balance
Pulls to One Side	
Improper tire inflation	Check tire pressure
Brake dragging	See BRAKE section
Mismatched tires	See WHEEL ALIGNMENT
Broken or sagging spring	See SUSPENSION section
Broken torsion bar	See SUSPENSION section
Power steering valve not centered	See STEERING section
Front alignment out of tolerance	See WHEEL ALIGNMENT section
Defective wheel bearing	See WHEEL BEARINGS in SUSPENSION section
Uneven sway bar links	See SUSPENSION section
Frame bent	Check for frame damage
Steering system bushing worn	See STEERING section
Hard Steering	
Idler arm bushing too tight	See STEERING LINKAGE in STEERING section
Ball joint tight or seized	See SUSPENSION section
Steering linkage too tight	See STEERING LINKAGE in STEERING section
Power steering fluid low	Add proper amount of fluid
Power steering drive belt loose	See STEERING section
Power steering pump defective	See STEERING section
Steering gear out of adjustment	See STEERING section
Incorrect wheel alignment	See WHEEL ALIGNMENT
Damaged steering gear	See STEERING section
Damaged suspension	See SUSPENSION section
Bent steering knuckle or supports	See SUSPENSION section
Vehicle "Wanders"	
Strut rod or control arm bushing worn	See SUSPENSION section
Loose or worn wheel bearings	See WHEEL BEARINGS in SUSPENSION section
Improper tire inflation	Check tire pressure
Stabilizer bar missing or defective	See SUSPENSION section
Wheel alignment out of tolerance	See Adjustment in WHEEL ALIGNMENT section
Broken spring	See SUSPENSION section
Defective shock absorber	Replace shock absorbers
Worn steering & suspension components	See SUSPENSION section
Front End Shimmy	

CONDITION & POSSIBLE CAUSE	CORRECTION
Tire out of balance/round	Check tire balance
Excessive wheel runout	See WHEEL ALIGNMENT
Insufficient or improper caster	See WHEEL ALIGNMENT section
Worn suspension or steering components	See SUSPENSION section
Defective shock absorbers	Replace shock absorber
Wheel bearings worn or loose	See WHEEL BEARING ADJ. in SUSPENSION section
Power steering reaction Bracket loose	See STEERING section
Steering gear box (rack) mounting loose	See STEERING section
Steering gear adjustment loose	See STEERING section
Worn spherical joints	See SUSPENSION section
Toe-In Not Adjustable	
Lower control arm bent	See SUSPENSION section
Frame bent	Check frame for damage
Camber Not Adjustable	
Control arm bent	See SUSPENSION section
Frame bent	Check frame for damage
Hub & bearing not seated properly	See SUSPENSION section

2015-16 ACCESSORIES AND EQUIPMENT

Universal Transmitter - Challenger

DESCRIPTION

DESCRIPTION

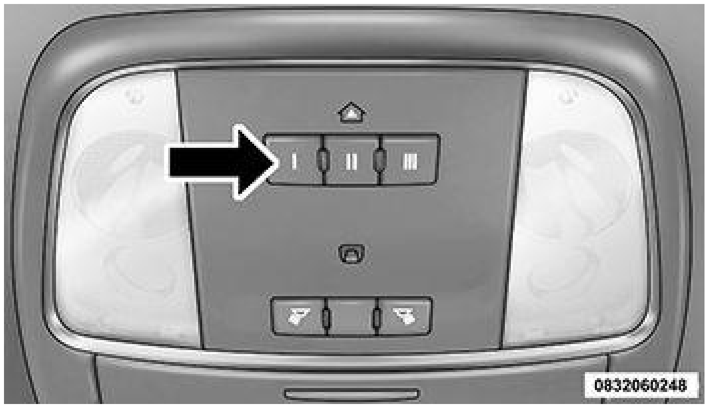

Fig. 1: Universal Transmitter Push Buttons
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the optional universal transmitter (also known as the HomeLinkÃ® transmitter or Universal Garage Door Opener/UGDO) have a universal transmitter switch pod integral to the overhead console located in the headliner just behind the windshield opening header. The switch buttons are centered between the two map/reading lamps, forward of the sunglasses storage bin and, if equipped, the power sunroof switch. This switch has three momentary push buttons clearly marked by the Roman numerals I, II and III for identification of each of the three transmitter channels. The switch push buttons have instrument panel dimmer controlled LED units that provide back lighting for visibility at night.

Each of the three universal transmitter push buttons controls an independent radio transmitter channel. Each of these three channels can be trained to transmit a different Radio Frequency (RF) signal for the remote operation of garage door openers, motorized gate openers, home or office lighting, security systems or most any other device equipped with a RF receiver operating in the 286 to 440 and 902 to 927 MegaHertz (MHz) frequency ranges. The transmitter is capable of operating systems using either rolling code or non-rolling code security technology.

The universal transmitter switch pod cannot be repaired and is only serviced as a unit with the overhead console. If the transmitter or any of the switches are ineffective or damaged, the entire overhead console unit must be replaced.

OPERATION

OPERATION

The universal transmitter (also known as the HomeLinkÃ® transmitter or Universal Garage Door Opener/UGDO) operates on a fused battery feed so the unit will remain functional, regardless of the ignition switch position. The transceiver has a security ground and will become disabled any time the vehicle security

alarm is armed. For more information on the features, programming procedures and operation of the HomeLinkÂ® transceiver, see the owner's manual.

The hard wired input circuits for the universal transmitter may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The RF signal strength of the universal transmitter may also be tested. Refer to DIAGNOSIS AND TESTING.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HOMELINKÂ® TRANSCEIVER

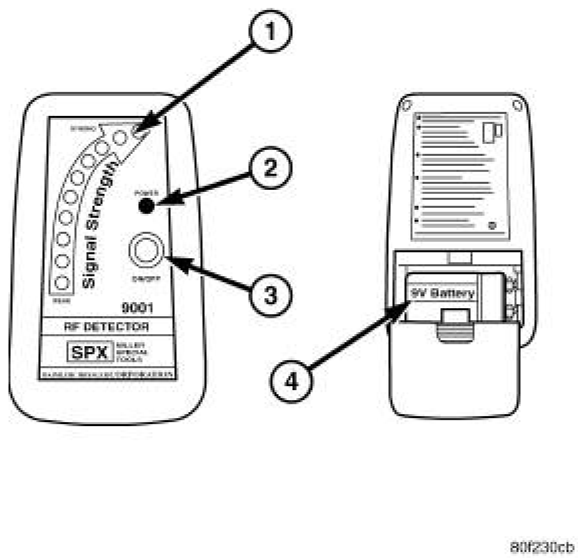

Fig. 2: Identifying Radio Frequency Detector
Courtesy of CHRYSLER GROUP, LLC

If the universal transmitter (also known as the HomeLinkÂ® transmitter or Universal Garage Door Opener/UGDO) is inoperative, retrain the transmitter using a known good transmitter containing a known good battery. Refer to STANDARD PROCEDURE. Test the universal transmitter operation again. If the unit is still inoperative, test the universal transmitter with a Radio Frequency Detector special tool as follows:

1. Turn On the Radio Frequency (RF) detector special tool by depressing the ON/OFF button (3). An audible **chirp** will sound and the green Power indicator (2) will illuminate. If the Power indicator does not illuminate, replace the RF detector battery (4).
2. Hold the RF detector within 2.54 centimeters (1 inch) of the **trained** universal transmitter, then depress any one of the three universal transmitter channel push buttons.
3. The red Signal Strength Light Emitting Diode (LED) units (1) will illuminate and the tool will generate an audible **beep** if a radio signal is detected. Repeat this test for all three universal transmitter channel push buttons. If the tool does not detect a radio signal for any of the three push buttons, replace the ineffective universal transmitter unit. Refer to CONSOLE, OVERHEAD, FRONT, REMOVAL .

STANDARD PROCEDURE

ERASING HOMELINKĀ® TRANSCEIVER CODES

NOTE: **Individual channels cannot be erased. Erasing the HomeLinkĀ® transceiver codes will erase ALL programmed codes.**

To erase programming from all three buttons (individual buttons cannot be erased but can be reprogrammed), press and hold the two outer HomeLinkĀ® transceiver buttons until the indicator light begins to flash after about 20 seconds. Release both buttons. Do not hold for longer that 30 seconds. HomeLinkĀ® is now in the train (or learning) mode and can be programmed at any time beginning with Programming. Refer to PROGRAMMING HOMELINKĀ® TRANSCEIVER CODES .

PROGRAMMING HOMELINKĀ® TRANSCEIVER CODES

WARNING: **Vehicle exhaust contains carbon monoxide, a dangerous gas. Do not run the engine while training the universal transmitter. Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **Your motorized door or gate may open and close while you are training the universal transmitter if the vehicle is in range of the motorized device. Do not train the universal transmitter if people or pets are in the path of the door or gate. A moving door or gate can cause serious injury or death to people and pets or damage to objects.**

NOTE: **When programming a garage door opener, it is advised to park outside the garage. It is also recommended that a new battery be placed in the hand-held transmitter of the device being programmed to the HomeLinkĀ® transceiver for quicker training and accurate transmission of the radio-frequency signal.**

NOTE: **If programing the HomeLinkĀ® transceiver is unsuccessful using the following procedure, refer to the Owner's Manual for the current customer assistance phone number.**

1. Press and hold the two outer HomeLinkĀ® transceiver buttons, and release only when the indicator light begins to flash (after 20 seconds). **Do not** hold the buttons for longer than 30 seconds and **do not** repeat step one to program a second and/or third hand-held transmitter to the remaining two HomeLinkĀ® transceiver buttons.
2. Position the end of your hand-held transmitter 3-8 cm (1-3 inches) away from the HomeLinkĀ® transceiver buttons while keeping the indicator light in view.
3. Simultaneously press and hold both the HomeLinkĀ® transceiver button that you want to train and the hand-held transmitter button. **Do not release the buttons until step 4 has been completed.**

   NOTE: **Some gate operators and garage door openers may require you to replace this Programming Step 3 with procedures noted in the "Gate Operator/Canadian Programming". Refer to CANADIAN PROGRAMMING/GATE PROGRAMMING.**

4. The HomeLinkĀ® transceiver indicator light will flash slowly and then rapidly after HomeLinkĀ® successfully receives the frequency signal from the hand-held transmitter. Release both buttons after the

indicator light changes from the slow to rapid flash.

5. Press and hold the just trained HomeLinkÂ® transceiver button and observe the indicator light. If the indicator light **stays on constantly, programming is complete** and your device should activate when the button is pressed and released.

> **NOTE:** **To program the remaining two buttons, begin with "Programming" step 2. Do not repeat step 1.**
>
> **If the indicator light blinks rapidly for two seconds and then turns to a constant light, continue with "Programming" steps 6-8 to complete the programming of a rolling code equipped device (most commonly a garage door opener).**

6. At the garage door opener receiver (motor-head unit) in the garage, locate the "learn" or "smart" button. This can usually be found where the hanging antenna wire is attached to the motor-head unit.
7. Firmly press and release the "learn" or "smart" button. (The name and color of the button may vary by manufacturer.)

> **NOTE:** **There are 30 seconds in which to initiate step 8.**

8. Return to the vehicle and firmly **press, hold for two seconds and release** the programmed HomeLinkÂ® transceiver button. Repeat the **"press/hold/release"** sequence a second time, and, depending on the brand of the garage door opener (or other rolling code equipped device), repeat this sequence a third time to complete the programming.

   The HomeLinkÂ® transceiver should now activate your rolling code equipped device.

NOTE: **To program the remaining two HomeLinkÂ® transceiver buttons, begin with "Programming" step 2. Do not repeat step 1.**

CANADIAN PROGRAMMING/GATE PROGRAMMING

Canadian radio-frequency laws require transmitter signals to "time-out" (or quit) after several seconds of transmission which may not be long enough for the HomeLinkÂ® transceiver to pick up the signal during programming. Similar to this Canadian law, some U.S. gate operators are designed to "time-out" in the same manner.

If you live in Canada or you are having difficulties programming a gate operator by using the "Programming" procedures (regardless of where you live), **replace "Programming HomeLinkÂ® Transceiver Codes" step 3** with the following:

NOTE: **When programming a garage door opener or gate operator, it is advised to unplug the device or move the vehicle out of range during the "cycling" process to prevent possible overheating.**

3. Continue to press and hold the HomeLinkÂ® transceiver button while you **press and release every two seconds** ("cycle") your hand-held transmitter until the frequency signal has successfully been accepted. The indicator light will flash slowly and then rapidly. Proceed with "Programming" step 4 to complete.

REPROGRAMMING HOMELINKĀ® TRANSCEIVER CODES

WARNING: **Vehicle exhaust contains carbon monoxide, a dangerous gas. Do not run the engine while training the universal transmitter. Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **Your motorized door or gate may open and close while you are training the HomeLinkĀ® transceiver if the vehicle is in range of the motorized device. Do not train the HomeLinkĀ® transceiver if people or pets are in the path of the door or gate. A moving door or gate can cause serious injury or death to people and pets or damage to objects.**

NOTE: **If programing the HomeLinkĀ® transceiver is unsuccessful using the following procedure, refer to the Owner's Manual for the current customer assistance phone number.**

REPROGRAMMING COMMON UNIVERSAL TRANSMITTER CODES

To program a device to the HomeLinkĀ® transceiver using a button previously trained, follow these steps:

1. Press and hold the desired HomeLinkĀ® transceiver button. **DO NOT** release the button. The indicator light will begin to flash after 20 seconds. Without releasing the HomeLinkĀ® transceiver button, proceed to step 2.
2. Position the end of your hand-held transmitter 3-8 cm (1-3 inches) away from the HomeLinkĀ® transceiver button while keeping the indicator light in view.
3. Simultaneously press and hold both the HomeLinkĀ® transceiver button that you want to train and the hand-held transmitter buttons. **Do not release the buttons until step 4 has been completed.**

   NOTE: **Some gate operators and garage door openers may require you to replace this Reprogramming Step 3 with procedures noted in the "Gate Operator/Canadian Programming". Refer to** **CANADIAN PROGRAMMING/GATE PROGRAMMING****.**

4. The HomeLinkĀ® transceiver indicator light will flash slowly and then rapidly after it successfully receives the frequency signal from the hand-held transmitter. Release both buttons after the indicator light changes from the slow to the rapid flash.
5. Press and hold the just trained HomeLinkĀ® transceiver button and observe the indicator light. If the indicator light **stays on constantly, reprogramming is complete** and your device should activate when the button is pressed and released.

   NOTE: **If the indicator light blinks rapidly for two seconds and then turns to a constant light, continue with "Reprogramming" steps 6-8 to complete the programming of a rolling code equipped device (most commonly a garage door opener).**

6. At the garage door opener receiver (motor-head unit) in the garage, locate the "learn" or "smart" button. This can usually be found where the hanging antenna wire is attached to the motor-head unit.
7. Firmly press and release the "learn" or "smart" button. (The name and color of the button may vary by

manufacturer.)

NOTE: **There are 30 seconds in which to initiate step 8.**

8. Return to the vehicle and firmly **press, hold for two seconds and release** the reprogrammed HomeLinkÂ® transceiver button. Repeat the **"press/hold/release"** sequence a second time, and, depending on the brand of the garage door opener (or other rolling code equipped device), repeat this sequence a third time to complete the reprogramming.

   The HomeLinkÂ® transceiver should now activate your rolling code equipped device.

CANADIAN PROGRAMMING/GATE PROGRAMMING

Canadian radio-frequency laws require transmitter signals to "time-out" (or quit) after several seconds of transmission which may not be long enough for the HomeLinkÂ® transceiver to pick up the signal during programming. Similar to this Canadian law, some U.S. gate operators are designed to "time-out" in the same manner.

If you live in Canada or you are having difficulties programming a gate operator by using the "Programming" procedures (regardless of where you live), **replace "Reprogramming HomeLinkÂ® Transceiver Codes" step 3** with the following:

NOTE: **When programming a garage door opener or gate operator, it is advised to unplug the device or move the vehicle out of range during the "cycling" process to prevent possible overheating.**

3. Continue to press and hold the HomeLinkÂ® transceiver button while you **press and release every two seconds** ("cycle") your hand-held transmitter until the frequency signal has successfully been accepted. The indicator light will flash slowly and then rapidly. Proceed with "Programming" step 4 to complete.

ENGINE COMPARTMENT

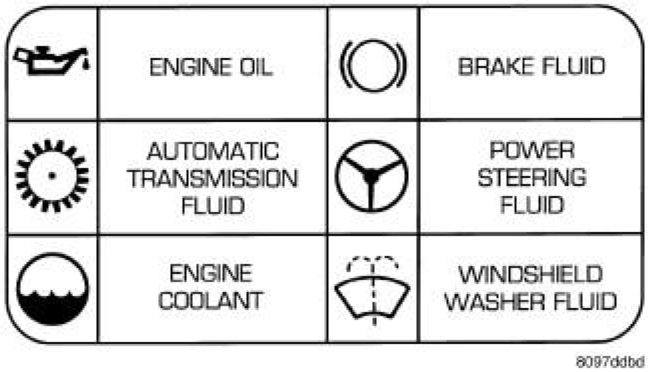

Fig. 4: International Symbols
Courtesy of CHRYSLER GROUP, LLC

The graphic symbols illustrated are used to identify engine compartment lubricant and fluid inspection and fill locations. The symbols correspond to the caps located within the engine compartment.

LABEL, VEHICLE EMISSION CERTIFICATION INFORMATION (VECI)

DESCRIPTION

DESCRIPTION

NOTE: **The Vehicle Emission Control Information (VECI) label(s) must be in place for the life of the vehicle. When replacing the component in which the VECI label is adhered, a new VECI label must also be adhered to the new component.**

All models have a VECI Label. Chrysler permanently attaches the label in the engine compartment. It cannot be removed without defacing information and destroying the label.

The label contains the vehicle's emission specifications and vacuum hose routings. All hoses must be connected and routed according to the label.

VEHICLE CERTIFICATION LABEL

DESCRIPTION

DESCRIPTION

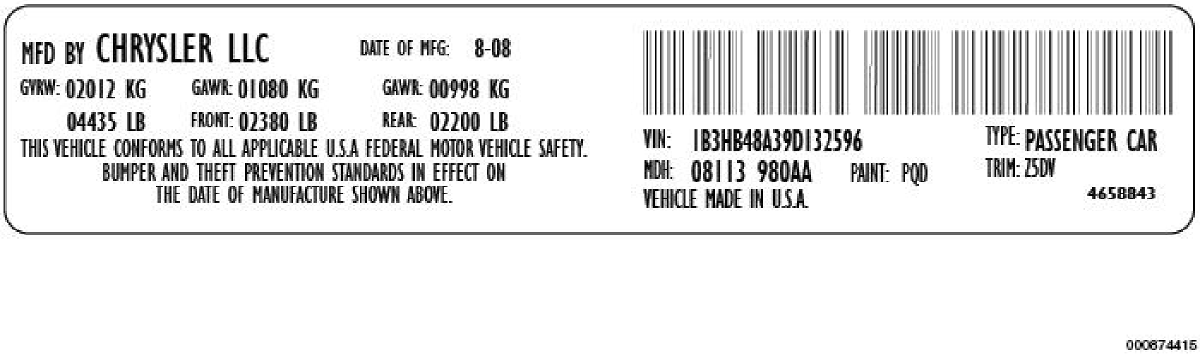

Fig. 5: Vehicle Certification Label - Typical
Courtesy of CHRYSLER GROUP, LLC

A vehicle certification label is attached to every Chrysler LLC vehicle. The label certifies that the vehicle conforms to all applicable Federal Motor Vehicle Standards. The label also lists:

- Month and year of vehicle manufacture.
- Gross Vehicle Weight Rating (GVWR). The gross front and rear axle weight ratings (GAWR's) are based on a minimum rim size and maximum cold tire inflation pressure.
- Vehicle Identification Number (VIN).
- Type of vehicle.
- Type of rear wheels.
- Bar code.
- Month, Day and Hour (MDH) of final assembly.
- Paint and Trim codes.
- Country of origin.

The label is located on the driver-side door shut-face.

VEHICLE IDENTIFICATION NUMBER

DESCRIPTION

DESCRIPTION

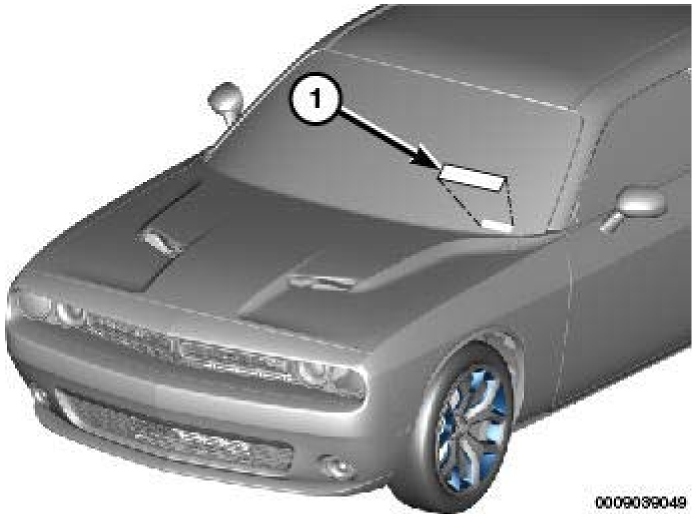

Fig. 6: Vehicle Identification Number (VIN) Label
Courtesy of CHRYSLER GROUP, LLC

The Vehicle Identification Number (VIN) label (1) can be viewed through the windshield at the upper left corner of the instrument panel, near the left windshield pillar. The VIN consists of 17 characters in a combination of letters and numbers that provide specific information about the vehicle. Refer to the charts below for decoding information.

To protect the consumer from theft and possible fraud the manufacturer is required to include a Check Digit at the ninth position of the vehicle identification number. The check digit is used by the manufacturer and government agencies to verify the authenticity of the vehicle and official documentation. The formula to use the check digit is not released to the general public.

POSITIONS 1 - 3: WORLD MANUFACTURER IDENTIFIER

1	2	3	Manufacturer	Vehicle Type
1	C	3	Chrysler Group LLC (USA)	Passenger Car
2	C	3	Chrysler Canada	Passenger Car

POSITION 4: RESTRAINT SYSTEM

NOTE:

- **All Seating Positions (ASP)**
- **Outboard Seating Position (OSP)**

Code	Description
C	Active Belts (ASP), Front Air Bags (OSP), With Side Inflatable Restraints - All Rows

POSITIONS 5 - 7:

Brand, marketing name, price series, code drive position, drive type, and body type.

5	6	7	Series	Drive Position	Drive Type	Body Type

5	6	7	Series	Drive Position	Drive Type	Body Type
D	Z	A	Base	Left Hand Drive	Rear Wheel Drive	2 Door Sedan
D	Z	B	Premium			
D	Z	C	SRT Supercharged			
D	Z	D	SRT Premium			
D	Z	F	SCAT Pack			

POSITION 8: ENGINE

Code	Displacement	Cylinders	Fuel	Turbo	Sales Codes
G	3.6 Liter	6	Gasoline	No	ERB
T	5.7 Liter	8	Gasoline	No	EZC, EZH
J	6.4 Liter	8	Gasoline	No	ESG; ESH
9	6.2 Liter Supercharged	8	Gasoline	No	ESD

POSITION 9: CHECK DIGIT

0 through 9 or X

POSITION 10: MODEL YEAR

F = 2015

POSITION 11: ASSEMBLY PLANT

Code	Plant
H	Brampton Assembly

POSITION 12 - 17: PLANT SEQUENCE NUMBER

A six digit number assigned by assembly plant.

2015-16 GENERAL INFORMATION

Vehicle Quick Reference - Challenger

CAPACITIES AND RECOMMENDED FLUIDS

DESCRIPTION

LUBRICANT RECOMMENDATIONS

SPECIALIZED LUBRICANTS AND OILS

Some maintenance or repair procedures may require the use of specialized lubricants or oils. Consult the appropriate Service Information for the correct application of these lubricants.

BODY

Component	Fluid, Lubricant, and Genuine Part	
Hinges: Door and Hood	MOPARĀ® Spray White Lube	Ā
Latches: Door, Hood/Safety Catch	MoparĀ® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB	
Seat Regulator and Track	MoparĀ® Buzz, Squeak, & Rattles Oil Lubricant	
Lock Cylinders	MoparĀ® Lock Cylinder Lube	

FLUID TYPES

When service is required, Chrysler recommends that only MoparĀ® brand parts, lubricants and chemicals be used. MoparĀ® provides the best engineered products for servicing Chrysler vehicles.

LUBRICANTS BEARING DESIGNATIONS

Only lubricants bearing designations defined by the following organization should be used to service a Chrysler vehicle:

- Society of Automotive Engineers (SAE)
- American Petroleum Institute (API)
- National Lubricating Grease Institute (NLGI)
- European Automobile Manufacturers Association (ACEA)

API QUALITY CLASSIFICATION

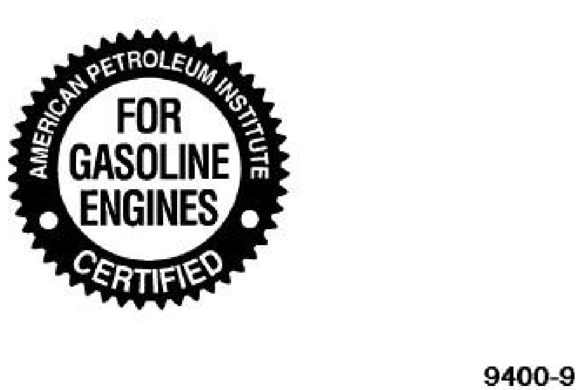

Fig. 1: API Symbol
Courtesy of CHRYSLER GROUP, LLC

This symbol on the front of an oil container means that the oil has been certified by the American Petroleum Institute (API) to meet all the lubrication requirements specified by Chrysler.

GEAR LUBRICANTS

SAE ratings also apply to multigrade gear lubricants. In addition, API classification defines the lubricant's usage, such as API GL-5 and SAE 75W-90.

AUTOMATIC TRANSMISSION FLUID

NOTE: **Refer to the appropriate Service Procedures in this Service Information for fluid level checking procedures.**

If equipped with a 8-Speed Automatic Transmission, use only MOPARĀ® ZF 8&9 Speed ATF™ Automatic Transmission Fluid, or equivalent. Failure to use the correct fluid may affect the function or performance of your transmission.

If equipped with a Manual Transmission, we recommend you use MOPARĀ® ATF+4Ā® Automatic Transmission Fluid.

FLUID ADDITIVES

Chrysler strongly recommends against the addition of any fluids to the transmission, other than those automatic transmission fluids listed above. Exceptions to this policy are the use of special dyes to aid in detecting fluid leaks.

Various "special" additives and supplements exist that claim to improve shift feel and/or quality. These additives and others also claim to improve converter clutch operation and inhibit overheating, oxidation, varnish, and sludge. These claims have not been supported to the satisfaction of Chrysler and these additives **must not be used.** The use of transmission "sealers" should also be avoided, since they may adversely affect the integrity of transmission seals.

ENGINE OIL

WARNING: **New or used engine oil can be irritating to the skin. Avoid prolonged or repeated skin contact with engine oil. Contaminants in used engine oil, caused by internal combustion, can be hazardous to your health. Thoroughly wash exposed skin with soap and water. Do not wash skin with gasoline, diesel fuel, thinner, or solvents, health problems can result. Do not pollute, dispose of used engine oil properly. Contact your dealer or government agency for location of collection center in your area.**

When service is required, Chrysler recommends that only MoparĀ® brand parts, lubricants and chemicals be used. MoparĀ® provides the best engineered products for servicing Chrysler vehicles.

LUBRICANTS BEARING DESIGNATIONS

Only lubricants bearing designations defined by the following organization should be used.

- Society of Automotive Engineers (SAE)
- American Petroleum Institute (API)
- National Lubricating Grease Institute (NLGI)
- Association des Constructeurs Europ e ens d' Automobiles (European Automobile Manufacturers Association) (ACEA)

API SERVICE GRADE CERTIFIED

9400-9

Fig. 2: API Symbol
Courtesy of CHRYSLER GROUP, LLC

Use an engine oil that is API Certified. MoparÃ® provides engine oils, meeting Material Standard MS-6395, that meet or exceed this requirement.

ENERGY CONSERVING OIL

An Energy Conserving type oil is recommended for gasoline engines. The designation of ENERGY CONSERVING is located on the label of an engine oil container.

CONTAINER IDENTIFICATION

9400-9

Fig. 3: API Symbol
Courtesy of CHRYSLER GROUP, LLC

Standard engine oil identification notations have been adopted to aid in the proper selection of engine oil. The identifying notations are located on the front label of engine oil plastic bottles and the top of engine oil cans.

This symbol means that the oil has been certified by the American Petroleum Institute (API). Chrysler only recommend API Certified engine oils that meet the requirements of Material Standard MS-6395. Use MoparÃ® or an equivalent oil meeting the specification MS-6395.

SYNTHETIC ENGINE OILS

Fig. 4: API Symbol
Courtesy of CHRYSLER GROUP, LLC

There are a number of engine oils being promoted as either synthetic or semi-synthetic. If you chose to use such a product, use **only** those oils that meet the American Petroleum Institute (API) and SAE viscosity standard. Follow the service schedule that describes your driving type.

ENGINE OIL ADDITIVES/SUPPLEMENTS

The manufacturer **does not recommend** the addition of any engine oil additives/supplements to the specified engine oil. Engine oil additives/supplements should not be used to enhance engine oil performance. Engine oil additives/supplements should not be used to extend engine oil change intervals. No additive is known to be safe for engine durability and can degrade emission components. Additives can contain undesirable materials that harm the long term durability of engines by:

- Doubling the level of Phosphorus in the engine oil. The ILSAC (International Lubricant Standard Approval Committee) GF-2 and GF-3 standards require that engine oil contain no more than 0.10% Phosphorus to protect the vehicles emissions performance. Addition of engine oil additives/supplements can poison, from the added sulfur and phosphorus, catalysts and hinder efforts to guarantee emissions performance to 80, 000 miles.
- Altering the viscosity characteristics of the engine oil so that it no longer meets the requirements of the specified viscosity grade.
- Creating potential for an undesirable additive compatibility interaction in the engine crankcase. Generally it is not desirable to mix additive packages from different suppliers in the crankcase; there have been reports of low temperature engine failures caused by additive package incompatibility with such mixtures.

ENGINE COOLANT

WARNING: **Antifreeze is an ethylene-glycol base coolant and is harmful if swallowed or inhaled. If swallowed, drink two glasses of water and induce vomiting. If inhaled, move to fresh air area. Seek medical attention immediately. Do not store in open or unmarked containers. Wash skin and clothing thoroughly after coming in contact with ethylene-glycol. Keep out of reach of children. Dispose of glycol base coolant properly, contact your dealer or government agency for location of collection center in your area. Do not open a cooling system when the engine is at operating temperature or hot under pressure, personal injury can result. Avoid radiator cooling fan when engine compartment related service is performed, personal injury can result.**

CAUTION: **Mixing of engine coolant (antifreeze) other than specified Organic Additive Technology (OAT) engine coolant (antifreeze), may result in engine damage and may decrease corrosion protection. Organic Additive Technology (OAT) engine coolant is different and should not be mixed with Hybrid Organic Additive Technology (HOAT) engine coolant (antifreeze). If a non-**

OAT engine coolant (antifreeze) is introduced into the cooling system in an emergency, it should be replaced with the specified engine coolant (antifreeze) as soon as possible.

The cooling system is designed around the coolant. The coolant must accept heat from engine metal, in the cylinder head area near the exhaust valves and engine block. Then coolant carries the heat to the radiator where the tube/fin radiator can transfer the heat to the air.

The use of aluminum cylinder blocks, cylinder heads, and water pumps requires special corrosion protection. MoparÂ® Antifreeze/Coolant, or the equivalent ethylene-glycol base coolant with organic corrosion inhibitors (called OAT, for Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% ethylene-glycol and 50% distilled water to obtain a freeze point of -37Â°C (-35Â°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

COOLANT PERFORMANCE

The required ethylene-glycol and water mixture depends upon climate and vehicle operating conditions. The coolant performance of various mixtures follows:

Pure Water- Water can absorb more heat than a mixture of water and ethylene-glycol. This is for purpose of heat transfer only. Water also freezes at a higher temperature and allows corrosion.

100 percent Ethylene-Glycol - The corrosion inhibiting additives in ethylene-glycol need the presence of water to dissolve. Without water, additives form deposits in system. These act as insulation causing temperature to rise to as high as 149Â°C (300Â°F). This temperature is hot enough to melt plastic. The increased temperature can result in sever engine damage. In addition, 100 percent ethylene-glycol freezes at -22Â°C (-8Â°F).

50/50 Ethylene-Glycol and Water - Is the recommended mixture, it provides protection against freezing to -37Â°C (-34Â°F). The antifreeze concentration **must always** be a minimum of 44 percent, year-round in all climates. If percentage is lower, engine parts may be eroded by cavitation. Maximum protection against freezing is provided with a 68 percent antifreeze concentration, which prevents freezing down to -67.7Â°C (-90Â°F). A higher percentage will freeze at a warmer temperature. Also, a higher percentage of antifreeze can cause the engine to overheat because specific heat of antifreeze is lower than that of water.

OAT coolant is purple in color. It cannot be mixed with other types of coolant including Chrysler's existing HOAT coolant and only should only be mixed with approved OAT coolant of the same color. Maintenance of the cooling system is not required unless a repair has been made with loss of coolant or the coolant has been contaminated.

CAUTION: Richer antifreeze mixtures cannot be measured with normal field equipment and can cause problems associated with 100 percent ethylene-glycol.

CAUTION: Do not use coolant additives that are claimed to improve engine cooling.

BRAKE FLUID

The brake fluid used in this vehicle must conform to DOT 3 specifications and SAE J1703 standards. If DOT 3 brake fluid is not available, then DOT 4 is acceptable. Use only MoparÂ® Brake Fluid or equivalent from a tightly sealed container.

CAUTION: Never use reclaimed brake fluid or fluid from a container which has been left open. An open container of brake fluid will absorb moisture from the air and contaminate the fluid.

CAUTION: Never use any type of a petroleum-based fluid in the brake hydraulic system. Use of such type fluids will result in seal damage of the vehicle brake hydraulic system causing a failure of the vehicle brake system. Petroleum based fluids would be items such as engine oil, transmission fluid, power steering fluid, etc.

A/C REFRIGERANT

The refrigerant used in this air conditioning system may be R-1234yf or R-134a, depending on market.

NOTE: **Refer to under-hood label for verification.**

The A/C refrigerant system is filled-for-life at the factory and requires no regular maintenance. Although not required at specific intervals, the charge level should be checked if system performance deteriorates or if a noise or leak is suspected. Refer to DIAGNOSIS AND TESTING .

FUSE - RELAY LOCATIONS AND TYPES

SPECIFICATIONS

SPECIFICATIONS

FRONT POWER DISTRIBUTION CENTER (PDC)

CAUTION:

- **When installing the PDC cover, it is important to ensure the cover is properly positioned and fully latched. Failure to do so may allow water to get into the PDC, and possibly result in a electrical system failure.**
- **When replacing a blown fuse, it is important to use only a fuse having the correct amperage rating. The use of a fuse with a rating other than indicated may result in a dangerous electrical system overload. If a properly rated fuse continues to blow, it indicates a problem in the circuit that must be corrected.**

HOISTING

STANDARD PROCEDURE

STANDARD PROCEDURE - HOISTING

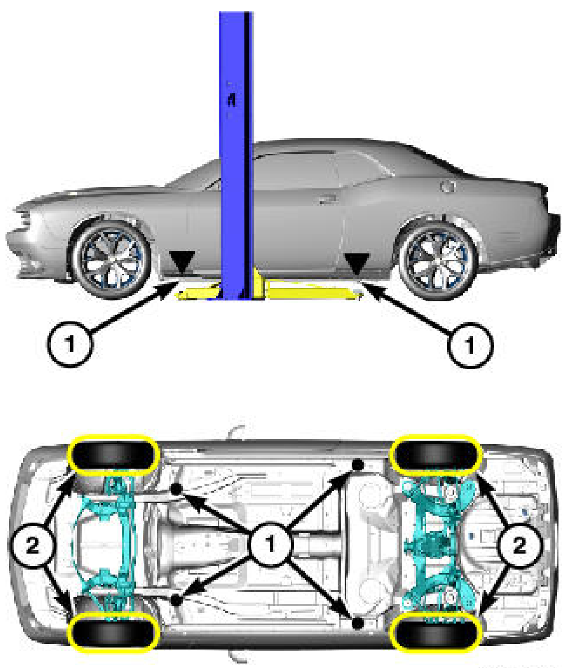

Fig. 7: Challenger Lifting Points
Courtesy of CHRYSLER GROUP, LLC

1 - FRAME CONTACT LIFT (SINGLE POST)
1 - CHASSIS LIFT (DUAL LIFT)
1 - OUTBOARD LIFT (DUAL LIFT)

1 - FLOOR JACK	
2 - DRIVE ON HOIST	

Refer to Owner's Manual provided with vehicle for proper emergency jacking procedures.

WARNING: The hoisting and jack lifting points provided are for a complete vehicle. When the engine or rear suspension is removed from a vehicle, the center of gravity is altered making some hoisting conditions unstable. Properly support or secure vehicle to hoisting device when these conditions exist. Failure to follow these instructions may result in serious or fatal injury.

CAUTION: Do not position hoisting device on any suspension component, including the front or rear suspension crossmembers. Do not hoist on the front and rear bumpers, the lower radiator crossmember, or the front engine mount.

Do not attempt to raise one entire side of the vehicle by placing a floor jack midway between the front and rear wheels. This practice may result in permanent damage to the body.

When properly positioned, a floor jack can be used to lift the vehicle and support the raised vehicle with jack stands.

A floor jack or any lifting device must never be used on any part of the underbody other than the described areas.

JUMP STARTING

STANDARD PROCEDURE

STANDARD PROCEDURE - JUMP STARTING

WARNING: Review all safety precautions and warnings in the battery system Service Information.

- **Take care to avoid the radiator cooling fan whenever the hood is raised. It can start anytime the ignition switch is ON. You can be hurt by the fan.**
- **Do not attempt to push or tow your vehicle to get it started. Vehicles equipped with an automatic transmission cannot be started this way. Unburned fuel could enter the catalytic converter and once the engine has started, ignite and damage the converter and vehicle. If the vehicle has a discharged battery, booster cables may be used to obtain a start from another vehicle. This type of start can be dangerous if done improperly, so follow this procedure carefully.**
- **Battery fluid is a corrosive acid solution; do not allow battery fluid to contact eyes, skin, or clothing. Don't lean over battery when attaching clamps or allow the clamps to touch each other. If acid splashes in eyes or on skin, flush contaminated area immediately with large quantities of water.**
- **A battery generates hydrogen gas, which is flammable and explosive. Keep flame or spark away from the vent holes.**
- **Do not use a booster battery or any other booster source with an output that exceeds 12 Volts.**
- **The battery in this vehicle has a vent hose that should not be disconnected and should only be replaced with a battery of the same type (vented).**

Failure to follow these instructions may result in serious or fatal injury.

CAUTION: When using another vehicle as a booster, do not allow vehicles to touch. Electrical systems can be damaged on either vehicle.

NOTE: The battery is stored under an access cover in the trunk. Remote battery terminals are located in the engine compartment for jump starting.

TO JUMP START A DISABLED VEHICLE:

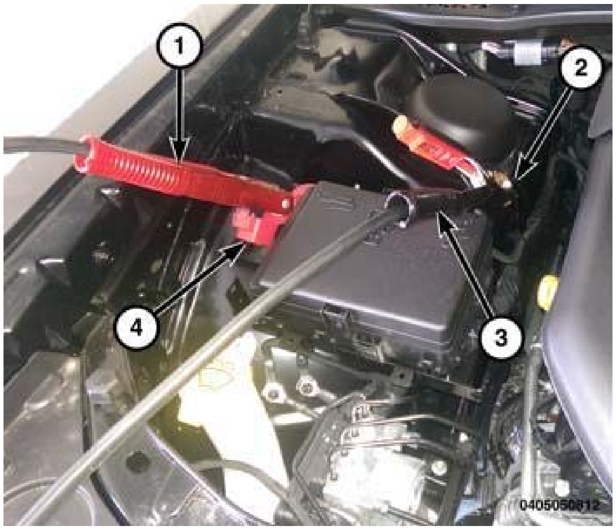

Fig. 8: Battery Jump Start Connections
Courtesy of CHRYSLER GROUP, LLC

1. Wear eye protection and remove any metal jewelry, such as watchbands or bracelets, that might make an inadvertent electrical contact.
2. When boost is provided by a battery in another vehicle, park that vehicle within booster cable reach, but do not allow the vehicles to touch one another.
3. Set the parking brake, place the automatic transmission in PARK, and turn the ignition switch to the LOCK position on both vehicles.
4. Turn off the heater, radio, and all unnecessary electrical loads.
5. Open the terminal cover (4) on the vehicle needing a jump start. Connect one end (1) of the jumper cable to the remote jump-start positive battery post (+) in the engine compartment. Connect the other end of the same cable to the positive terminal of the booster battery. Refer to the illustration for jump-starting connections. See **Fig. 8**.
6. Connect the other cable (3), first to the negative terminal of the booster battery and then to the engine ground (**-**) (2) of the vehicle with the discharged battery. Make sure you have a good contact on the engine ground. Refer to the illustration for jump-starting connections. See **Fig. 8**.
7. Start the engine in the vehicle that has the booster battery. Let the engine idle a few minutes. Then, start the engine in the vehicle with the discharged battery.
8. When removing the jumper cables, reverse the above sequence exactly. Be careful of the moving belts and fan.

WARNING:

- **You should not try to start your vehicle by pushing or towing.**
- **Do not connect the cable to the negative post of the discharged battery. The resulting electrical spark could cause the battery to explode.**
- **During cold weather when temperatures are below the freezing point, electrolyte in a discharged battery may freeze. Do not attempt jump-starting because the battery could rupture or explode. The battery temperature must be brought above the freezing point before attempting jump-start.**
- **Failure to follow these instructions may result in serious or fatal injury.**

MAINTENANCE SCHEDULES

DESCRIPTION

MAINTENANCE SCHEDULES - NAFTA

OIL CHANGE INDICATOR SYSTEM

This vehicle is equipped with an automatic oil change indicator system. The oil change indicator system will remind you that it is time to take your vehicle in for scheduled maintenance.

Based on engine operation conditions, the oil change indicator message will illuminate. This means that service is required for your vehicle. Operating conditions such as frequent short-trips, trailer tow, extremely hot or cold ambient temperatures, and E85 fuel usage will influence when the "Change Oil" or "Oil Change Required" message is displayed. Severe Operating Conditions can cause the change oil message to illuminate as early as 3, 500 miles (5, 600 km) since last reset. Have your vehicle serviced as soon as possible, within the next 500 miles (805 km).

The message "Oil Change Required" will be displayed and a single chime will sound, indicating that an oil change is necessary.

To reset the oil change indicator system, refer to **CENTER, ELECTRONIC VEHICLE INFORMATION, STANDARD PROCEDURE** .

NOTE: **Under no circumstances should oil change intervals exceed 10, 000 miles (16, 000 km) or twelve months, whichever comes first.**

Severe Duty All Models

Change Engine Oil at 4000 miles (6, 500 km) if the vehicle is operated in a dusty and off road environment. This type of vehicle use is considered Severe Duty.

Once A Month Or Before A Long Trip:

- Check engine oil level.
- Check windshield washer fluid level.
- Check tire pressure and look for unusual wear or damage. Rotate tires at the first sign of irregular wear, even if it occurs before your next scheduled service.
- Check the fluid levels of the coolant reservoir, brake master cylinder, and power steering and fill as needed.
- Check function of all interior and exterior lights.

At Every Oil Change Interval As Indicated By Oil Change Indicator System:

- Change oil and filter.
- Rotate the tires. **Rotate at the first sign of irregular wear, even if it occurs before the oil indicator system turns on.**
- Inspect battery and clean and tighten terminals as required.
- Inspect brake pads, shoes, rotors, drums, hoses and park brake.
- Inspect engine cooling system protection and hoses.
- Inspect exhaust system.
- Inspect engine air cleaner if using in dusty or off-road conditions.

REQUIRED MAINTENANCE INTERVALS

Mileage or time passed (whichever comes first)	20, 000	30, 000	40, 000	50, 000	60, 000	70, 000	80, 000	90, 000	100, 000	110, 000	120, 000	130, 000	140, 000	150, 000
Or Years:	2	3	4	5	6	7	8	9	10	11	12	13	14	15

Inspect front suspension, tie rod ends, boot seals and replace if necessary.	X	Ā	X	Ā	X	Ā	X	Ā	X	Ā	X	Ā	X	Ā
Inspect the rear axle fluid.	X	Ā	Ā	Ā	X	Ā	Ā	Ā	X	Ā	Ā	Ā	X	Ā
Inspect the manual transmission fluid (if equipped), add as necessary.	X	Ā	Ā	Ā	X	Ā	Ā	Ā	X	Ā	Ā	Ā	X	Ā
Inspect the brake linings, replace as necessary.	X	Ā	X	Ā	X	Ā	X	Ā	X	Ā	X	Ā	X	Ā
Adjust park brake on vehicles equipped with four wheel disc brakes.	X	Ā	X	Ā	X	Ā	X	Ā	X	Ā	X	Ā	X	Ā
Additional Maintenance														
Replace engine air filter.	Ā	X	Ā	Ā	X	Ā	Ā	X	Ā	Ā	X	Ā	Ā	X
Replace cabin/air conditioning filter.	X	Ā	X	Ā	X	Ā	X	Ā	X	Ā	X	Ā	X	Ā
Replace spark plugs. **	Ā	Ā	Ā	Ā	Ā	Ā	Ā	Ā	X	Ā	Ā	Ā	Ā	Ā
Flush and replace the engine coolant at 10 years or 150, 000 miles (240, 000 km) whichever comes first.	Ā	Ā	Ā	Ā	Ā	Ā	Ā	Ā	X	Ā	Ā	Ā	Ā	X
Change the manual transmission fluid (if equipped) if using your vehicle for any of the following: Most of your driving is at sustained speeds during hot weather, above 90Ā°F (32Ā°C), driving in dusty conditions, or stop and go driving.	Ā	Ā	X	Ā	Ā	Ā	X	Ā	Ā	Ā	X	Ā	Ā	Ā
Change the rear axle fluid if using your vehicle for any of the following: police, taxi, fleet, off-road, or frequent trailer towing.	Ā	Ā	X	Ā	Ā	Ā	X	Ā	Ā	Ā	X	Ā	Ā	Ā
Inspect and replace PCV valve if necessary.	Ā	Ā	Ā	Ā	Ā	Ā	Ā	Ā	X	Ā	Ā	Ā	Ā	Ā

** The spark plug change interval is mileage based only, yearly intervals do not apply.

MAINTENANCE SCHEDULES - NAFTA - SRT

OIL CHANGE INDICATOR SYSTEM

This vehicle is equipped with an automatic oil change indicator system. The oil change indicator system reminds you that it is time to take your vehicle in for scheduled maintenance.

The message "Oil Change Required" will be displayed and a single chime will sound, indicating that an oil change is necessary.

Based on engine operation conditions, the oil change indicator message will illuminate. This means that service is required for your vehicle. Have your vehicle serviced as soon as possible, within the next 500 miles (805 km).

To reset the oil change indicator system, refer to **CENTER, ELECTRONIC VEHICLE INFORMATION, STANDARD PROCEDURE** .

NOTE:

- **The oil change indicator message will not monitor the time since the last oil change. Change your vehicle's oil if it has been six months since your last oil change, even if the oil change indicator message is NOT illuminated.**
- **Change your engine oil more often if you drive your vehicle off-road for an extended period of time.**
- **Under no circumstances should oil change intervals exceed 6, 000 miles (10, 000 km) or six months, whichever comes first.**

At Each Stop For Fuel

- Check the engine oil level. Refer to "Maintenance Procedures/Engine Oil" in "Maintaining Your Vehicle" for further information.
- Check the windshield washer solvent and add if required.

Once A Month

- Check tire pressure and look for unusual wear or damage.
- Inspect the battery, and clean and tighten the terminals as required.
- Check the fluid levels of the coolant reservoir, brake master cylinder, and power steering (6.2L Only), and add as needed.
- Check all lights and other electrical items for correct operation.

At Each Oil Change

- Change oil and filter.
- Inspect the brake hoses and lines.

CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.

INSPECTION

INSPECTION

The following steps outline the dealer inspection procedure required every 5 years for vehicles covered under the terms of the Lifetime Powertrain Warranty. Refer to the appropriate warranty information for additional terms and coverages applicable to the Lifetime Powertrain Warranty.

1. Lift the vehicle on a suitable hoist.
2. Check all Powertrain components for leaks or physical damage. Note any concerns.
3. Lower the vehicle and check the level and condition of the engine oil.
4. Connect a diagnostic scan tool and check for any active Powertrain Diagnostic Trouble Codes (DTC).

NEW VEHICLE PREPARATION INSTRUCTIONS

STANDARD PROCEDURE

STANDARD PROCEDURE - NEW VEHICLE PREPARATION

VEHICLE READINESS
NOTE: **This document is for reference purposes only. The instructions are not VIN-specific, and it is not required to print or retain this document for each New Vehicle Prep performed.**

Description	Action
Place vehicle into Customer Mode	With the key in the "on" position, turn on the hazard lamps, then press and hold the up arrow on the steering wheel for 5 seconds. The EVIC display will update once the vehicle goes into customer mode. Once the mode has been changed, turn off the hazard lamps.
Keep All Protective Transit Film and Wheel Covers & Films on vehicle until sold, or up to 180 Days	Keep All Protective Transit Film and Wheel Covers & Films on vehicle until sold, or up to 180 Days.
Inflate tire pressure to max side wall pressure (except heavy duty trucks)	Increase the tire pressure to maximum sidewall pressure if vehicle is going into lot storage.
Install all **"Shipped Loose" items**	Install all **"Shipped Loose" items.**
Install Front License Plate Bracket **(if required)**	Install Front License Plate Bracket.
Install Shark Fin Antenna	Process. 1. Locate lower antenna module on vehicle roof. 2. Locate Pull Tab located on top of the roof installed module. 3. Pull tab - removing protective film cover (protects lower module from elements during shipping. 4. Locate upper shark fin (ships in vehicle trunk) and place atop lower module. 5. Apply hand force to "snap" fit.
Reset Tire Pressure Light Load Switch (if equipped)	If vehicle is going into storage and tire pressure is being set to max, switch the tire pressure light load setting to "max load" using the button on the instrument panel.

UNDERHOOD	
Description	**Action**
Hood Latch and Safety Catch - Adjust as Needed	Verify the operation of the hood release system including the inside hood release lever and the outside hood secondary safety catch. Adjust if necessary. The safety catch prevents the hood from going to the full open position until it is manually released. To test the safety catch, unlatch the hood with the interior hood release lever and attempt to raise the hood without operating the safety catch.
Battery State-of-Charge - document voltage	Check the battery state of charge by connecting a digital voltmeter at the jump-start locations. The battery voltage should be at least 12.4 volts. If charging is necessary, follow the service manual procedures and recharge the battery. Record voltage on New Vehicle Prep (NVP) form.
Loose Attachments, Routing and Clearance	Inspect the following for routing, loose attachments, connections, and clearance. Reroute and tighten as required: Brake Lines, Fuel Lines, Power Steering Hoses, Vacuum Hoses, Clutch Lines, Refrigerant Lines, Wiring, Belts.
All Fluid Levels	Refer to the owner's manual or appropriate service information for proper fluid level inspection locations and procedures.
No Fluid Leaks present	Visually inspect the underhood area to ensure absence of fluid leaks. Check clamps for tightness an full engagement.

ROAD TEST	
Description	**Action**
Perform Road Test, Mileage: Before ______ After ______	Record mileage before and after road test.
Engine Starts with All Keys	Start vehicle with all sets of keys.
All Warning Lights and Gauges / No DTCs	Verify all warning lights and gauges are operating properly, and no fault codes exist.

ROAD TEST	
Description	**Action**
Keyless Go	Ensure vehicle starts with push button, when key is inside vehicle.
Engine Starts Only in Park & Neutral	Verify engine will only start while automatic transmission is in park or neutral.
Engine Starts Only with Clutch Depressed	Verify engine will only start when clutch is depressed on manual transmission vehicles.
Service and Parking Brakes	Apply the service brakes while the car is in motion. Be sure the brake operation is smooth and positive. Make sure the vehicle stops in a straight line and without pulling to one side. Ensure there is no shudder or vibration when braking. Ensure that the parking brake is easy to operate. Make sure the parking brake does not drag.
Brake Transmission Shift Interlock	Ensure that the vehicle will only start when the brake is depressed on vehicles with automatic transmission.
Clutch / Manual Transmission Shifting	Check for smooth shifting. Make sure shift lever operates easily and smoothly. Check for proper synchronization. The gears should not grind.
Automatic Transmission Shifting	Make sure that the park lock mechanism holds the vehicle. With the vehicle on a grade, put the automatic transmission in park and slowly release the service brake to check the operation of the park mechanism. Make sure the shift lever operates easily and smoothly. Check for smooth shifting. Check for proper upshifting and downshifting.
Autostick	Verify that Autostick feature allows proper shifting through the gears.
Engine Performance - Cold	The engine should: start properly, idle smoothly and at proper speed, be free from stumbling or hesitation, produce sufficient power, be free of unusual noises, operate within the proper temperature range, and stop when the ignition key is shut off or stop button is depressed.
Engine Performance - Warm	The engine should: start properly, idle smoothly and at proper speed, be free from stumbling or hesitation, produce sufficient power, be free of unusual noises, operate within the proper temperature range, and stop when the ignition key is shut off or stop button is depressed.
Steering and Handling	Check that the power assist works properly. Make sure that the steering wheel does not vibrate abnormally at idle or road speed. Ensure that the steering wheel is centered when traveling in a straight line. Check that the vehicle does not drift to either side on flat road surfaces. Make sure that the vehicle does not vibrate or shake abnormally.
Noise, Vibration, Squeaks, or Rattles	Check that the vehicle is free of noise, vibrations, squeaks, or rattles. Tighten any loose fasteners.
Heater / Defrost- Front	Check the heater operation after the vehicle has reached operating temperature. Operate blower motor at all speeds. Operate the system in all modes. Check for hot air at all appropriate outlets. Check for temperature control operation.
Air Conditioning	Ensure that the A/C system cools properly. Operate blower motor at all speeds. Check for cool air at all temperature outlets. Operate the system in all modes.

ROAD TEST	
Description	**Action**
Defrost - Rear	Ensure that the electric heated rear defroster operates correctly. Turn on and feel for warmth.
Blindspot Monitoring System (if equipped)	While on road test, verify that the visual warning indicators located on the side view mirrors are operating properly when an object is within the detection zone.
Cruise Control (if equipped)	Check the "on/off" switch. Check the "set" operation. Check the "resume" function. Check the "accelerate" and "decelerate" function. Check the "cancel" button. Check the brake/clutch release function. If equipped, verify operation of Adaptive Cruise Control function.
Set Compass Variance / Calculation (if equipped)	Refer to the service information on TechCONNECT for information regarding compass setting procedures.
Transfer Case (if equipped)	Shift the transfer case through all ranges to make sure all shifting is smooth and operates properly.
Tire Pressure Monitoring System	Verify that Tire Pressure Monitoring Indicator Light is not illuminated when tires are above minimum inflation recommendations. Ensure that indicator lamp is not flashing/chiming.
Park Assist (if equipped)	Put vehicle in reverse and slowly back up toward an object. Verify that Park Assist warning icon, lights and chimes operate properly as object is approached.
Back-Up Camera (if equipped)	Put vehicle in reverse, verify that screen provides a clear and visible image from rear of vehicle.

INTERIOR	
Description	**Action**
Visually Inspect Interior Parts for Damage, Fit, etc.	From the interior of the vehicle, open and close all doors to ensure ease of operation. Fully open and close the glove box to ensure proper operation. Fully open and close the console door to ensure proper operation. Check interior panels for proper fit and free from damage.
All Interior Lamps and Horn	Operate and visually inspect all interior lights and switches, including: Dome/Map lamps, and if equipped the following: vanity mirror lamps, glove box lamps, ash tray lamp, cigar lighter lamp, radio lamps, door mounted lamps, illuminated entry system. Ensure that the horn operates properly.
Rear View Mirror	Check that the rearview mirror's day/night function Is operating properly.
Front and Rear Wipers and Washers	Activate front windshield wipers, and if equipped, rear window wipers and check for proper operation at all speeds. Activate the front and if equipped, the rear washer. Check the spray pattern for proper operation and aim. Check the intermittent wipe feature for proper operation.
All interior Door Locks including Child Locks	Check all interior door locks for proper operation, including rear child safety door locks if equipped. Place in the unlocked position.
Steering Wheel Mounted Controls	Check all steering wheel controls for proper operation.
Cigar Lighter	Check cigar lighter for proper operation.

INTERIOR	
Description	**Action**
Power Windows and Window Lock Switch	Fully open and close all power windows to ensure proper operation and sealing. Ensure that the windows operate properly at each door. Verify that window lock button is operating properly.
Outside Power Mirrors	Check power mirrors for proper operation.
Power Heated Mirrors (if equipped)	Check power heated mirrors for proper operation.
Seats and Seat Belts - All Adjustments	Check for correct installation and operation of seat and shoulder belts, and retractors. Check that the restraint system safety labels regarding the use of seatbelts and airbags are in place. Fully cycle the seats for proper adjustments and verify that each seat is securely mounted. Fold down and latch the rear seats. Pull forward to check that the latches operate correctly. Check for proper head restraint operation.
Power Sunroof (if equipped)	Cycle sunroof. Ensure that the sunroof opens and closes easily. Verify proper operation of one touch open/close feature if equipped.
Set Clock(s)	Set all clocks to correct time. Refer to Owner's Manual for information regarding clock setting procedures.
Audio System	Turn the radio on and check reception in both AM and FM modes. Check that the CD player operates properly. Check for good sound quality from all speakers.
Satellite Radio (if equipped)	Turn on satellite radio and verify reception.
Satellite Streaming Video (if equipped)	Satellite Streaming Video.
Heated Steering Wheel (if equipped)	Verify that heated steering wheel is functioning properly.
Power Outlet(s)	Check all power outlets for proper operation.
Integrated Child Seat / Belt	Check the child restraints and child seats for proper operation.
Power folding Headrests (if equipped)	Verify proper operation of power folding third row head restraints by pressing the power folding switch located on the instrument panel switch bank.
Heated Seats (if equipped)	Check for proper operation of heated seats on all power levels, on all equipped seats.
Power Cooled Seats (if equipped)	Check for proper operation of ventilated seats on all power levels, on all equipped seats.

EXTERIOR	
Description	**Action**
Inspect Body and Paint for Damage and Fit/ Finish	Inspect the body exterior for damage, loose or missing items. During the inspection, ensure that no vehicle damage occurred from the time the vehicle was received and the beginning of the New Vehicle Preparation.
Exterior Lamps - Headlamps, Turn Signals, Hazards, Park/Tail/License Plate, Trunk Lights, etc.	Operate and visually inspect the following: Headlamps (High/Low Beams), turn signals, hazard warning flashers, parking/tail/license plate lamps, reverse/back up lamps, fog lamps, stop lamps including center mounted stop lamp, daytime running lamps (if equipped), clearance lamps, cargo bed lamps, any other lamps.
Lock and Unlock all doors with all mechanical keys	Verify all doors lock and unlock with all mechanical keys.

EXTERIOR	
Description	**Action**
Doors, Liftgate and Tailgate- Adjust Strikers as Needed	Open each door/liftgate/tailgate from the outside to check outside door handle operation. Check the door detent. Partially close all doors to check the open-door detent. Close all doors/liftgates/tailgates to check the operation of latches and strikers. Adjust strikers as required. Verify liftgate/tailgate ease of operation.
Security Alarm Test (if equipped)	Lock doors using the Remote Keyless Entry Transmitter. Verify the operation of the Vehicle Security System warning lamp.
Passive Entry (if equipped)	Verify that the Keyless Enter-N-Go feature is operating properly, by grabbing the door handle of the locked vehicle, while the Remote Keyless Entry transmitter key is within 5 feet of the vehicle. The door should unlock automatically.
Remote Keyless Entry (if equipped)	Verify that doors unlock properly using all key FOBS.
Remote Start (if equipped)	Verify that engine starts with all keys when using Remote Keyless Entry Transmitter.

VEHICLE STORAGE	
Description	**Action**
Keep all protective transit film, wheel covers and films on vehicle until sold	Keep all protective transit film, wheel covers and films on vehicle until sold.
Inflate tire pressure to max side wall pressure	Inflate tire pressure to max side wall pressure (except heavy duty trucks.) Periodically move vehicles to prevent Flat Spotting on tires
Place vehicle into Ship Mode	With the key in the "on" position, turn on the hazard lamps, then press and hold the up arrow on the steering wheel for 5 seconds. The EVIC display will update once the vehicle goes into ship mode. Once the mode has been changed, turn off the hazard lamps.

FINAL DETAIL & INSPECTION	
Description	**Action**
Perform all incomplete recalls and Rapid Response Transmittals (RRT's)	Perform all incomplete recalls and RRT's.
Remove interior and exterior Transportation Protective Covers	Remove exterior protective coatings/coverings from vehicle, remove interior protective covers, grease markings on door jambs, unnecessary labels, etc.
Inspect paint and body, touch up as needed	Make sure that the body is free from paint chips or scratches. Touch up any chips/scratches using thin layers of paint. Ensure that the body is free from dings and dents.
Place vehicle into Customer Mode	With the key in the "on" position, turn on the hazard lamps, then press and hold the up arrow on the steering wheel for 5 seconds. The EVIC display will update once the vehicle goes into customer mode. Once the mode has been changed, turn off the hazard lamps.
Test and record battery state of charge	Check the battery state of charge by connecting a digital voltmeter at the jump-start locations. The battery voltage should be at least 12.4 volts. If charging is necessary, follow the service information procedures and recharge the battery. Record voltage on New Vehicle Prep (NVP) form.

FINAL DETAIL & INSPECTION	
Description	**Action**
Adjust tire pressures including spare to door placard	Adjust tire pressures including spare to door placard.
Reset Tire Pressure Light Load Switch (if equipped)	Reset the Tire Pressure Light Load Switch back to the "Light Load" setting using the switch on the instrument panel.
Wash and clean vehicle exterior	Wash the entire vehicle. Clean the tire sidewalls and wheel/wheel covers (use non - acidic wheel cleaner). Clean exterior/interior glass surfaces.
Clean vehicle interior	Inspect the interior trim, seats, carpeting, and moldings. Clean as necessary.

TOWING

STANDARD PROCEDURE

STANDARD PROCEDURE - TOWING

CAUTION: DO NOT use sling-type equipment when towing. When securing the vehicle to a flatbed truck, do not attach to front or rear suspension components. Damage to your vehicle may result from improper towing.

CAUTION: Do not dolly tow this vehicle. Use of a towing dolly can cause significant damage to your vehicle. Damage from improper towing is not covered under the New Vehicle Limited Warranty.

CAUTION: Towing this vehicle in violation of the below requirements can cause severe transmission damage. Damage from improper towing is not covered under the New Vehicle Limited Warranty.

NOTE: This Service Information describes procedures for towing a disabled vehicle using a commercial wrecker service.

Towing Condition	Wheels OFF The Ground	AUTOMATIC TRANSMISSION	MANUAL TRANSMISSION
Flat Tow	NONE	**If transmission is operable:** • Transmission in **NEUTRAL** • 30 mph (48 km/h) **max** speed • 30 miles (48 km) **max** distance	**If transmission is operable:** • Transmission in **NEUTRAL** • 30 mph (48 km/h) **max** speed • 30 miles (48 km) **max** distance
Wheel Lift Or Dolly Tow	Front	**NOT ALLOWED**	**NOT ALLOWED**
	Rear	NOT RECOMMENDED	NOT RECOMMENDED
Flatbed	**ALL**	**BEST METHOD**	**BEST METHOD**

Towing A Disabled Vehicle

- Proper towing or lifting equipment is required to prevent damage to your vehicle. Use only tow bars and other equipment designed for this purpose, following equipment manufacturer's instructions. Use of safety chains is mandatory. Attach a tow bar or other towing device to main structural members of the vehicle, not to bumpers or associated brackets. State and local laws regarding vehicles under tow must be observed.
- If you must use the accessories (wipers, defroster, etc.) while being towed, the key must be in the ON/RUN position, not

the ACC position.

Automatic Transmission

- The manufacturer recommends towing your vehicle with all four wheels OFF the ground using a flatbed.
- If flatbed equipment is not available, and the transmission is operable, the vehicle may be flat towed (with all four wheels on the ground) under the following conditions:
  - The transmission must be in NEUTRAL.
  - The towing distance must not exceed 30 miles (48 km).
  - The towing speed must not exceed 30 mph (48 km/h).

If the transmission is not operable, or the vehicle must be towed faster than 30 mph (48 km/h) or farther than 30 miles (48 km), then the only acceptable method of towing is with a flatbed truck.

Manual Transmission

- The manufacturer recommends towing your vehicle with all four wheels OFF the ground using a flatbed.
- If flatbed equipment is not available, and the transmission is operable, the vehicle may be flat towed (with all four wheels on the ground) under the following conditions:
  - The transmission must be in NEUTRAL.
  - The towing distance must not exceed 30 miles (48 km).
  - The towing speed must not exceed 30 mph (48 km/h).

If the transmission is not operable, then the only acceptable method of towing is with a flatbed truck.

.

Article GUID: A00735864

DESCRIPTION

VEHICLE THEFT SECURITY SYSTEM

The Vehicle Theft Security System (VTSS) is available factory-installed equipment for this vehicle. The VTSS includes various standard and optional features that provide both passive and active protection against unauthorized vehicle access and operation. The VTSS is comprised of two primary subsystems: The Sentry Key Immobilizer System (SKIS) and the Vehicle Theft Alarm (VTA). Additional details of each of these subsystems and their components can be found elsewhere within this service information.

Except for the Sentry Key transponders which rely upon Radio Frequency (RF) communication, hard wired circuitry connects the VTA and SKIS components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the SKIS or VTA components through the use of a combination of soldered splices, splice block connectors and many different types of wire harness terminal connectors and insulators. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin out and location views for the various wire harness connectors, splices and grounds.

SENTRY KEY IMMOBILIZER SYSTEM

The Sentry Key Immobilizer System (SKIS) is factory-installed standard equipment on this model. The SKIS provides passive vehicle protection, immobilizing the vehicle by preventing the engine from operating unless a valid electronically encoded key or FOB with Integrated Key (FOBIK) is detected. In vehicles equipped with the Passive Entry - Keyless Go (PEKG) system, the valid FOBIK must only be present somewhere within the passenger compartment of the vehicle for the engine to continue to operate.

The SKIS includes the following major components, which are described in further detail elsewhere within this service information:

- **Keyless Ignition Node** - The Keyless Ignition Node (KIN) is located in the instrument panel just inboard of the steering column. Refer to **MODULE, KEYLESS IGNITION NODE, DESCRIPTION** .
- **Low Frequency Antenna** - Vehicles equipped with the Passive Entry Keyless Go (PEKG) system have several low frequency antenna units strategically placed within the vehicle.
- **Powertrain Control Module** - The Powertrain Control Module (PCM) (also known as the Engine Control Module/ECM) is located in the engine compartment. Refer to **MODULE, POWERTRAIN CONTROL, DESCRIPTION** .
- **Radio Frequency Hub Module** - The Radio Frequency Hub Module (RFHM) (also known as the RF Hub) is located on the package shelf support behind the rear seat back where it is concealed beneath the package shelf trim. Refer to **MODULE, RADIO FREQUENCY (RF HUB), DESCRIPTION** .
- **Sentry Key Transponder** - A Sentry Key transponder microchip is located within each FOB with Integrated Key (FOBIK). Refer to **KEY, TRANSPONDER, DESCRIPTION**.

The PCM and the RFHM each contain a microcontroller and programming that allow them to communicate with each other and other electronic modules in the vehicle using the Controller Area Network (CAN) data bus. In addition, the KIN and the RFHM communicate with each other using a Local Interface Network data bus. Refer to **COMMUNICATION, DESCRIPTION** .

Hard wired circuitry connects the various SKIS system components to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other and to the vehicle electrical system through the use of a combination of soldered splices, splice block connectors and many different types of wire harness terminal connectors and insulators. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention as well as pin out and location views for the various wire harness connectors, splices and grounds.

VEHICLE THEFT ALARM

The Vehicle Theft Alarm (VTA) is factory-installed optional equipment on this vehicle. This system provides perimeter vehicle protection by monitoring the vehicle doors, the deck lid and the status of the ignition switch (also known as the Keyless Ignition Node/KIN). If unauthorized vehicle use or tampering is detected, the system responds by pulsing the vehicle horn as an audible deterrent and flashing certain exterior lamps as a visual deterrent.

The VTA includes the following major components, which are described in further detail elsewhere in this service information:

- **Body Control Module** - The Body Control Module (BCM) (also known as the Common Body Controller/CBC) is located on the right cowl side inner (kick) panel within the passenger compartment, where it is concealed behind the instrument panel and the cowl side trim panel. Refer to **MODULE, BODY CONTROL, DESCRIPTION** .
- **Deck Lid Ajar Switch** - A deck lid ajar switch is integral to the latch for the deck lid in the vehicle. Refer to **LATCH, REMOVAL** .
- **Door Ajar Switches** - A door ajar switch is integral to the door latch mechanism of each door. Refer to **LATCH, REMOVAL** .
- **Keyless Ignition Node** - The Keyless Ignition Node (KIN) is located in the instrument panel just inboard of the upper steering column opening. Refer to **MODULE, KEYLESS IGNITION NODE, DESCRIPTION** .
- **Radio Frequency Hub Module** - The Radio Frequency Hub Module (RFHM) (also known as the RF Hub) is located on the package tray support behind the rear seat back where it is concealed beneath the package shelf trim. Refer to **MODULE, RADIO FREQUENCY (RF HUB), DESCRIPTION** .
- **Security Indicator** - The security indicator is integral to the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) located in the instrument panel above the steering column opening, directly in front of the driver. Refer to **DESCRIPTION** .

The BCM and the RFHM each contain a microcontroller and programming that allow them to communicate with each other and other electronic modules in the vehicle using the Controller Area Network (CAN) data bus. In addition the KIN and the RFHM communicate with each other using a dedicated Local Interface Network data bus. Refer to **COMMUNICATION, DESCRIPTION** .

OPERATION

VEHICLE THEFT SECURITY SYSTEM

The Vehicle Theft Security System (VTSS) is comprised of two primary subsystems: Sentry Key Immobilizer System (SKIS) and Vehicle Theft Alarm (VTA). Additional operational details on each of these two subsystems of the VTSS can be found elsewhere within this service information.

SENTRY KEY IMMOBILIZER SYSTEM

The Sentry Key Immobilizer System (SKIS) is designed to provide passive protection against unauthorized vehicle use by disabling the engine after about two seconds of running whenever any method other than a valid Sentry Key FOB with Integrated Key (FOBIK) is used to start the vehicle. The SKIS is considered a passive protection system because it is always active when the ignition system is energized and does not require any customer intervention. The SKIS uses Low Frequency (LF) Radio Frequency (RF) communication to obtain confirmation that the FOBIK is valid for operating the vehicle.

The microcontroller-based Radio Frequency Hub Module (RFHM) (also known as the RF Hub) contains the SKIS software. The RFHM uses electronic messages over a dedicated Local Interface Network (LIN) data bus to communicate with the ignition switch (also known as the Keyless Ignition Node/KIN) and also uses electronic messages to communicate with other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. Refer to **COMMUNICATION, OPERATION** .

Pre-programmed Sentry Key FOBIK transponders are provided with the vehicle from the factory. Each RFHM will recognize a maximum of eight Sentry Key FOBIK transponders. If the customer would like additional FOBIK units other than those provided with the vehicle, they may be purchased from any authorized dealer. These additional FOBIK units must be programmed to the RFHM in the vehicle in order for the system to recognize them as valid. This can be done by the dealer using a diagnostic scan tool. All FOBIK units authorized for use in a given vehicle must be present in the vehicle when programming takes place in order to remain valid. Refer to **STANDARD PROCEDURE** .

The RFHM performs a self-test of the SKIS each time the status of the ignition transitions out of Off, and will store fault information in the form of a Diagnostic Trouble Code (DTC) if a system malfunction is detected. The RFHM will also send an electronic message to the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) if a fault is detected, and the IC responds by illuminating the security indicator or displaying a textual message in the Electronic Vehicle Information Center (EVIC) display.

The hard wired circuits between components related to the SKIS may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SKIS or the electronic controls and communication between other modules and devices that provide some features of the SKIS. The most reliable, efficient and accurate means to diagnose the SKIS or the electronic controls and communication related to SKIS operation requires the use of a diagnostic scan tool. Refer to the appropriate Diagnostic & Testing article.

VEHICLE THEFT ALARM

The Body Control Module (BCM) (also known as the Common Body Controller/CBC) and the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) are used on this vehicle to control and integrate many of the functions and features included in the Vehicle Theft Alarm (VTA). In the VTA system, the BCM receives inputs indicating the status of the door ajar switches, the ignition switch, the deck lid ajar switch and the power lock switches.

The BCM processes the information from all of these inputs and sends the appropriate electronic messages to other electronic modules over the Controller Area Network (CAN) data bus. The BCM internally controls the output to the hazard warning lamps and sends a control output to energize or de-energize the horn relay as appropriate. The RFHM relays the status of the ignition and all RF commands received from the Remote Keyless Entry (RKE) buttons of the FOB with Integrated Key (FOBIK) to other electronic modules over the CAN data bus.

The hard wired circuits between the components related to the VTA system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. The wiring information includes wiring diagrams, details of wire harness routing and retention, connector pin out information, and location views for the various wire harness connectors, splices, and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the VTA system or the electronic controls and communication between modules and devices that provide some features of the VTA system. The most reliable, efficient and accurate means to diagnose the VTA system or the electronic controls and communication related to VTA system operation requires the use of a diagnostic scan tool. Refer to the appropriate Diagnostic & Testing article.

Following are paragraphs that briefly describe the operation of each of the VTA features. See the owner's manual in the vehicle glove box for arming and disarming procedures, use and operation of the VTA.

OPERATING MODES

Following are paragraphs that briefly describe the operation of each of the Vehicle Theft Alarm (VTA) operating modes.

- **Enabling** - The Body Control Module (BCM) (also known as the Common Body Controller/CBC) must have the Vehicle Theft Alarm (VTA) function electronically enabled in order for the VTA to perform as designed. The logic within the BCM keeps its VTA function dormant until it is enabled using a diagnostic scan tool. The VTA function of the BCM is enabled on vehicles equipped with the VTA option at the factory, but a service replacement BCM must be VTA-enabled by the dealer using a diagnostic scan tool. Refer to the appropriate Diagnostic & Testing article.
- **Arming** - Passive arming of the VTA occurs when the vehicle is exited with the FOB with Integrated Key (FOBIK), the headlamps are turned Off, and the doors are locked while they are open using the power lock switch. Active arming occurs when the Lock button on the FOBIK is pressed to lock the vehicle. For active arming to occur, the doors and the deck lid must be closed and the status of the Keyless Ignition Node (KIN) must be Off when the FOBIK Lock button or the Lock button on the Passive Entry (PE) handle is pressed. The power lock switches will not function if the FOBIK is within the vehicle interior.

  Pre-arming of the VTA is initiated when a door or the deck lid is open when the vehicle is locked using a power door lock switch or when the FOBIK Lock button is pressed. Pre-arming will not occur if the

FOBIK is within the vehicle interior. When the VTA is pre-armed, the arming sequence is delayed until all of the doors and the deck lid have been closed. The VTA will remain in pre-armed mode for up to 16 seconds after all doors and the deck lid have been closed.

Once the VTA begins the passive or active arming sequence, the security indicator in the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) will flash rapidly for about 16 seconds. This indicates that VTA arming is in progress. If the ignition transitions to the On status, if a door or the deck lid is unlocked and opened by any means or if the RKE Panic button is depressed during the 16 second arming process, the security indicator will stop flashing and the arming process will abort. Once the arming sequence is successfully completed, the security indicator will flash at a slower rate, indicating that the VTA is armed.

- **Disarming** - Press the FOBIK Unlock button or with one of the valid FOBIK units located outside the vehicle and within 1.5 meters (5 feet) of the driver or passenger front door handles, grab the Passive Entry (PE) handle and enter the vehicle, then press the Start/Stop/Button (SSB) to transition the ignition status to On. This requires at least one valid FOBIK be located within the passenger compartment of the vehicle.
- **Alarm** - The VTA alarm provides both visual and audible outputs; however, the time intervals of these outputs vary by the requirements of the market for which the vehicle is manufactured. In all cases, the visual output will be a flashing On and Off of the exterior lamps and the audible output will be a pulsing of the horn. See the owner's manual in the vehicle glove box for details of the alarm output requirements of the specific market for which the vehicle was manufactured. The inputs that will trigger the alarm include the door ajar switches and the deck lid ajar switch.
- **Power-Up Mode** - When the armed VTA senses that the battery has been disconnected and reconnected, it enters its power-up mode. In the power-up mode, the alarm system remains armed following a battery failure or disconnect. If the VTA was armed prior to a battery disconnect or failure, the technician or the vehicle operator will have to actively or passively disarm the alarm system after the battery is reconnected. The power-up mode will also apply if the battery goes dead while the system is armed and battery jump-starting is attempted. The VTA will be armed until the technician or the vehicle operator has actively or passively disarmed the alarm system. If the VTA is in the disarmed mode prior to a battery disconnect or failure, it will remain disarmed after the battery is reconnected or replaced, or if jump-starting is attempted.
- **Tamper Alert** - If the VTA alarm was triggered, the VTA tamper alert feature will give the message **REMOTE START DISABLED - START VEHICLE TO RESET** in the Electronic Vehicle Information Center (EVIC) and the horn will beep three short beeps. This message will display once the vehicle is properly disarmed by unlocking the vehicle with a valid FOBIK. This message can also display if the alarm has since timed out or if the battery has been disconnected and reconnected. This feature alerts the vehicle operator that the VTA alarm was activated while the vehicle was unattended.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - VEHICLE THEFT SECURITY SYSTEM

The Vehicle Theft Security System (VTSS) is divided into two basic subsystems: Sentry Key Immobilizer System (SKIS) and Vehicle Theft Alarm (VTA). The recommended procedures for diagnosis and testing of each of these two VTSS subsystems can be found elsewhere within this service information.

DIAGNOSIS AND TESTING - SENTRY KEY IMMOBILIZER SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

The hard wired circuits between components related to the Sentry Key Immobilizer System (SKIS) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. The wiring information includes wiring diagrams, procedures for proper wire and connector repair, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices, and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SKIS or the electronic controls and communication between modules and devices that provide some features of the SKIS. The most reliable, efficient and accurate means to diagnose the SKIS or the electronic controls and communication related to SKIS operation requires the use of a diagnostic scan tool. Refer to the appropriate Diagnostic & Testing article.

SENTRY KEY IMMOBILIZER SYSTEM DIAGNOSIS		
CONDITION	**POSSIBLE CAUSES**	**CORRECTION**
SECURITY INDICATOR FAILS TO LIGHT DURING BULB TEST	1. Ineffective Light-Emitting Diode (LED).	1. Use a diagnostic scan tool to perform the instrument cluster actuator test. Refer to the appropriate Diagnostic & Testing article.
	2. Ineffective fuse.	2. Check the Radio Frequency Hub Module (RFHM) fused B(+) fuse and the fused ignition output (run-start) fuse in the Power Distribution Center (PDC). Replace the fuses, if required.
Ā	3. Ineffective ground circuit.	3. Test and repair the open ground circuit at the connector for the RFHM, if required.
Ā	4. Ineffective battery feed circuit.	4. Test and repair the open battery feed circuit at the connector for the RFHM, if required.
SECURITY INDICATOR FLASHES FOLLOWING BULB TEST	1. Invalid FOBIK.	1. Remove the invalid FOBIK and try again with a known valid FOBIK.
	2. Key-related fault.	2. Use a diagnostic scan tool and the appropriate diagnostic information for further diagnosis.
SECURITY INDICATOR LIGHTS SOLID FOLLOWING BULB TEST	1. SKIS system malfunction/fault detected.	1. Use a diagnostic scan tool and the appropriate diagnostic information for further diagnosis.
	2. SKIS system ineffective.	2. Use a diagnostic scan tool and the appropriate diagnostic information for further diagnosis.

DIAGNOSIS AND TESTING - VEHICLE THEFT ALARM

The hard wired circuits between components related to the Vehicle Theft Alarm (VTA) system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. The wiring information includes wiring diagrams, procedures for proper wire and connector repair, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices, and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the VTA system or the electronic controls and communication between modules and devices that provide some features of the VTA system. The most reliable, efficient and accurate means to diagnose the VTA system or the electronic controls and communication related to VTA system operation requires the use of a diagnostic scan tool. See the **Vehicle Theft Security System** menu item on the scan tool. Refer to the appropriate Diagnostic & Testing article.

STANDARD PROCEDURE

SENTRY KEY IMMOBILIZER SYSTEM INITIALIZATION

The Sentry Key Immobilizer System (SKIS) must be initialized following a Radio Frequency Hub Module (RFHM) (also known as the RF Hub) replacement. SKIS initialization requires the use of a diagnostic scan tool. Initialization will also require that you have access to the unique four-digit PIN code that was assigned to the original RFHM. The PIN code **must** be used to enter the Secured Access Mode in the RFHM. This PIN number may be obtained from the vehicle owner, from the original vehicle invoice or from the Chrysler Customer Center. Refer to STANDARD PROCEDURE .

NOTE: **If a Powertrain Control Module (PCM) is replaced on a vehicle equipped with the Sentry Key Immobilizer System (SKIS), the unique Secret Key data must be transferred from the RFHM to the new PCM using the appropriate programming procedure. This procedure also requires the use of a diagnostic scan tool and the unique four-digit PIN code to enter the Secured Access Mode in the RFHM. Refer to the appropriate Diagnostic & Testing article for the proper PCM programming procedures.**

SENTRY KEY TRANSPONDER PROGRAMMING

The Sentry Key transponder of all FOB with Integrated Key (FOBIK) units included with the vehicle are pre-programmed to work with the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) when it is shipped from the factory. The RFHM may be programmed to recognize up to a total of eight FOBIK units. When programming a blank Sentry Key FOBIK, the integrated valet key must be cut to match the door lock cylinder in the vehicle for which it will be used. Once the additional or new key has been cut, the RFHM must be programmed to recognize it as a valid FOBIK. Refer to STANDARD PROCEDURE .

KEY, TRANSPONDER

DESCRIPTION

DESCRIPTION

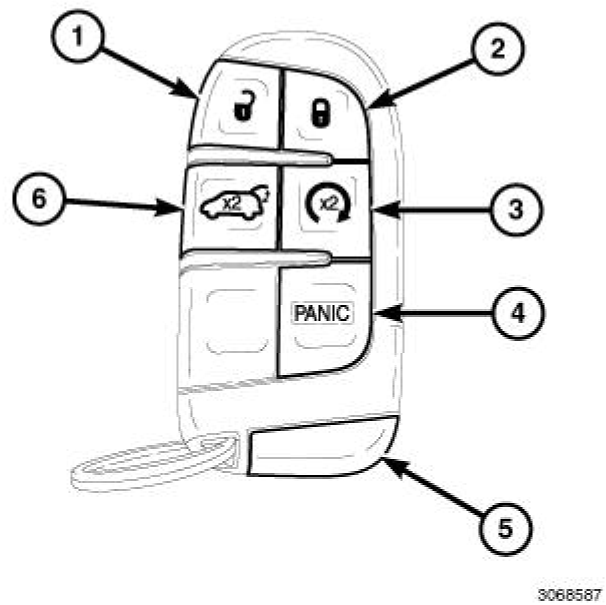

Fig. 1: Transponder Key
Courtesy of CHRYSLER GROUP, LLC

Vehicles are shipped from the factory with two FOB with Integrated Key (FOBIK) Remote Keyless Entry (RKE) transmitters programmed to the vehicle as standard equipment. The FOBIK circuitry is contained and protected within a molded plastic case with a black soft rubber touch pad on the face divided into six sections. The rearward end of the FOBIK case houses a mechanical, metal, coded emergency key (5) that is released by sliding a latch button on the back of the FOBIK case.

Depending upon vehicle equipment, each FOBIK has at least three and no more than five functional resistive membrane switches located beneath the six touch pad sections. Each functional touch pad section is clearly identified by white icons or white text and icons identifying the specific function obtained by pushing that button. Domestic market vehicles also include a touch pad section on the FOBIK with the red text **PANIC** applied to it. Not counting the **PANIC** touch pad (4), the available switches include:

- **Unlock (1)**

  - Standard equipment.

- **Lock (2)** - Standard equipment.
- **Remote Start (3)** - Only for vehicles equipped with the factory-installed remote start system.
- **Liftgate/Deck Lid (6)** - Standard equipment.

The FOBIK RKE transmitter is the primary customer active interface for remotely operating the power lock system, the RKE system, and the remote start system components and features. However, the FOBIK also has an important passive role in each of the following vehicle systems:

- **Keyless Go System**
- **Passive Entry System**
- **Sentry KeyÂ® Immobilizer System (SKIS)**
- **Vehicle Theft Alarm (VTA)**

Other than battery replacement, the FOBIK cannot be adjusted or repaired. If damaged or ineffective, the FOBIK must be replaced with a new unit. A new and unused FOBIK unit must be properly programmed in order to function properly with the systems of the vehicle. The mechanical emergency key of the new FOBIK must also be cut to match the coding of the lock cylinders in the vehicle.

OPERATION

OPERATION

When the status of the ignition switch (also known as the Keyless Ignition Node/KIN) transitions to On, it sends an electronic **ignition switch status** message over a dedicated Local Interface Network (LIN) serial bus circuit to the Radio Frequency Hub Module (RFHM) (also known as the RF Hub). In vehicles that are equipped with the PEKG system, the RFHM relies upon several Low Frequency (LF) antenna units to challenge the Sentry Key transponders using a LF signal, then monitors responses from the Sentry Key transponders received as Very High Frequency (VHF) signals. The RFHM determines whether a valid key is present based upon the response from the transponder.

If a valid key is detected, that fact is communicated by the RFHM to the Powertrain Control Module (PCM) (also known as the Engine Control Module/ECM) over the Controller Area Network (CAN) data bus, and the PCM allows the engine to continue running. If the PCM receives an invalid key message, or receives no message from the RFHM over the CAN data bus, the engine will be disabled after about two seconds of operation. The Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) will also respond to the invalid key message on the CAN data bus by flashing the security indicator On and Off.

Likewise, when any one of the Remote Keyless Entry (RKE) transmitter buttons of the FOB with Integrated Key (FOBIK) is depressed, the on-board transmitter of the FOBIK generates a high frequency RF request signal that is received and validated by the RFHM. If the RFHM determines that the RKE transmitter RF request signal was generated by a FOBIK that is valid for the vehicle, the RFHM relays electronic request messages to the appropriate electronic modules in the vehicle over the CAN data bus to invoke the functions or features associated with the request.

Each vehicle owner is provided with a four-digit Personal Identification Number (PIN) by the dealer at the time of vehicle purchase. This number also appears on the original vehicle invoice and is required along with a diagnostic scan tool for the dealer to program an additional or replacement FOBIK into the electronics of the vehicle. The mechanical emergency key included with a new additional or replacement blank FOBIK must also be cut to match the coding of the lock cylinders in the vehicle.

Each Sentry Key has a unique transponder identification code permanently programmed into it by the manufacturer. Likewise, the RFHM has a unique Secret Key code programmed into it by the manufacturer. When a Sentry Key is programmed into the memory of the RFHM, the RFHM stores the transponder identification code from the Sentry Key, and the Sentry Key learns the Secret Key code from the RFHM. Once the Sentry Key learns the Secret Key code of the RFHM, it is permanently stored in the memory of the transponder. Therefore, once a Sentry Key has been programmed to a particular vehicle, it cannot be used on any other vehicle. Refer to **STANDARD PROCEDURE**.

The Sentry Key Immobilizer System (SKIS) performs a self-test each time the ignition switch status transitions to On, and will store key-related fault information in the form of a Diagnostic Trouble Code (DTC) in RFHM memory if a Sentry Key transponder problem is detected. The Sentry Key transponder chip can be diagnosed, and any stored DTC can be retrieved using a diagnostic scan tool. Refer to the appropriate Diagnostic & Testing

article.

Common communication problems include:

- Two transponder keys too close to each other.
- Another transponder device (i.e.: Speed Pass) too close to the Sentry Key transponder.
- Transponder too close to a cellular phone.
- A cellular phone charger in the vehicle causing interference.

A security indicator illuminated solid (not flashing) in the IC indicates that there is a SKIS system failure such as:

- Loss of PCM/CAN data bus communication.
- Failed antenna circuit.

NOTE: **After a RFHM is replaced with a new unit, the Sentry Key transponders need to be programmed to the new RFHM. Follow the instructions found in the diagnostic scan tool for the Replace RFHM Routine . The Sentry Key transponders and the Remote Keyless Entry (RKE) transmitters (if equipped) will both be programmed during this operation. There is no need to program the RKE transmitter again once the Sentry Key transponder key has been programmed to the new RFHM.**

NOTE: **When a PCM and the RFHM are replaced at the same time, perform the following steps in order:**

- **Program the new PCM.**
- **Program the new RFHM.**

  Program all Sentry Key transponders to the new RFHM.

MODULE, SENTRY KEY IMMOBILIZER (SKIM)

DESCRIPTION

DESCRIPTION

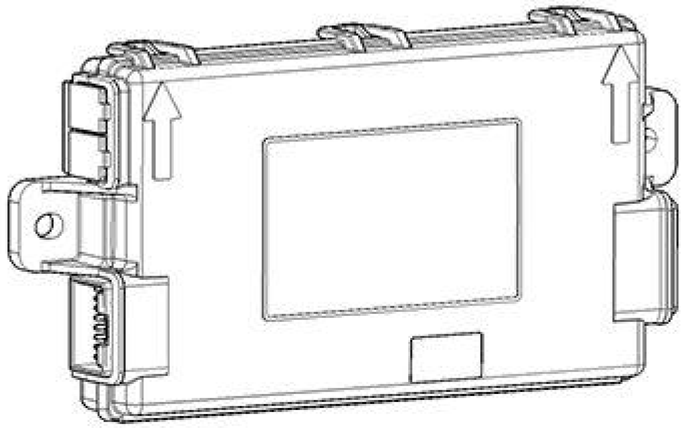

Fig. 2: Radio Frequency Hub Module
Courtesy of CHRYSLER GROUP, LLC

The functions and features of the Sentry Key Immobilizer Module (SKIM) (also previously known as the Sentry Key REmote Entry Module/SKREEM, the Wireless Control Module/WCM or the Wireless Ignition Node/WIN) are all integral to the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) (2) and the Keyless Ignition Node (KIN) in this vehicle.

The RFHM is the primary component of the Sentry Key Immobilizer System (SKIS). It is also the receiver for the Remote Keyless Entry (RKE) system, the Keyless Go (KG) system, the Passive Entry (PE) system and the Remote Start system on vehicles so equipped. The RFHM is located near the center of the shelf support behind the rear seat back and is concealed beneath the package tray interior trim. Refer to **MODULE, RADIO FREQUENCY (RF HUB), DESCRIPTION** .

The KIN includes the integral ignition switch push button. The KIN is located in the instrument panel, just to the right of the steering column. The remainder of the KIN including its mounting provisions and electrical connections are concealed within the instrument panel. Refer to **MODULE, KEYLESS IGNITION NODE, DESCRIPTION** .

OPERATION

OPERATION

The functions and features of the Sentry Key Immobilizer Module (SKIM) (also previously known as the Sentry Key REmote Entry Module/SKREEM, the Wireless Control Module/WCM or the Wireless Ignition Node/WIN) are all integral to the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) and the Keyless Ignition Node (KIN) in this vehicle. The RFHM contains a Radio Frequency (RF) transceiver and a microcontroller. The RFHM transmits Low Frequency (LF) signals to, and receives LF signals from the Sentry Key transponder integral to the FOB with Integrated Key (FOBIK) through a tuned antenna internal to the RFHM housing. The KIN allows the vehicle operator to select and monitor the status of the ignition switch and also transmits the selected ignition switch status to the RFHM.

The RFHM also serves as the Remote Keyless Entry (RKE) RF receiver and, if the vehicle is so equipped, the

receiver for the remote start system. Refer to **DESCRIPTION** . The RFHM communicates over the Controller Area Network (CAN) data bus with the Body Control Module (BCM) (also known as the Common Body Controller/CBC), the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC), the Powertrain Control Module (PCM) (also known as the Engine Control Module/ECM) or the diagnostic scan tool. It also communicates over a dedicated Local Interface Network (LIN) data bus circuit with the KIN.

The RFHM and the PCM both use software that includes a rolling code algorithm strategy, which helps to reduce the possibility of unauthorized Sentry Key Immobilizer System (SKIS) disarming. The rolling code algorithm ensures security by preventing an override of the SKIS through the unauthorized substitution of the RFHM or the PCM. However, the use of this strategy also means that replacement of either the RFHM or the PCM units will require a system initialization procedure to restore system operation.

The RFHM retains in memory the ID numbers of any Sentry Key FOBIK transponder that is programmed into it. A maximum of eight Sentry Key FOBIK transponders can be programmed into the RFHM. For added system security, each RFHM is programmed with a unique Secret Key code. This code is stored in memory, sent over the CAN data bus to the PCM, and is encoded to the transponder of every Sentry Key FOBIK that is programmed into the RFHM. Therefore, the Secret Key code is a common element that is found in every component of the SKIS.

Another security code called a PIN is used to gain access to the RFHM Secured Access Mode. The Secured Access Mode is required during service to perform the SKIS initialization and Sentry Key FOBIK transponder programming procedures. The RFHM also stores the Vehicle Identification Number (VIN) in its memory, which it learns through a CAN data bus message from the PCM during SKIS initialization.

In the event that a RFHM replacement is required, the Secret Key code can be transferred to the new RFHM from the PCM using the diagnostic scan tool and the SKIS initialization procedure. Proper completion of the SKIS initialization will allow the existing Sentry Key FOBIK units to be programmed into the new RFHM so that new FOBIK units will not be required. In the event that the original Secret Key code cannot be recovered, RFHM replacement will also require new Sentry Key FOBIK units. The diagnostic scan tool will alert the technician during the SKIS initialization procedure if new Sentry Key FOBIK units are required. Refer to **STANDARD PROCEDURE** .

When the status of the ignition switch transitions to On, the RFHM transmits a LF signal to excite the transponder in the FOBIK. The RFHM then waits for a RF signal response from the transponder. If the response received identifies the FOBIK as valid, the RFHM sends an electronic **valid key** message to the PCM over the CAN data bus. If the response received identifies the FOBIK as invalid or if no response is received from the FOBIK transponder, the RFHM sends an **invalid key** message to the PCM. The PCM will enable or disable engine operation based upon the status of the RFHM messages. It is important to note that the default condition in the PCM is an **invalid key** ; therefore, if no message is received from the RFHM by the PCM, the engine will be disabled and the vehicle immobilized after two seconds of running.

The RFHM also sends electronic **security indicator** request messages to the IC over the CAN data bus to tell the IC how to operate the security indicator. The **security indicator** request message from the RFHM tells the IC to turn the indicator On for about three seconds each time the status of the ignition switch transitions to On as a bulb test. After completion of the bulb test, the RFHM sends **security indicator** request messages to the IC to turn the indicator Off, turn the indicator On or to flash the indicator On and Off. If the security indicator flashes or stays On solid after the bulb test, it signifies a SKIS fault. If the RFHM detects a system malfunction or the SKIS has become ineffective, the security indicator will stay On solid. If the RFHM detects an invalid FOBIK or if a FOBIK transponder-related fault exists, the security indicator will flash.

The SKIS performs a self-test each time the status of the ignition switch transitions to On, and will store fault information in the form of a Diagnostic Trouble Code (DTC) in RFHM memory if a system malfunction is detected. The hard wired circuits of the RFHM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the RFHM or the electronic controls and communication between other modules and devices that provide some features of the SKIS. The most reliable, efficient and accurate means to diagnose the RFHM or the electronic controls and communication related to RFHM operation requires the use of a diagnostic scan tool.

SWITCH, HOOD AJAR

DESCRIPTION

DESCRIPTION

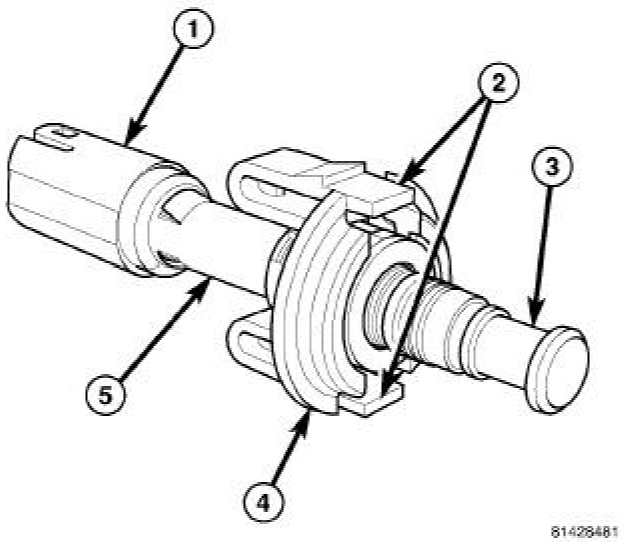

Fig. 3: Hood Ajar Switch
Courtesy of CHRYSLER GROUP, LLC

The hood ajar switch is a normally closed, single pole, spring-loaded plunger actuated switch. This switch has two unique versions that are used in two different applications. One switch is used only on vehicles equipped with the Vehicle Theft Security System (VTSS) for sale in certain export markets where Vehicle Theft Alarm (VTA) perimeter protection of the under hood area is required equipment. The second switch is used only on domestic vehicles equipped with an optional remote start system.

The molded plastic switch body (5) has an integral molded connector receptacle (1) on the lower end containing two terminal pins. The switch is connected to the vehicle electrical system through a dedicated take out of the headlamp and dash wire harness. Two integral latches (2) lock the switch into a keyed mounting hole in the stamped steel Powertrain Control Module (PCM) (also known as the Engine Control Module/ECM) mounting bracket. The PCM mounting bracket is secured to the upper radiator cross member near the left fender ledge within the engine compartment. The underside of the hood panel inner reinforcement actuates the switch plunger as the hood panel is closed.

The switch plunger (3) extends through a mounting collar (4) and a sleeve-like retainer ring on the upper end of

the switch body. The retainer ring has a one time, self-adjustment feature that is activated after the switch is installed by closing the hood. The retainer ring is also color-coded to aid in identifying the switch application. A dark brown retainer ring identifies the under hood security switch application, while a white retainer ring identifies the remote start system application.

An installed hood ajar switch cannot be readjusted or repaired. If the switch is damaged, ineffective, or requires readjustment, it must be replaced with a new unit.

OPERATION

OPERATION

The hood ajar switch is a normally closed switch. The switch is held open by the inner hood panel reinforcement when the spring-loaded switch plunger is depressed whenever the hood panel is closed and latched. When the hood is opened, the spring-loaded switch plunger extends from the switch body and the switch contacts are closed. The switch is connected in series between a return circuit and a signal circuit of the Body Control Module (BCM) (also known as the Common Body Controller/CBC). The BCM uses an internal resistor pull up to monitor the state of the hood ajar switch contacts. The BCM continually monitors this circuit and will store a Diagnostic Trouble Code (DTC) for any fault that it detects.

The components of the switch self-adjustment feature include an integral stop on the shaft of the plunger and a ribbed, adjusting sleeve at the top of the switch body from which the plunger extends. With the switch mounting collar secured in its mounting bracket, the plunger is depressed by the hood inner reinforcement as the hood is closed. As the plunger is depressed, the plunger stop contacts the top of the sleeve and the sleeve is driven downward, ratchet-like through the switch mounting collar until the hood is fully closed and latched. The ribs on the sleeve are engaged within the mounting collar to maintain this adjusted position.

The hood ajar switch as well as the hard wired circuits between the switch and the BCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication between modules and other devices related to hood ajar switch operation that provide some features of the domestic remote start system. The most reliable, efficient and accurate means to diagnose the electronic controls and communication related to hood ajar switch operation requires the use of a diagnostic scan tool. Refer to the appropriate Diagnostic & Testing article.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HOOD AJAR SWITCH

The hood ajar switch as well as the hard wired circuits between the switch and the Body Control Module (BCM) (also known as the Common Body Controller/CBC) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication between modules and other devices related to hood ajar switch operation that provide some features of the domestic remote start system. The most reliable, efficient and accurate means to diagnose the electronic controls and communication related to hood ajar switch operation requires the use of a diagnostic scan tool. Refer to the appropriate Diagnostic & Testing article.

REMOVAL

REMOVAL

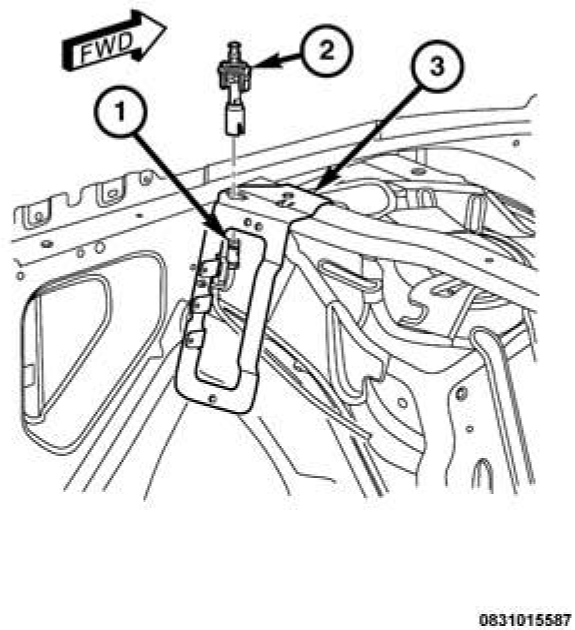

Fig. 4: Identifying Powertrain Control Module Mounting Bracket, Hood Ajar Switch & Wire Harness Connector
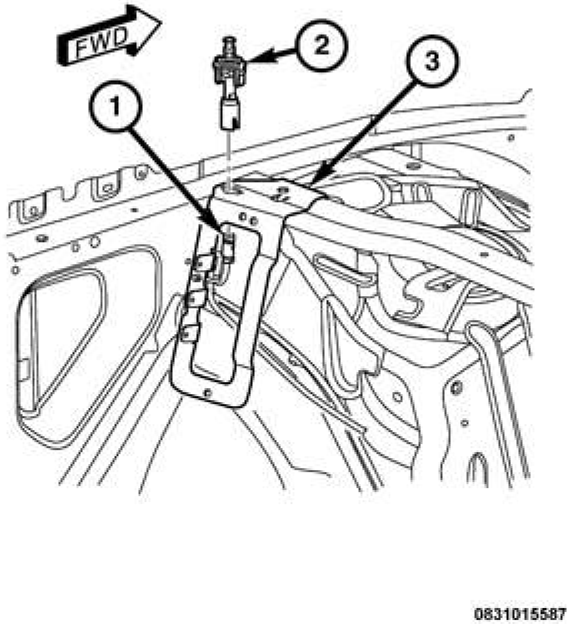
Courtesy of CHRYSLER GROUP, LLC

1. Unlatch and open the hood.
2. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery.
3. Working from the top of the Powertrain Control Module (PCM) (also known as the Engine Control Module/ECM) mounting bracket (3) on the upper radiator cross member, squeeze the two hood ajar switch (2) latch tabs together far enough to pull the switch upward.
4. Pull the hood ajar switch up through the hole in the PCM mounting bracket far enough to access and disconnect the headlamp and dash wire harness connector (1) from the switch connector receptacle.
5. Remove the hood ajar switch from the vehicle.

INSTALLATION

INSTALLATION



[Fig. 5: Identifying Powertrain Control Module Mounting Bracket, Hood Ajar Switch & Wire Harness Connector](#)
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Self-adjustment of the hood ajar switch is a one time feature. If the switch is damaged, ineffective, removed or requires readjustment, it must be replaced with a new unit.**

1. Position the hood ajar switch (2) near the switch mounting hole in the Powertrain Control Module (PCM) (also known as the Engine Control Module/ECM) mounting bracket (3) on the upper radiator cross member.
2. Pull the headlamp and dash wire harness connector (1) through the switch mounting hole and reconnect it to the switch connector receptacle.
3. From the top of the mounting bracket, press the switch downward into the mounting hole until the two integral switch latch tabs lock it into place.
4. Reconnect the negative cable to the battery. If equipped with an Intelligent Battery Sensor (IBS), reconnect the IBS connector.
5. Close and latch the hood. This will set the hood ajar switch self-adjusting plunger to the proper height.

GENERAL INFORMATION

Wheel Alignment Theory & Operation

* PLEASE READ THIS FIRST *

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

PRE-ALIGNMENT INSTRUCTIONS

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

GENERAL ALIGNMENT CHECKS

Before adjusting wheel alignment, check the following:

- Each axle uses tires of same construction and tread style, equal in tread wear and overall diameter. Verify that radial and axial runout is not excessive. Inflation should be at manufacturer's specifications.
- Steering linkage and suspension must not have excessive play. Check for wear in tie rod ends and ball joints. Springs must not be sagging. Control arm and strut rod bushings must not have excessive play. See **Fig. 1**.

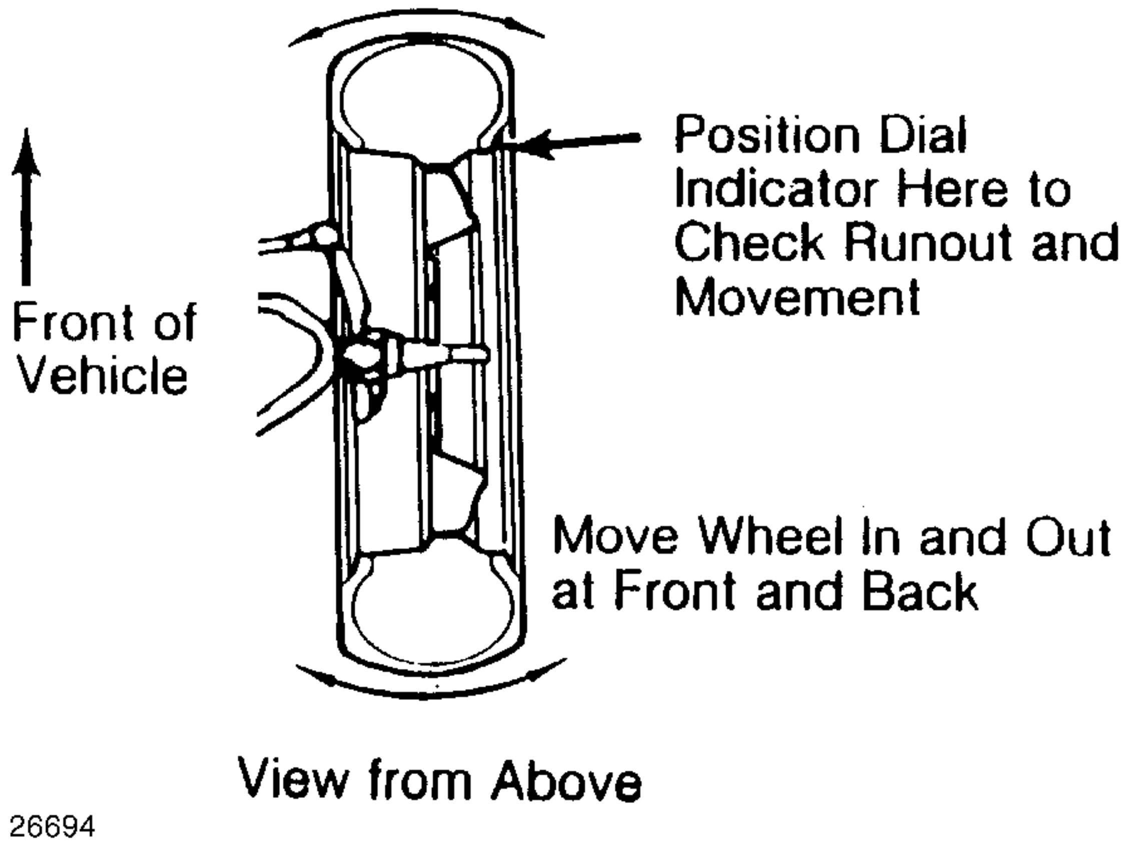

Fig. 1: Checking Steering Linkage

- Vehicle must be on level floor with full fuel tank, no passenger load, spare tire in place and no load in trunk. Bounce front and rear end of vehicle several times. Confirm vehicle is at normal riding height.
- Steering wheel must be centered with wheels in straight ahead position. If required, shorten one tie rod adjusting sleeve and lengthen opposite sleeve (equal amount of turns). See **Fig. 2**.
- Wheel bearings should have the correct preload and lug nuts must be tightened to manufacturer's specifications. Adjust camber, caster and toe-in using this sequence. Follow instructions of the alignment equipment manufacturer.

CAUTION: **DO NOT attempt to correct alignment by straightening parts. Damaged parts MUST be replaced.**

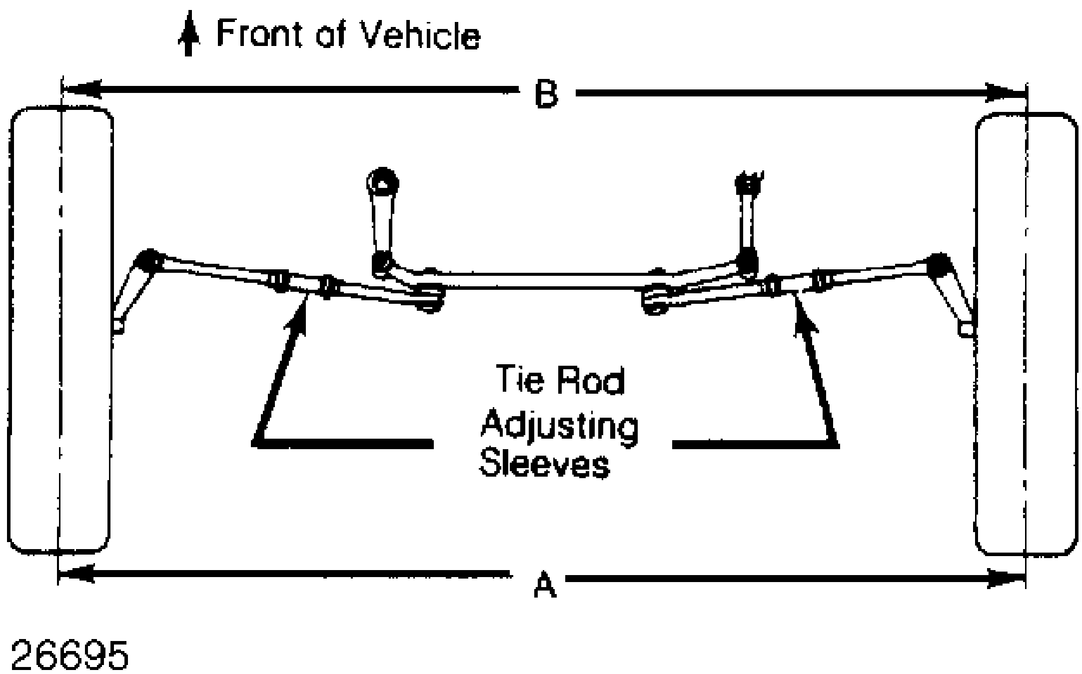

Fig. 2: Adjusting Tie Rod Sleeves (Top View)

ADJUSTMENTS

NOTE:	**This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

CAMBER

1. Camber is the tilting of the wheel, outward at either top or bottom, as viewed from front of vehicle. See **Fig. 3**.
2. When wheels tilts outward at the top (from centerline of vehicle), camber is positive. When wheels tilt inward at top, camber is negative. Amount of tilt is measured in degrees from vertical.

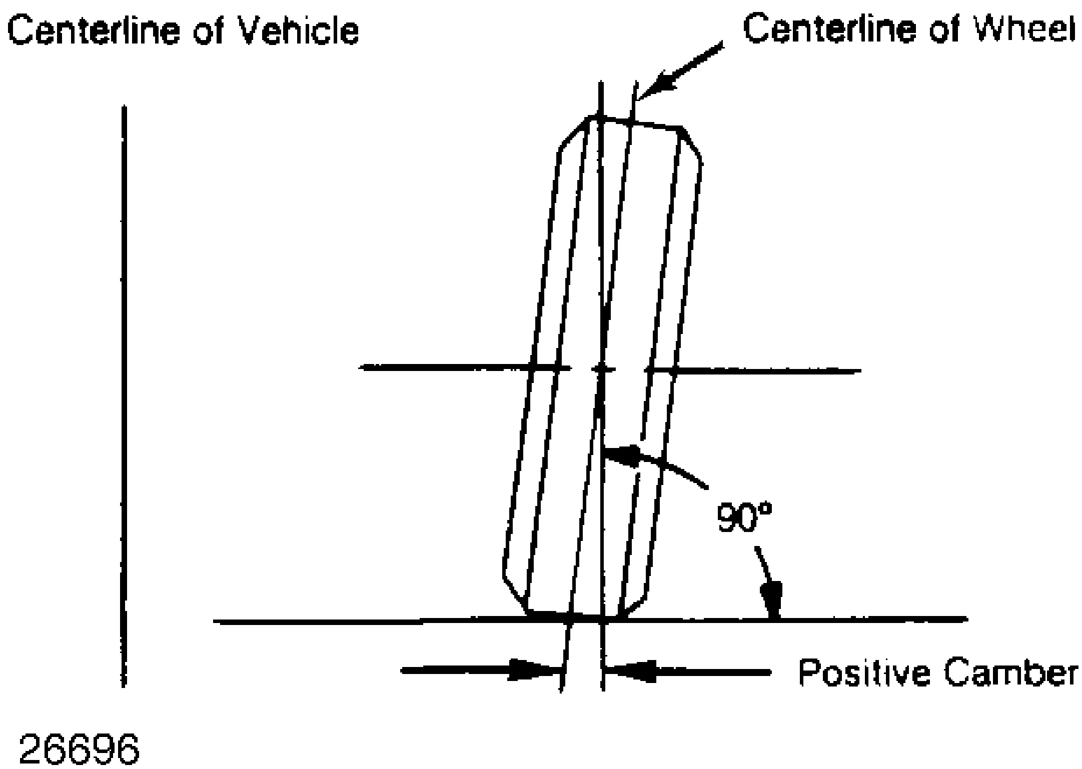

Fig. 3: Determining Camber Angle

CASTER

1. Caster is tilting of front steering axis either forward or backward from vertical, as viewed from side of vehicle. See **Fig. 4**.
2. When axis is tilted backward from vertical, caster is positive. This creates a trailing action on front wheels. When axis is tilted forward, caster is negative, causing a leading action on front wheels.

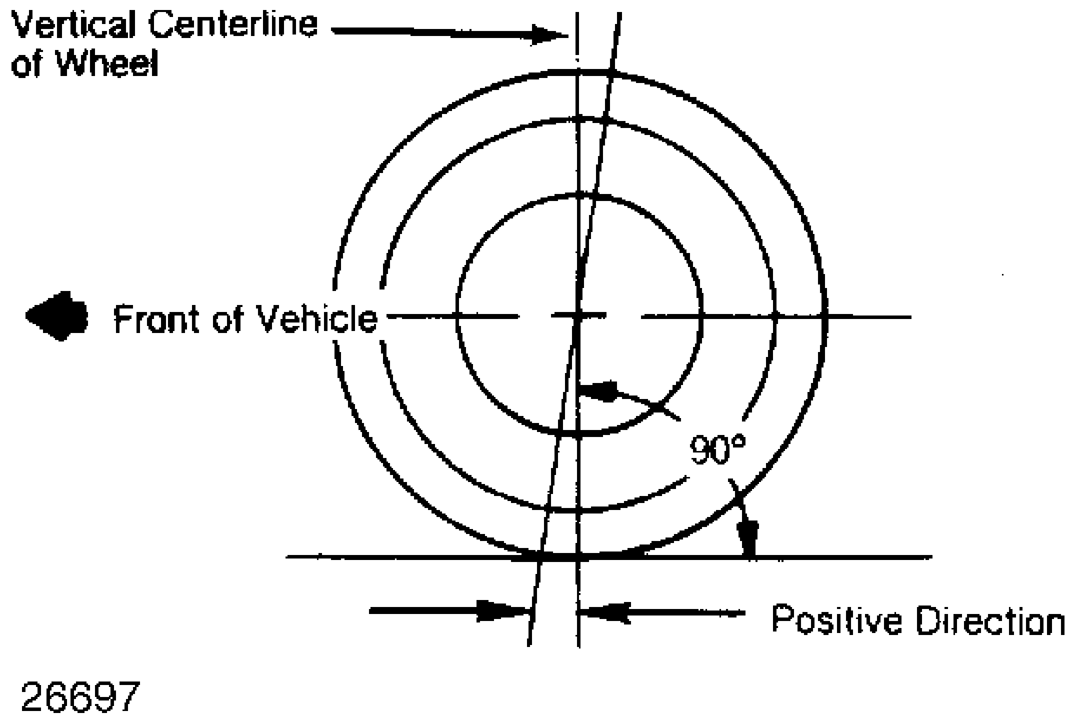

Fig. 4: Determining Caster Angle

TOE-IN ADJUSTMENT

Toe-in is the width measured at the rear of the tires subtracted by the width measured at the front of the tires at about spindle height. A positive figure would indicate toe-in and a negative figure would indicate toe-out. If the distance between the front and rear of the tires is the same, toe measurement would be zero. To adjust:

1) Measure toe-in with front wheels in straight ahead position and steering wheel centered. To adjust toe-in, loosen clamps and turn adjusting sleeve or adjustable end on right and left tie rods. See **Fig. 2** and **Fig. 5** .

2) Turn equally and in opposite directions to maintain steering wheel in centered position. Face of tie rod end must be parallel with machined surface of steering rod end to prevent binding.

3) When tightening clamps, make certain that clamp bolts are positioned so there will be no interference with other parts throughout the entire travel of linkage.

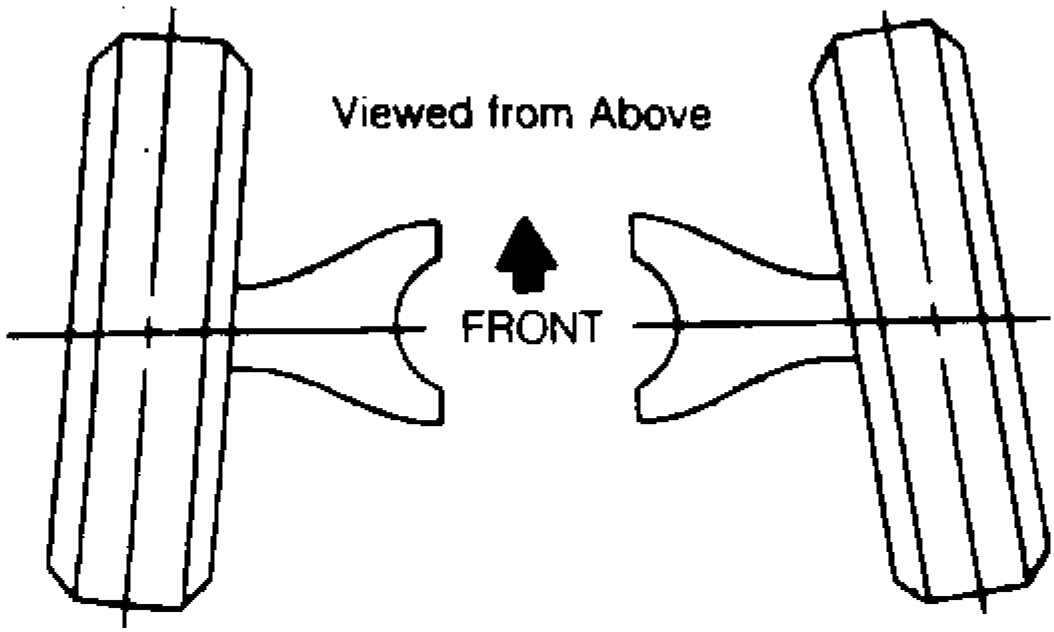

Fig. 5: Wheel Toe-In (Dimension A Less Dimension B)

TOE-OUT ON TURNS

1. Toe-out on turns (turning radius) is a check for bent or damaged parts, and not a service adjustment. With caster, camber, and toe-in properly adjusted, check toe-out with weight of vehicle on wheels.
2. Use a full floating turntable under each wheel, repeating test with each wheel positioned for right and left turns. Incorrect toe-out generally indicates a bent steering arm. Replace arm, if necessary, and recheck wheel alignment.

STEERING AXIS INCLINATION

1. Steering axis inclination is a check for bent or damaged parts, and not a service adjustment. Vehicle must be level and camber should be properly adjusted. See **Fig. 6**.
2. If camber cannot be brought within limits and steering axis inclination is correct, steering knuckle is bent. If camber and steering axis inclination are both incorrect by approximately the same amount, the upper and lower control arms are bent.

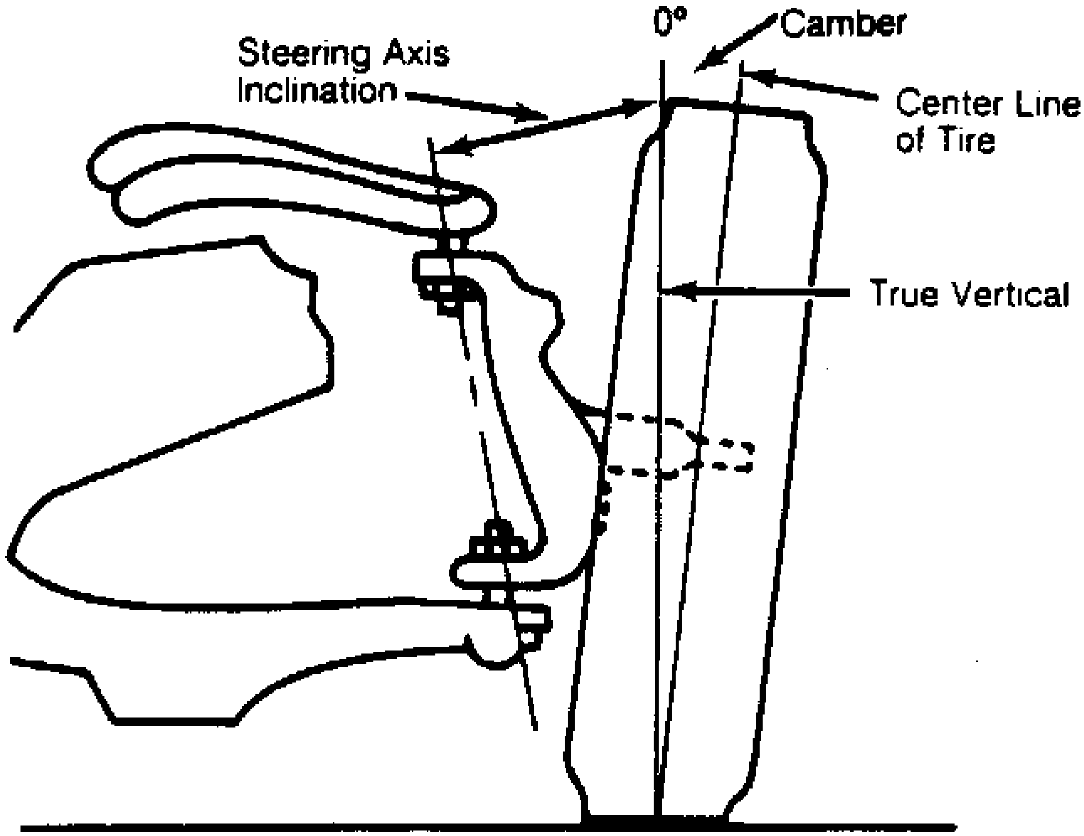

Fig. 6: Checking Steering Axis Inclination

Article GUID: A00060716

Wiper System & Washer System - Service Information - Challenger

DESCRIPTION

DESCRIPTION

An electrically operated intermittent wiper and washer system is standard factory installed safety equipment on this vehicle. The wiper and washer system includes the following major components, which are described in further detail elsewhere within this service information:

- **Washer Fluid Level Switch** - The washer fluid level switch is located in a dedicated hole on the lower, outboard side of the washer reservoir, ahead of the right front wheel house splash shield.
- **Washer Nozzle** - Two fluidic washer nozzles with integral check valves are secured by latch features to dedicated openings in the hood panel inner reinforcement near the rear hem of the hood panel below the base of the windshield.
- **Washer Pump/Motor** - The electric washer pump/motor unit is located in a dedicated hole in a sump area on the lower, outboard side of the washer reservoir, ahead of the right front wheel house splash shield.
- **Washer Plumbing** - The plumbing for the washer system consists of rubber hoses, hard plastic tubes and molded rubber or plastic fittings. The plumbing is routed to the dash panel from the washer reservoir along the outboard side of the right front load beam. The washer hose is routed along the right hood hinge to the hood, then across the underside of the hood panel to the washer nozzles.
- **Washer Reservoir** - The washer reservoir is concealed between the right inner fender shield and the right outer fender panel, ahead of the right front wheel house splash shield. The filler neck and cap are the only visible components of the reservoir and, can be easily accessed from the right front corner of the engine compartment.
- **Wiper Arms And Blades** - The two wiper arms are secured with nuts to the threaded ends of the two wiper pivot shafts, which extend through the cowl plenum cover/grille panel located near the base of the windshield. The two wiper blades are each secured to their wiper arm with an integral latch, and are parked on the glass near the bottom of the windshield when the wiper system is not in operation. The left and right wiper arms and wiper blades are unique and are not interchangeable.
- **Wiper Linkage Module** - The wiper pivot shafts are the only visible components of the wiper linkage module. The remainder of the module is concealed beneath the cowl plenum cover/grille panel. The wiper module includes the wiper module bracket, three rubber-isolated wiper module mounts, the wiper motor, the wiper motor crank arm, the two wiper drive links and the two wiper pivots.
- **Wiper Relays** - The wiper high and low relay and the wiper on and off relay are both International Standards Organization (ISO) micro relays located within the front Power Distribution Center (PDC). The front PDC is located on the right front wheel house ahead of the right strut tower within the engine compartment.

Certain functions and features of the wiper and washer systems rely upon resources shared with other electronic modules in the vehicle over a Local Interface Network (LIN) data bus as well as over the Controller Area Network (CAN) data bus. Other electronic modules in the vehicle that may affect wiper and washer system operation are:

- **Body Control Module** - The Body Control Module (BCM) (also known as the Common Body Controller/CBC) is located beneath the instrument panel on the passenger side of the vehicle. Refer to **MODULE, BODY CONTROL, DESCRIPTION** .
- **Light Rain Sensor Module** - A Light Rain Sensor Module (LRSM) (also known as the Light Sensor Module/LSM, the Rain Sensor Module/RSM or the Rain Light Sensor/RLS) is used on vehicles equipped with the optional automatic wiper feature. The LRSM is located on a bracket bonded to the inside surface of the windshield glass, near the inside rear view mirror mount.
- **Multifunction Switch** - The multifunction switch is integral to the Steering Column Control Module (SCCM) along with the clockspring and the SCCM microcontroller on the top of the steering column just below the steering wheel. The multifunction switch is connected to the SCCM microcontroller. Only the switch control stalk extending from the left side of the steering column is visible, while the remainder of the switch is concealed beneath the steering column shrouds. The multifunction switch provides all of the driver controls for both the wiper and washer systems.
- **Steering Column Control Module** - The Steering Column Control Module (SCCM) includes the microcontroller, the multifunction switch and the clockspring on the top of the steering column just below the steering wheel. The SCCM microcontroller is completely concealed beneath the steering column shrouds. Refer to **MODULE, STEERING COLUMN CONTROL, DESCRIPTION** .

The BCM and the SCCM each contain a microcontroller and programming that allow them to communicate with each other and other electronic modules in the vehicle using the Controller Area Network (CAN) data bus. In addition the BCM and the RLSM communicate with each other using the Local Interface Network data bus. Refer to **COMMUNICATION, DESCRIPTION** .

Hard wired circuitry connects the wiper and washer system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the wiper and washer system components through the use of a combination of soldered splices, splice block connectors and many different types of wire harness terminal connectors and insulators. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OPERATION

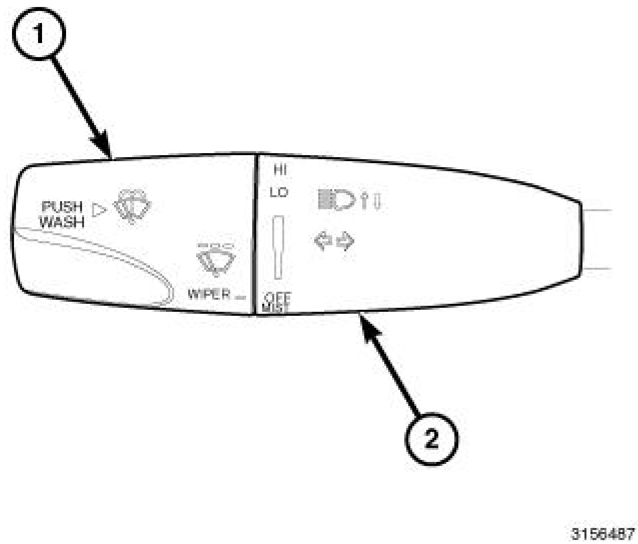

Fig. 1: Control Knob & Control Stalk
Courtesy of CHRYSLER GROUP, LLC

The wiper and washer system is designed to provide the vehicle operator with a convenient, safe and reliable means of maintaining visibility through the windshield glass. The various components of this system are designed to convert electrical energy produced by the vehicle electrical system into the mechanical action of the wiper blades to wipe the outside surface of the glass, as well as into the hydraulic action of the washer system to apply washer fluid stored in an on-board reservoir to the area of the glass to be wiped. When combined, these components provide the means to effectively maintain clear visibility for the vehicle operator by removing excess accumulations of rain, snow, bugs, mud or other minor debris from the outer surface of the windshield glass that might be encountered while driving the vehicle under numerous types of inclement operating conditions.

The vehicle operator initiates all wiper and washer system functions with the control knob (1) on the control stalk (2) of the multifunction switch that extends from the left side of the steering column, just below the steering wheel. Rotating the control knob on the end of the control stalk, selects the Off, Delay (except with the optional automatic or rain-sensing wiper system), Automatic (**A**) (with the optional automatic or rain-sensing wiper system only), Low or High wiper system operating modes. In the Delay mode, the control knob also allows the vehicle operator to select from one of four intermittent wipe Delay intervals. With the Automatic wiper system, the control knob allows the vehicle operator to select from one of four automatic wiper sensitivity levels.

Depressing the control knob towards the steering column actuates the momentary washer system switch, which selects the Wash and Wipe-After-Wash modes depending upon when and how long the switch is held closed. Rotating the control knob downward actuates another momentary switch and selects the Mist mode, which cycles the wiper blades for as long as the switch is held closed then completes the current cycle and parks the blades at the base of the windshield after the control knob is released.

The multifunction switch provides hard wired analog and digital inputs to the microcontroller internal to the Steering Column Control Module (SCCM) for all of the wiper and washer system functions. The SCCM microcontroller then sends electronic **wiper switch** and **washer switch** status messages to the Body Control Module (BCM) (also known as the Common Body Controller/CBC) over the Controller Area Network (CAN) data bus requesting the appropriate wiper and washer system operating modes.

Wiper and washer system operation is completely controlled by the SCCM and BCM logic circuits, and that logic will only allow these systems to operate when the status of the ignition switch is Accessory or On. The BCM uses intelligent, high current, self-protected high side switches to control wiper relays within the front Power Distribution Center (PDC). The relays control wiper system operation by energizing or de-energizing the wiper motor low and high speed brushes. The multifunction switch circuitry receives battery current and a clean ground output from the SCCM microcontroller, then provides analog and digital inputs to the microcontroller to indicate the selected wiper and washer system mode.

The hard wired circuits and components of the wiper and washer system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication between other modules and devices that provide some features of the wiper and washer system. The most reliable, efficient and accurate means to diagnose the wiper and washer system or the electronic controls and communication related to wiper and washer system operation requires the use of a diagnostic scan tool. Refer to the appropriate Diagnostic & Testing article.

OPERATING MODES

Following are paragraphs that briefly describe the operation of each of the wiper and washer system operating modes.

- **Automatic Wipe Mode** - If the vehicle is equipped with the optional automatic (rain sensing) wiper system and it is enabled, when the control knob on the control stalk of the multifunction switch is moved to one of the four sensitivity positions, the SCCM microcontroller sends an electronic **wiper switch sensitivity** message to the BCM over the CAN data bus. The BCM, which is also a Local Interface Network (LIN) data bus master node, relays the **wiper switch sensitivity** message to the Light Rain Sensor Module (LRSM) (also known as the Light Sensor Module/LSM or Rain Sensor Module/RSM), which is a LIN slave node, over the LIN data bus.

  The LRSM monitors an area within the wipe pattern of the windshield glass for the accumulation of moisture. Based upon internal programming and the selected sensitivity level, when sufficient moisture has accumulated the LRSM sends the appropriate electronic **wipe command** messages back to the BCM over the LIN data bus. Then the BCM operates the wiper system accordingly.

  As the sensitivity level is set higher, the LRSM is more sensitive to moisture accumulation and will send **wipe commands** more frequently. The third sensitivity position of the control knob is designed to provide optimal wiper performance for most typical driving requirements. The BCM logic is also programmed to provide an immediate wipe cycle each time the control knob on the control stalk of the multifunction switch is moved from the Off position to one of the four sensitivity positions, and another immediate wipe cycle each time the control knob is moved from a lower sensitivity position to a higher sensitivity position.

  Also, if a vehicle is equipped with automatic wipers but the feature has been disabled using the Customer Programmable Features function of the Settings menu, when any sensitivity position is selected with the control knob the system will respond in the same manner as in the intermittent wipe mode.

  The automatic wiper system also has features designed to protect the mechanical components of the wiper system, and will not allow automatic wiper operation under the following conditions:

- **Low Ambient Temperature** - When the ambient temperature is below 0Â° C (32Â° F), the automatic wipers will not operate during a new ignition cycle until the wiper switch has been moved to a different position than that which was selected at the moment the current ignition cycle began, or until a vehicle speed input is detected.
- **Transmission In Neutral** - When the transmission gear selector is placed in the Neutral (**N**) position while the status of the ignition switch is On, the automatic wipers will not operate during the current ignition cycle until the wiper switch has been moved to a different position than that which was selected at the moment the Neutral position was selected, until the vehicle speed is greater than 8 kilometers-per-hour (5 miles-per-hour) or until the transmission gear selector is moved out of the Neutral position, whichever occurs first.

- **Continuous Wipe Mode** - When the Low position of the control knob on the control stalk of the multifunction switch is selected the SCCM microcontroller sends an electronic **wiper switch low** status message to the BCM over the CAN data bus. The BCM then provides the appropriate outputs to the wiper on-off and wiper high-low relays within the front PDC to direct battery current to the low speed brush of the wiper motor, causing the wipers to cycle at low speed.

  When the High position of the control knob is selected the SCCM microcontroller sends an electronic **wiper switch high** status message to the BCM. The BCM then provides the appropriate outputs to the wiper on-off and wiper high-low relays within the front PDC to direct battery current to the high speed brush of the wiper motor, causing the wipers to cycle at high speed.

  When the Off position of the multifunction switch control knob is selected, the SCCM microcontroller sends an electronic **wiper switch off** status message to the BCM, then one of two events will occur. The event that occurs depends upon the position of the wiper blades on the windshield at the moment that the control knob Off position is selected.

  If the wiper blades are in the down position on the windshield when the Off position is selected, the park switch that is integral to the wiper motor is closed to ground, which provides a hard wired park switch sense input to the BCM. The BCM provides the appropriate outputs to the wiper on-off and wiper high-low relays within the front PDC to de-energize the wiper motor and the wiper motor ceases to operate.

  If the wiper blades are not in the down position on the windshield at the moment the Off position is selected, the park switch is an open circuit and the BCM provides the appropriate outputs to the wiper on-off and wiper high-low relays within the front PDC to continue running the wiper motor at low speed until the wiper blades are in the down position on the windshield and the park switch input to the BCM is again closed to ground.

- **Headlamps On With Wipers Mode** - The circuitry and programming of the BCM provides an automatic Headlamps On With Wipers mode for vehicles equipped with the optional automatic headlamps. This is a Customer Programmable Feature that can be enabled or disabled through the Settings menu. If this feature is enabled, when the headlamp switch is in the Automatic (**A**) position, the headlamps will turn On automatically whenever the windshield wipers are turned On; and, if the headlamps were turned On automatically when the wipers were turned On, they will also turn Off automatically when the wipers are turned Off.

  If this feature is enabled in vehicles equipped with the optional automatic (rain sensing) wiper feature, when the automatic wiper mode is selected the headlamps will turn On automatically only after the wipers complete three automatic wipe cycles within about 30 seconds, and they will turn Off

automatically after 3 minutes elapse without any automatic wipe cycles unless ambient light conditions dictate otherwise.

- **Intermittent Wipe Mode** - The following applies to vehicles not equipped with the optional automatic (rain sensing) wiper system, or to vehicles equipped with the automatic (rain sensing) wiper system that have been disabled using the Customer Programmable Features function of the Settings menu.

  When the control knob on the control stalk of the multifunction switch is moved to one of the four Delay (Intermittent) interval positions the SCCM microcontroller sends an electronic **wiper switch delay interval** status message to the BCM. Then the BCM electronic intermittent wipe logic circuit responds by calculating the correct length of time between wiper sweeps based upon the selected delay interval input.

  The BCM monitors the changing state of the wiper motor park switch through a hard wired park switch sense input. This input allows the BCM to determine the proper intervals at which to provide the appropriate outputs to the wiper on-off and high-low relays within the front PDC to energize and de-energize the wiper motor low speed brush to operate the wiper motor intermittently for one low speed cycle at a time.

  The BCM logic is also programmed to provide vehicle speed sensitivity to the selected intermittent wipe delay intervals. In order to provide this feature, the BCM monitors electronic **vehicle speed** messages from the Controller Antilock Brake (CAB) (also known as the Antilock Brake Module/ABM, the Antilock Brake System/ABS module or the Electronic Stability Control/ESC module) and doubles the selected delay interval whenever the vehicle speed is about 16 kilometers-per-hour (10 miles-per-hour) or less.

- **Mist Wipe Mode** - When the control knob of the multifunction switch is rotated downward to the momentary Mist position, the SCCM microcontroller sends an electronic **wiper mist mode** status message to the BCM. The BCM then provides the appropriate outputs to the wiper on-off and wiper high-low relays within the front PDC to energize the low speed brush of the wiper motor for as long as the switch is held closed, then de-energize the motor when the state of the Mist switch changes to open, parking the wiper blades near the base of the windshield. The BCM can operate the wiper motor in this mode for only one low speed cycle at a time, or for an indefinite number of sequential low speed cycles, depending upon how long the Mist switch is held closed.
- **Wash Mode** - When the control knob of the multifunction switch is depressed toward the steering column to the momentary Wash position for more than about one-half second with the wiper system operating, the SCCM microcontroller sends an electronic **washer switch** status message to the BCM. Then the BCM directs battery current and ground to the washer pump/motor. This will cause the washer pump/motor to be energized for as long as the switch is held closed (up to approximately 10 seconds) and to be de-energized when the control knob is released.

  When the control knob is depressed to the momentary Wash position while the wiper system is operating in one of the Delay interval (or sensitivity level with automatic or rain sensing wipers) positions, the washer pump/motor operation is the same. However, the BCM logic also overrides the selected delay interval or sensitivity level and operates the wiper motor in a continuous low speed mode for as long as the control knob is held in the momentary Wash position, then reverts to the selected delay interval or sensitivity level several wipe cycles after the control knob is released. If the Wash switch is held closed for more than about 10 seconds, the BCM will suspend washer pump/motor operation until the control knob is released for about 2 seconds, then is cycled back to the Wash position.

- **Wipe-After-Wash Mode** - When the control knob of the multifunction switch is depressed toward the steering column to the momentary Wash position for more than about one-half second while the wiper system is not operating, the SCCM microcontroller sends an electronic **washer switch** status message to the BCM. Then the BCM directs battery current and ground to operate the washer pump/motor and provides the appropriate outputs to the wiper on-off and wiper high-low relays within the front PDC to energize the wiper motor in a continuous low speed mode for as long as the switch is held closed (up to approximately 10 seconds). When the control knob is released, the BCM de-energizes the washer pump/motor immediately, but allows the wiper motor to operate for two or three additional wipe cycles before it de-energizes the wiper motor and parks the wiper blades near the base of the windshield.

  If the control knob is held inward for more than about 10 seconds, the BCM will suspend washer pump/motor operation until the knob is released for about 2 seconds and then is cycled back to the Wash position; however, the wipers will continue to operate for as long as the switch is held closed. The BCM monitors the changing state of the wiper motor park switch through a hard wired wiper park switch sense circuit input. This input allows the BCM to count the number of wipe cycles that occur after the control knob is released, and to determine the proper interval at which to de-energize the wiper motor to complete the Wipe-After-Wash mode cycle.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - WIPER AND WASHER SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

If the wiper motor operates, but the wiper blades do not move on the windshield and the wiper arms are properly installed, replace the ineffective wiper motor or wiper linkage module. If the washer pump/motor operates, but no washer fluid is dispensed on the glass; or, if the wipers operate, but chatter, lift, or do not clear the glass, clean and inspect the wiper and washer system components as required. Refer to **CLEANING** and **INSPECTION**.

The hard wired wiper and washer system circuits and components may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the wiper and washer system or the electronic controls and communication between other modules and devices that provide some features of the wiper and washer system. The most reliable, efficient and accurate means to diagnose the wiper and washer system or the electronic controls and communication related to wiper and washer system operation requires the use of a diagnostic scan tool. Refer to the appropriate Diagnostic & Testing article.

NOTE: **The wiper and washer switches are integral to the multifunction switch in the Steering Column Control Module (SCCM). The multifunction switch communicates with the SCCM microcontroller, which is also integral to the SCCM. The SCCM microcontroller communicates with the Body Control Module (BCM) (also known as the Common Body Controller/CBC) over the Controller Area Network (CAN) data bus. The BCM controls wiper motor operation through the wiper on-off and wiper high-low relays within the front Power Distribution Center (PDC).**

Before performing any of the following tests, determine whether the other functions of the multifunction switch are operational. If other multifunction switch functions are ineffective, diagnose and repair that problem before attempting to repair the Wiper and Washer System.

WIPER AND WASHER SYSTEM DIAGNOSIS		
CONDITION	**POSSIBLE CAUSES**	**CORRECTION**
WIPER MOTOR DOES NOT OPERATE IN ANY SWITCH POSITION	1. Ineffective motor ground circuit.	1. Test and repair open wiper motor ground circuit if required.
	2. Ineffective motor feed circuits.	2. Test and repair low speed and high speed feed circuits between front PDC and wiper motor if required.
	3. Ineffective SCCM inputs or outputs.	3. Use a diagnostic scan tool and the appropriate diagnostic information for further SCCM diagnosis.
	4. Ineffective BCM inputs or outputs.	4. Use a diagnostic scan tool and the appropriate diagnostic information for further BCM diagnosis.
	5. Ineffective wiper motor.	5. Test and replace open or shorted wiper motor if required.
WIPERS DO NOT PARK CORRECTLY	1. Ineffective wiper motor park switch input circuit.	1. Test and repair wiper park switch input circuit between BCM and wiper motor if required.
	2. Ineffective BCM inputs or outputs.	2. Use a diagnostic scan tool and the appropriate diagnostic information for further BCM diagnosis.
	3. Ineffective wiper motor park switch.	3. Test and replace wiper motor if required.
WIPER MOTOR OPERATES SLOWLY IN ALL SWITCH POSITIONS	1. Ineffective wiper motor.	1. Check amperage draw with linkage disconnected from wiper motor output shaft. Correct draw should be about 6 amperes. If incorrect, refer to the appropriate Possible Cause that follows.
	2. Amperage draw too low.	2. Test and repair shorted low and high speed feed circuits if required.
	3. Amperage draw too high.	3. With linkage disconnected from wiper motor output shaft, check linkage and pivots

WIPER AND WASHER SYSTEM DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
		for binding. If binding is detected, repair or replace wiper linkage module if required. If no linkage binding detected, replace the wiper motor if required.
WIPERS RUN AT HIGH SPEED WITH SWITCH LOW SPEED SELECTED OR AT LOW SPEED WITH SWITCH HIGH SPEED SELECTED	1. Ineffective motor feed circuit wiring.	1. Test and repair low speed and high speed feed circuits between front PDC and wiper motor if required.
AUTOMATIC WIPERS ONLY ARE INOPERATIVE	1. Automatic wipers (Rain Sensing) feature has been disabled.	1. Be certain that the automatic wipers (Rain Sensing) feature is enabled in the Customer Programmable Features Settings menu.
WASHER PUMP DOES NOT OPERATE	1. Ineffective washer pump ground circuit.	1. Test and repair open washer pump ground circuit if required.
	2. Ineffective washer pump feed circuits.	2. Test and repair washer pump feed circuit between BCM and washer pump if required.
	3. Ineffective SCCM inputs or outputs.	3. Use a diagnostic scan tool and the appropriate diagnostic information for further SCCM diagnosis.
	4. Ineffective BCM inputs or outputs.	4. Use a diagnostic scan tool and the appropriate diagnostic information for further BCM diagnosis.
	5. Ineffective washer pump.	5. Test and replace open or shorted washer pump if required.

DIAGNOSING FALSE WIPES (AUTOMATIC WIPER ONLY)

False wipes are unnecessary wipes that occur when the control knob of the multifunction switch is in one of the four automatic wiper sensitivity positions and no rain or moisture is apparent within the wipe pattern on the windshield glass. Because this system is designed to operate whenever it detects moisture, if the switch is in one of the automatic wiper sensitivity positions any road spray, bug splatters or mist from passing cars or trucks may occasionally cause the wipers to cycle. These are normal characteristics of this system and are not false wipes.

False wipes generally are the result of foreign material or flaws that interfere with the system optics. The optics for this system allow the Light Rain Sensor Module (LRSM) (also known as the Rain Light Sensor Module/RLSM, the Light Sensor Module/LSM or the Rain Sensor Module/RSM) to precisely transmit several InfraRed (IR) light beams and monitor the intensity of these beams reflected from the outer surface of the windshield glass to determine the presence of moisture. The sensitivity of this system is such that anything that distorts the focus or intensity of the IR light beams or impacts the ability of the photo diodes within the LRSM to see and accurately measure these light beams can result in the LRSM logic misinterpreting the resulting input data as moisture on the windshield. The optics for this system include the lenses of the LRSM, the adhesive silicone gelatin (SilGel) layer that bonds the LRSM to the inside of the windshield and the windshield glass.

The following procedure should only be used if false wipe occurrences are frequent and persistent. Perform

diagnosis of the wiper system, the multifunction switch and microcontroller of the Steering Column Control Module (SCCM) and the LRSM using a diagnostic scan tool and the appropriate diagnostic procedures before performing the following:

NOTE: **The Light Rain Sensor Module (LRSM) mounting bracket is serviced as a unit with the windshield glass. If either the bracket or the glass is ineffective or damaged, the entire LRSM bracket and windshield glass unit must be replaced. Also, if the LRSM is removed from the mounting bracket for any reason, the integrity of the adhesive silicone gelatin (SilGel) layer of the LRSM will be compromised and the silicone gelatin pad must be replaced with a new unit.**

1. Carefully inspect the outer surface of the windshield glass for physical damage, including scratches, cracks or chips in the vicinity of the LRSM mounting bracket. **Scratches, cracks or chips in the windshield glass outside the area of the LRSM mounting bracket lenses will not cause false wipes.** If OK, go to Step 2. If not OK, replace the damaged windshield.
2. From the outside of the windshield glass, carefully inspect the adhesive layer between the windshield glass and the LRSM bracket for any large voids (air pockets). If an adhesive void greater than about 1 millimeter (0.04 inch) is observed, replace the flawed silicone gelatin pad. If OK, go to Step 3.
3. Lightly pull the LRSM away from the windshield bracket to confirm that both sides of the spring steel LRSM mounting band are fully engaged with the mounting bracket on the inside of the windshield glass. If OK, go to Step 4. If not OK, install the LRSM mounting band onto the bracket as required.
4. Remove the LRSM from the mounting bracket. Carefully inspect the LRSM mounting bracket for any physical damage and inspect the windshield glass area within the LRSM mounting bracket for contamination. If OK, go to Step 5. If contaminated, clean any foreign material from the windshield glass using rubbing alcohol and a lint-free cloth. If damaged, replace the damaged LRSM bracket and windshield as a unit.
5. Carefully replace the LRSM with a new unit. Refer to **MODULE, LIGHT RAIN SENSOR, INSTALLATION**.

CLEANING

WASHER SYSTEM

CAUTION: Never introduce petroleum-based cleaners, solvents, or contaminants into the washer system. These products can rapidly deteriorate the rubber seals and hoses of the washer system, as well as the rubber squeegees of the wiper blades.

CAUTION: Never use compressed air to flush the washer system plumbing. Compressed air pressures are too great for the washer system plumbing components and will result in further system damage. Never use sharp instruments to clear a plugged washer nozzle or damage to the nozzle orifice and improper nozzle spray patterns will result.

If the washer system is contaminated with foreign material, drain the washer reservoir by removing the washer pump/motor unit from the reservoir. Clean foreign material from the inside of the washer pump inlet filter screen and the washer reservoir using clean washer fluid, a mild detergent or a non-abrasive cleaner. Flush foreign material from the washer system plumbing by first disconnecting the washer hoses from the washer nozzles, then running the washer pump/motor to run clean washer fluid or water through the system. Plugged or restricted washer nozzles cannot be back-flushed due to the integral check valve mechanism. If the washer nozzle obstruction cannot be cleared, replace the washer nozzle.

WIPER SYSTEM

CAUTION: Protect the rubber squeegees of the wiper blades from any petroleum-based cleaners, solvents, or contaminants. These products can rapidly deteriorate the rubber squeegees.

The squeegees of wiper blades exposed to the elements for a long time tend to lose their wiping effectiveness. Periodic cleaning of the squeegees and the windshield glass is suggested to remove any deposits of salt, wax or road film. The wiper blades, arms and windshield glass should only be cleaned using a sponge or soft cloth and windshield washer fluid, a mild detergent or a non-abrasive cleaner. If the wiper blades continue to leave streaks, smears, hazing or beading on the glass after cleaning of the squeegees and the glass, clean them again. Wiper blade assembly replacement will NOT resolve hazing or beading.

INSPECTION

WASHER SYSTEM

The washer system components should be inspected periodically, not just when washer performance problems are experienced. This inspection should include the following points:

1. Check for ice or other foreign material in the washer reservoir. If contaminated, clean and flush the washer system. Refer to **CLEANING**.
2. Inspect the washer plumbing for pinched, leaking, deteriorated or incorrectly routed hoses and damaged or disconnected hose fittings. Replace damaged or deteriorated hoses and hose fittings. Leaking washer hoses can sometimes be repaired by cutting the hose at the leak and splicing it back together using an in-line connector fitting. Similarly, sections of deteriorated hose can be cut out and replaced by splicing in new sections of hose using in-line connector fittings. Whenever routing a washer hose or a wire harness containing a washer hose, it must be routed away from hot, sharp, or moving parts. Also, sharp bends that might pinch the washer hose must be avoided. Leaking hard plastic tubing lines MUST be replaced with a

new unit.

WIPER SYSTEM

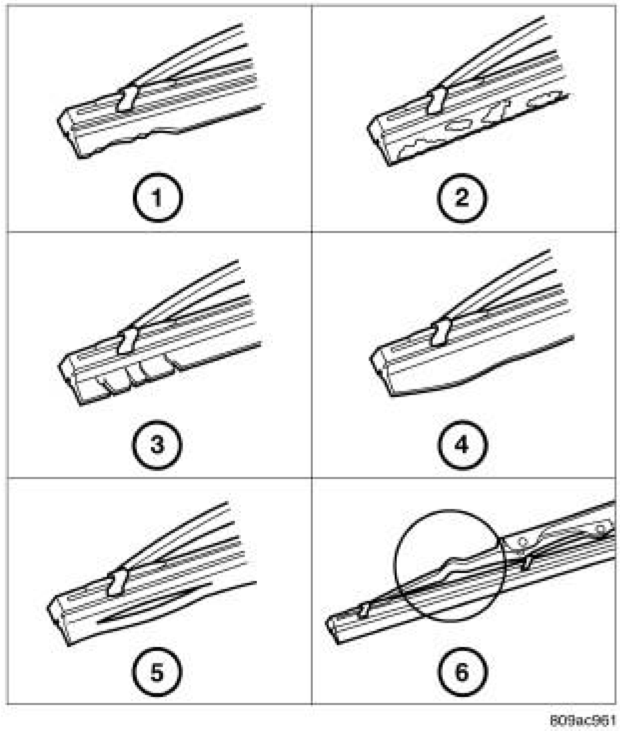

Fig. 2: Wiper Blades And Wiper Arms
Courtesy of CHRYSLER GROUP, LLC

The wiper blades and wiper arms should be inspected periodically, not just when wiper performance problems are experienced. This inspection should include the following points:

1. Carefully inspect the wiper blades for any indications of worn or uneven edges (1), foreign material deposits (2), hardening or cracking (3), deformation or fatigue (4) or splitting (5). Inspect the wiper blade support components and the wiper arms for damage (6) or severe corrosion. If the wiper arms and blades are contaminated with any foreign material, clean them and the glass as required. Refer to **CLEANING**. If a wiper blade or arm is damaged, or if severe corrosion is evident, replace the affected wiper arm or blade with a new unit. Do not attempt to repair a wiper arm or blade that is damaged or severely corroded.
2. Carefully lift the wiper blade off of the glass. Note the action of the wiper arm hinge. The wiper arm should pivot freely at the hinge, but with no lateral looseness evident. If there is any binding evident in the wiper arm hinge, or if there is evident lateral play in the wiper arm hinge, replace the wiper arm.

CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.

3. Once proper hinge action of the wiper arm is confirmed, check the hinge for proper spring tension. The spring tension of the wiper arm should be sufficient to cause the rubber squeegee to conform to the curvature of the glass. Replace a wiper arm if it has insufficient spring tension to maintain contact between the squeegee and the glass.

4. After cleaning and inspecting the wiper components and the glass, if the wiper blade still fails to clear the glass without smearing, streaking or chattering, replace the wiper blade.

ARM, WIPER

DESCRIPTION

DESCRIPTION

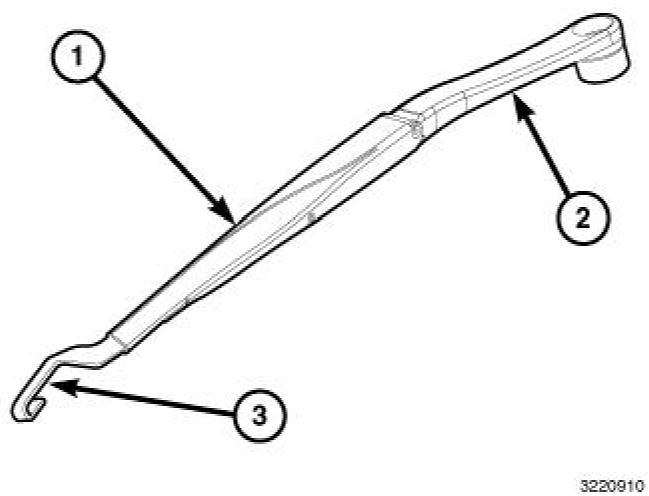

Fig. 3: Stamped Steel Channel, Aluminum Pivot End & Stamped Steel Strap
Courtesy of CHRYSLER GROUP, LLC

The wiper arms are the rigid members located between the wiper pivots that protrude from the cowl plenum cover/grille panel near the base of the windshield and the wiper blades on the windshield glass. These wiper arms include an over-center hinge design that allows easy access to the windshield glass for cleaning. The wiper arm has a die cast aluminum pivot end (2) with a large, internally tapered mounting boss at one end. A molded black plastic cap snaps over the pivot end to conceal the wiper arm retaining nut and the mounting hole following wiper arm installation.

The wide end of a tapered, stamped steel channel (1) hinges on and is secured with a hinge pin to the blade end of the wiper arm pivot end. One end of a stamped steel strap (3), is secured within the narrow end of the stamped steel channel. The tip of the wiper blade end of this strap is bent back under itself to form a small hook. The entire wiper arm has a satin black finish applied to all of its visible surfaces.

Concealed within the stamped steel channel is a long tension spring which is engaged with a formed wire link hooked over a metal dowel pin that passes through the underside of the pivot end. The opposite end of the spring is hooked over another metal dowel pin that passes through the underside of the steel channel.

The driver and passenger side wiper arms are not interchangeable. These arms have a letter **D** (Driver) or **P** (Passenger) cast into the surface of the pivot end to identify their proper locations. A wiper arm cannot be adjusted or repaired. If damaged or ineffective, the entire wiper arm unit must be replaced.

OPERATION

OPERATION

The wiper arms are designed to mechanically transmit the motion from the wiper pivots to the wiper blades. The wiper arm must be properly indexed to the wiper pivot in order to maintain the proper wiper blade travel on the glass. The tapered mounting hole in the wiper arm pivot end interlocks with the serrations on the tapered outer circumference of the wiper pivot shaft, allowing positive engagement and finite adjustment of this connection.

The mounting nuts lock the wiper arms to the threaded studs of the wiper pivot shafts. The spring-loaded wiper arm hinge controls the down-force applied through the tip of the wiper arm to the wiper blade on the glass. The hook formation on the tip of the wiper arm provides a cradle for securing and latching the wiper blade pivot block to the wiper arm.

REMOVAL

REMOVAL

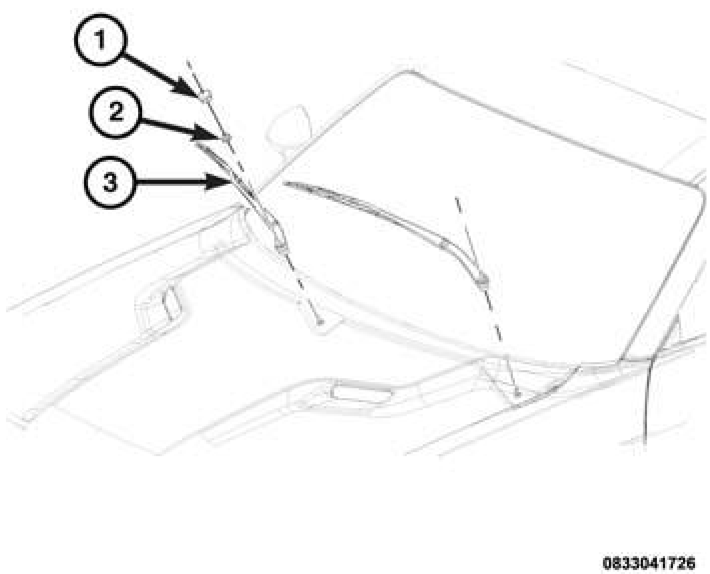

Fig. 4: Wiper Arm / Blade, Plastic Nut Cap & Nut
Courtesy of CHRYSLER GROUP, LLC

1. Lift the wiper arm and blade (3) to its over-center position to hold the wiper blade off of the glass and relieve the spring tension on the wiper arm to pivot shaft connection.
2. Carefully pry the plastic nut cap (1) off of the nut (2) on the pivot end of the wiper arm.
3. Remove the nut that secures the wiper arm to the wiper pivot shaft.

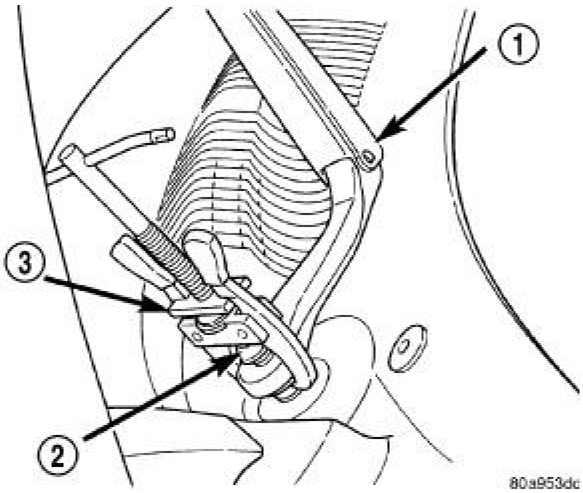

Fig. 5: Disengaging Wiper Arm From Pivot Shaft
Courtesy of CHRYSLER GROUP, LLC

4. If necessary, use a suitable battery terminal puller (3) to disengage the wiper arm (1) from the wiper pivot shaft (2).
5. Remove the wiper arm pivot end from the wiper pivot shaft.

INSTALLATION

INSTALLATION

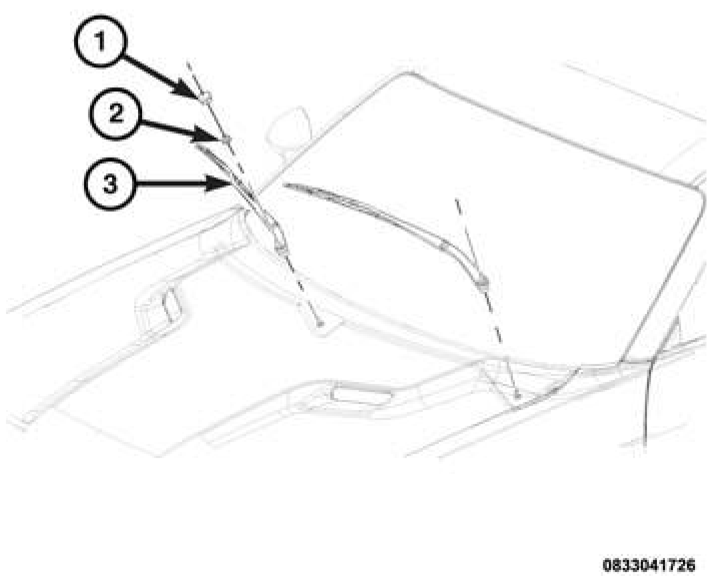

Fig. 6: Wiper Arm / Blade, Plastic Nut Cap & Nut
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Be certain that the wiper motor is in the park position before attempting to install the wiper arms. Transition the ignition switch to the On status and move the multifunction switch control knob to turn the wiper motor On, then turn it back to the Off position. Wait until the wiper pivot shafts stop moving, then transition the ignition switch back to the Off status. The wiper motor is now in the park position.**

NOTE: **The right and left wiper arms are not interchangeable. The right wiper arm pivot end is identified with a letter P (Passenger) and the left is identified with a letter D (Driver). Be certain that each wiper arm is installed on the proper wiper pivot.**

1. The wiper arm and blade (3) must be indexed to the pivot shaft with the wiper motor in the park position to be properly installed. Loosely position the wiper arm pivot end onto the wiper pivot shaft so that the wiper blade is aligned with the appropriate wiper alignment line, which is a mark located just below the upper margin of the lower windshield blackout area.
2. Once the wiper blade is aligned, push the pivot end of the arm down firmly and evenly over the pivot shaft until it is fully engaged.
3. Install and tighten the nut (2) that secures the wiper arm to the pivot shaft. Tighten the nut to **SPECIFICATIONS**.
4. Wet the windshield glass, then operate the wipers. Turn the wiper switch to the Off position, then check for correct wiper blade alignment and readjust as required.
5. Reinstall the plastic nut cap (1) onto the wiper arm mounting nut.

BLADE, WIPER

DESCRIPTION

DESCRIPTION

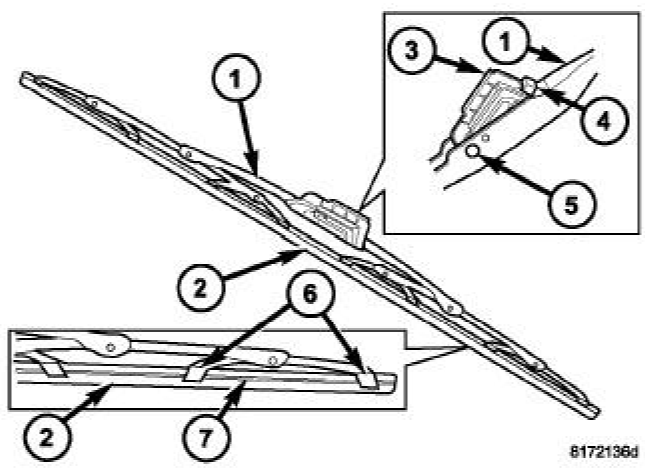

Fig. 7: Identifying Wiper Blade Components
Courtesy of CHRYSLER GROUP, LLC

Each wiper blade is secured by an integral latching pivot block (3) to the hook formation on the tip of each wiper arm, and rests on the glass near the base of the windshield when the wipers are not in operation. The wiper blade consists of the following components:

- **Superstructure (1)** - The superstructure includes several stamped steel bridges and links with claw formations (6) that grip the wiper blade element. Also included in this unit is the latching, molded plastic pivot block that secures the superstructure to the wiper arm. All of the metal components of the wiper blade have a satin black finish applied.
- **Element (2)** - The wiper element or squeegee is the resilient rubber member of the wiper blade that

contacts the glass.

- **Flexor (7)** - The flexor is a rigid metal component running along the length of each side of the wiper element where it is gripped by the claws of the superstructure.

The wiper blades are non-interchangeable and have non-replaceable rubber elements (squeegees). The driver side blade is 60.00 centimeters (23.62 inches) long, while the passenger side blade is 52.50 centimeters (20.67 inches) long. The wiper blades cannot be adjusted or repaired and, if ineffective, worn or damaged the entire wiper blade unit must be replaced.

OPERATION

OPERATION

The wiper blades are moved back and forth across the glass by the wiper arms when the wipers are being operated. The wiper blade superstructure is the flexible frame that grips the wiper blade element and evenly distributes the force of the spring-loaded wiper arm along the length of the element. The combination of the wiper arm force and the flexibility of the superstructure makes the element conform to and maintain proper contact with the glass, even as the blade is moved over the varied curvature that may be encountered across the glass surface.

The wiper element flexor provides the claws of the blade superstructure with a rigid, yet flexible component on the element which can be gripped. The rubber element is designed to be stiff enough to maintain an even cleaning edge as it is drawn across the glass, yet be resilient enough to conform to the glass surface and flip from one cleaning edge to the other each time the wiper blade changes directions.

REMOVAL

REMOVAL

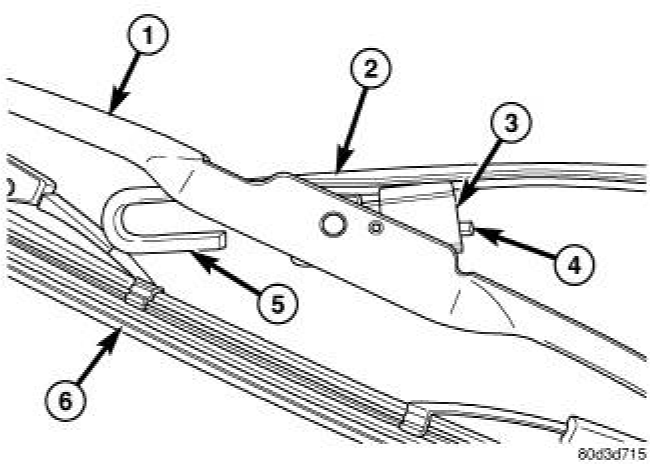

Fig. 8: Removing/Installing Wiper Blade
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.

1. Lift the wiper arm (2) to raise the wiper blade and element (6) off of the glass, until the wiper arm hinge

is in its over-center position.

2. To remove the blade from the arm, depress the latch release tab (4) on the pivot block (3) under the tip of the arm and slide the blade away from the tip towards the pivot end of the arm far enough to disengage the pivot block from the hook formation (5) on the end of the arm.
3. Extract the hook formation on the tip of the wiper arm through the opening in the wiper blade superstructure (1) just ahead of the pivot block.
4. Gently lower the tip of the wiper arm onto the glass.

INSTALLATION

INSTALLATION

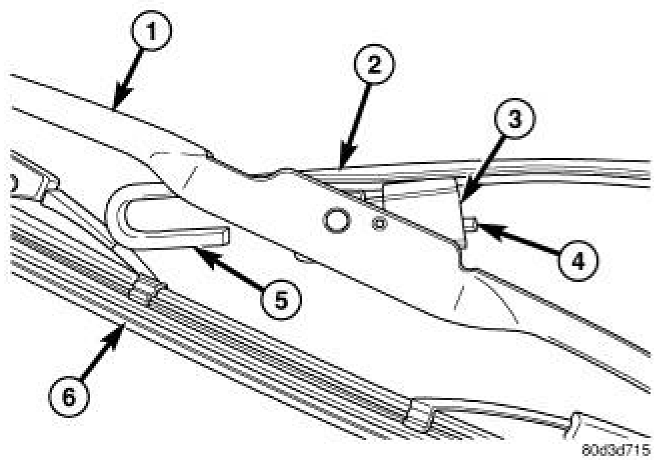

Fig. 9: Removing/Installing Wiper Blade
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.

1. Lift the wiper arm (2) off of the windshield glass, until the wiper arm hinge is in its over-center position.
2. Position the wiper blade near the hook formation (5) on the tip of the arm with the notched end of the wiper element flexor oriented towards the end of the wiper arm that is nearest to the wiper pivot.
3. Insert the hook formation on the tip of the arm through the opening in the blade superstructure (1) ahead of the pivot block (3) far enough to engage the pivot block into the hook.
4. Slide the pivot block up into the hook formation on the tip of the wiper arm until the latch release tab (4) snaps into its locked position. Latch engagement will be accompanied by an audible click.
5. Gently lower the wiper blade and element (6) onto the glass.

CHECK VALVE, WASHER

DESCRIPTION

DESCRIPTION

Diaphragm-type washer system check valves are standard equipment in this vehicle. The check valves for the

washer system are integral to their respective washer nozzles. Refer to **NOZZLE, WASHER, DESCRIPTION**.

OPERATION

OPERATION

HOSES AND TUBES, WASHER

DESCRIPTION

DESCRIPTION

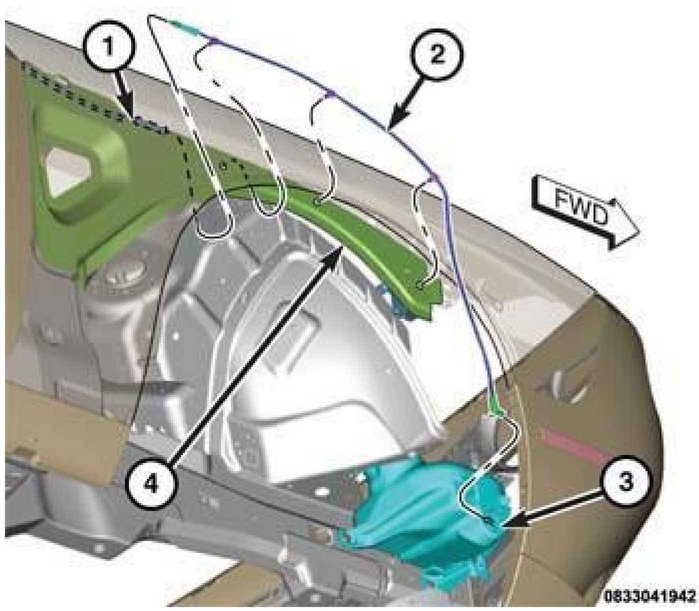

Fig. 10: Washer Reservoir, Right Load Beam & Front And Rear Hoses
Courtesy of CHRYSLER GROUP, LLC

The washer plumbing consists of small diameter rubber hose or hard plastic tubing that is routed from the washer reservoir (3) located on the outside of the right frame rail ahead of the right front wheel house near the right front corner of the engine compartment to the two washer nozzles mounted at the back of the inner hood panel reinforcement. The front hose (2) is attached to the outlet nipple of the washer pump/motor unit near the bottom of the reservoir.

The front hose is routed from the washer pump to the outboard side of the right load beam (4). The front and rear (1) hoses are connected by a molded plastic quick-connect fitting above the wheel house.

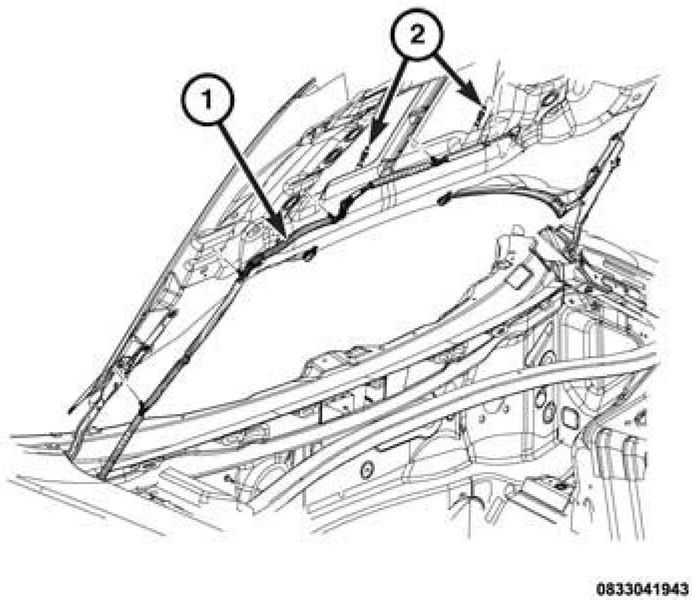

Fig. 11: Washer Nozzles & Rear Hose
Courtesy of CHRYSLER GROUP, LLC

The rear hose (1) is routed to the right side of the dash panel, then up to the right hood hinge. The rear washer hose is routed around the right hood hinge to the underside of the hood panel, then between the hood reinforcement and the hood silencer pad to the two washer nozzles (2). Molded rubber fittings provide the connections to the nipples of the washer nozzle tubes. Several plastic push-in type retainers secure the washer hose at regular intervals along its path from the washer pump to the washer nozzles.

Washer hose or tube is available for service only as roll stock, which must then be cut to length. The molded plastic and rubber washer hose fittings cannot be repaired. If these fittings are ineffective or damaged, they must be replaced.

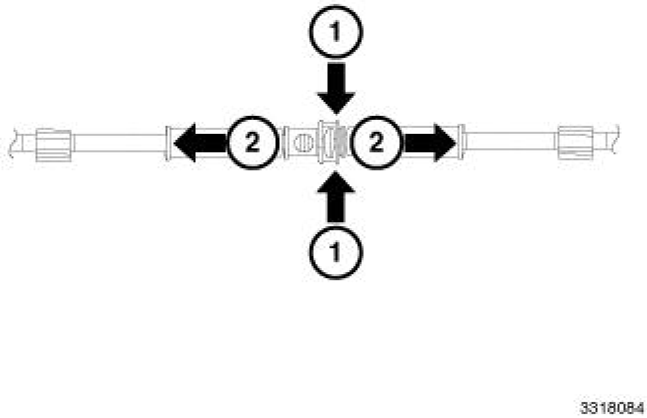
OPERATION

OPERATION

Washer fluid in the washer reservoir is pressurized and fed by the washer pump/motor unit through the washer system plumbing and fittings to the two washer nozzles. Whenever routing the washer plumbing or a wire harness containing washer plumbing, it must be routed away from hot, sharp, or moving parts; and, sharp bends that might pinch the plumbing must be avoided.

STANDARD PROCEDURE

STANDARD PROCEDURE - DISCONNECTING WASHER PLUMBING QUICK-CONNECT FITTING



[Fig. 12: Molded Plastic Quick-Connect & Washer Hose Tubes]
Courtesy of CHRYSLER GROUP, LLC

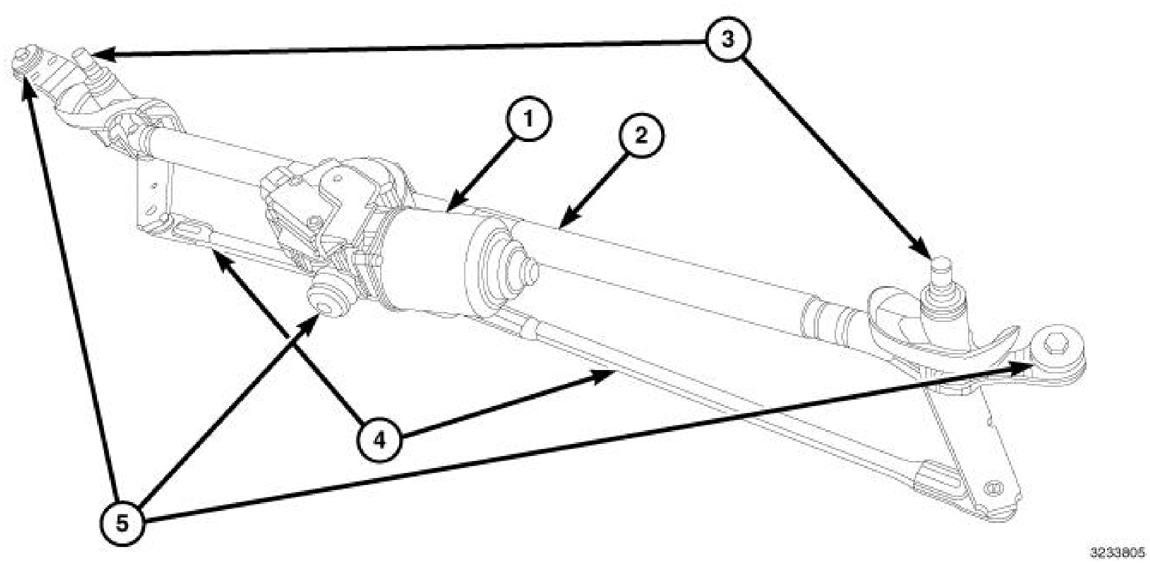
Molded plastic quick-connect fittings join sections of the washer plumbing. To disconnect this fitting:

1. Squeeze the two solid sides (not the open sides) of the female half of the quick-connect fitting at the outer edge.
2. While still squeezing the female half of the fitting, pull the two sections of the washer plumbing away from each other.

LINKAGE, WIPER ARM

DESCRIPTION

DESCRIPTION



[Fig. 13: Bracket, Insulators, Wiper Motor, Wiper Pivots & Steel Drive Links]
Courtesy of CHRYSLER GROUP, LLC

The wiper linkage module is secured within the cowl plenum panel beneath the cowl plenum cover/grille panel. The ends of the wiper pivot shafts protrude through dedicated openings in the cowl plenum cover/grille panel to drive the wiper arms and blades and are the only visible components of the wiper linkage module.

The wiper linkage module consists of the following major components:

- **Bracket** - The wiper linkage module bracket (2) consists of a long tubular steel main member that has a die cast pivot bracket formation near each end where the two wiper pivots are secured. The wiper linkage module bracket is secured within the cowl plenum by two screws through two rubber insulators (5).
- **Crank Arm** - The wiper motor crank arm is a stamped steel unit with a hole on the driven end that is secured to the wiper motor output shaft with a nut, and has a long double ball stud secured to the drive end.
- **Linkage** - Two stamped steel drive links (4) connect the wiper motor crank arm to the two wiper pivot lever arms. The passenger side link has a plastic socket-type bushing on each end, while the driver side link has a socket-type bushing on the pivot end and a sleeve-type bushing on the crank arm end. The bushing on the pivot end of each link is snap-fit over a ball stud on the pivot lever arm. The sleeve-type bushing on the driver side link is snap fit over the inner ball formation of a double ball stud on the crank arm, then the socket-type bushing of the passenger side drive link is snapped over the outer ball formation.
- **Motor** - The wiper motor (1) is secured by a bracket integral to the motor transmission housing with two screws and nuts near the center of the wiper linkage module bracket. A knob-like rubber insulator (5) on a stud integral to the motor transmission housing is engaged into a slot in a stamped metal bracket. The two-speed permanent magnet wiper motor features an integral transmission, an internal park switch, and an internal automatic resetting circuit breaker. An integral connector receptacle connects the motor to the vehicle electrical system.
- **Pivots** - The two front wiper pivots (3) are secured to the ends of the wiper module bracket. The lever arms that extend from the bottom of the pivot shafts each have ball studs that engage the bushings of the drive links. The upper end of each pivot shaft where the wiper arms will be fastened each is tapered and serrated with a threaded stud formation at the tip.

The wiper motor and crank arm unit is available for separate service replacement. Any other component of the wiper linkage module cannot be adjusted or repaired. If any component of the module other than the motor is ineffective or damaged, the entire wiper linkage module unit must be replaced.

OPERATION

OPERATION

The wiper linkage module operation is controlled by the battery current inputs received by the wiper motor through the wiper high-low and wiper on-off relays within the front Power Distribution Center (PDC). The Body Control Module (BCM) (also known as the Common Body Controller/CBC) controls both wiper relays. The wiper motor speed is controlled by current flow to either the low speed or the high speed set of brushes. An automatic resetting circuit breaker protects the motor from overloads.

The park switch is a single pole, single throw, momentary switch within the wiper motor that is mechanically actuated by the wiper motor transmission components. The park switch alternately closes the wiper park switch sense circuit to ground or to battery current, depending upon the position of the wipers on the glass. This feature allows the motor to complete its current wipe cycle after the wiper system has been turned Off, and to park the

wiper blades in the lowest portion of the wipe pattern.

The wiper motor crank arm, the two wiper linkage members and the two wiper pivots mechanically convert the rotary output of the wiper motor to the back and forth wiping motion of the wiper arms and blades on the glass.

The hard wired inputs and outputs of the wiper motor may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the wiper motor or the electronic controls and communication between other modules and devices that provide some features of the wiper and washer system. The most reliable, efficient and accurate means to diagnose the wiper motor or the electronic controls and communication related to wiper motor operation requires the use of a diagnostic scan tool. Refer to the appropriate Diagnostic & Testing article.

REMOVAL

REMOVAL

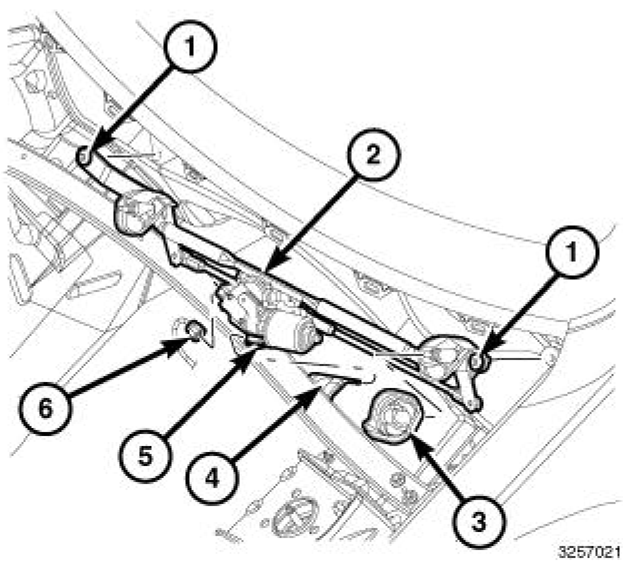


Fig. 14: Two Screws, Wiper Module, Foam Mucket, Rubber Isolator & Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The wiper motor can be removed from the wiper linkage module and is serviced independently from the remainder of the wiper linkage module for this vehicle. Refer to MOTOR, WIPER, REMOVAL.**

1. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery.
2. Remove both wiper arms from the wiper pivots. Refer to **ARM, WIPER, REMOVAL**.
3. Remove the cowl plenum cover/grille panel from over the wiper module (2). Refer to **COVER, COWL PANEL, REMOVAL** .
4. Remove the foam mucket (3) from the left wiper pivot cup.
5. Disconnect the wire harness connector (6) from the connector receptacle for the wiper motor.
6. Remove the two screws (1) that secure the module bracket to the cowl.
7. Pull the wiper linkage module toward the outboard side of the vehicle far enough to disengage the knob-

like rubber isolator (5) from the slotted bracket (4) on the front shock tower brace.

8. Remove the wiper linkage module from the cowl as a unit.

INSTALLATION

INSTALLATION

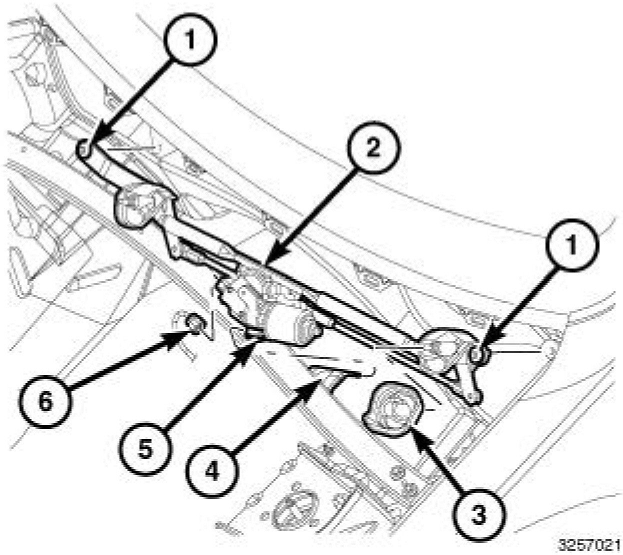

Fig. 15: Two Screws, Wiper Module, Foam Mucket, Rubber Isolator & Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE:	**The wiper motor can be removed from the wiper linkage module and is serviced independently from the remainder of the wiper linkage module for this vehicle. Refer to MOTOR, WIPER, REMOVAL.**

1. Position the wiper linkage module (2) to the cowl as a unit.
2. Position the knob-like rubber isolator (5) into the slotted bracket (4) on the front shock tower brace and push the module inboard far enough to seat the isolator in the bracket.
3. Starting on the outboard side, install and tighten the two screws (1) that secure the wiper linkage module to the cowl. Tighten the screws to **SPECIFICATIONS**.
4. Reconnect the wire harness connector (6) to the connector receptacle for the wiper motor. Be certain connector is fully engaged and locked.
5. Reinstall the foam mucket (3) onto the left wiper pivot cup.
6. Reinstall the cowl plenum cover/grille panel over the wiper linkage module. Refer to **COVER, COWL PANEL, INSTALLATION** .
7. Reinstall both wiper arms onto the wiper pivots. Refer to **ARM, WIPER, INSTALLATION**.
8. Reconnect the negative cable to the battery. If equipped with an Intelligent Battery Sensor (IBS), reconnect the IBS connector.

MODULE, LIGHT RAIN SENSOR

DESCRIPTION

DESCRIPTION

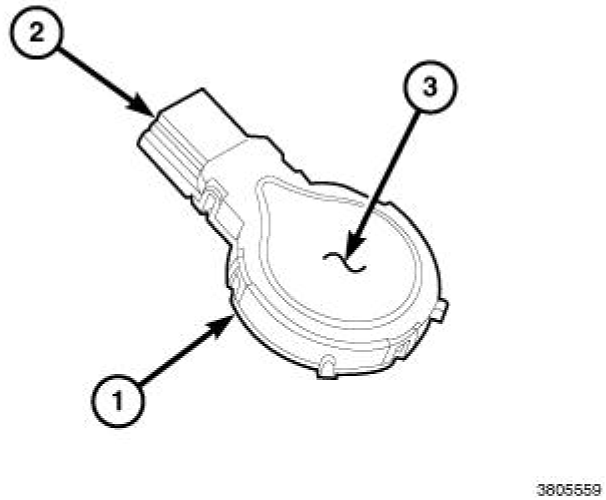

Fig. 16: Light Rain Sensor Module Components
Courtesy of CHRYSLER GROUP, LLC

The Light Rain Sensor Module (LRSM) (1) is the primary component of the automatic wiper system. The LRSM is also capable of performing an ambient light sensor function; therefore, it is alternately referred to as the Rain Light Sensor Module (RLSM), the Light Sensor Module (LSM), the Rain Light Sensor (RLS) or the Rain Sensor Module (RSM). The LRSM is located on the inside of the windshield glass just below and to the right of the inside rear view mirror mounting button. The LRSM is concealed from view within the vehicle interior by a molded plastic inside rear view mirror bracket trim cover that fits over the top of the LRSM housing and the LRSM mounting bracket, but the LRSM is visible through the windshield glass from the exterior of the vehicle.

The molded black plastic LRSM housing has an integral connector receptacle (2) with three terminal pins. These terminal pins connect the LRSM to the vehicle electrical system through a dedicated take out and connector of the overhead wire harness that extends from above the headliner. The windshield side of the housing is filled with a clear, silicone gelatin (also known as SilGel) adhesive membrane pad (3), which serves as an optical coupler between the sensor and the inside of the windshield glass. A spring steel retaining strap or clip extends forward on each side of the housing to latch the LRSM to a molded black plastic mounting bracket, which is permanently bonded to the inside of the windshield glass.

Concealed and protected within the LRSM housing is the electronic circuitry of the module, which includes an InfraRed (IR) diode and photocell based light and rain sensors, control electronics and Local Interface Network (LIN) data bus communication management hardware. The LRSM is a LIN slave node and communicates over a single LIN bus circuit with the Body Control Module (BCM) (also known as the Common Body Controller/CBC). The BCM is a LIN master node and a gateway to the Controller Area Network (CAN) data bus. The BCM controls the exchange of electronic messages back and forth between the LRSM and other electronic modules in the vehicle, as well as with a diagnostic scan tool connected to the Data Link Connector (DLC).

The LRSM cannot be adjusted or repaired. If ineffective or damaged, the entire module must be replaced. The silicone gelatin adhesive membrane pad is available for separate service replacement. The LRSM mounting bracket is serviced only as a unit with the windshield glass.

OPERATION

OPERATION

The Light Rain Sensor Module (LRSM) (also known as the Rain Light Sensor Module/RLSM, the Light Sensor Module/LSM, the Rain Light Sensor/RLS or the Rain Sensor Module/RSM) senses moisture and ambient light levels on the outside of the windshield glass and sends electronic messages to the Body Control Module (BCM) (also known as the Common Body Controller/CBC) over the Local Interface Network (LIN) data bus. The BCM relays messages back and forth between the LRSM and other electronic modules in the vehicle.

For the rain sensor function, InfraRed (IR) diodes within the LRSM generate infrared light beams that are aimed by the optics of the sensor through the windshield glass, while an IR photo diode monitors the infrared light reflected back from the windshield glass. When sufficient moisture accumulates within the wipe pattern on the windshield glass, less of the infrared light is reflected back and the sensor detects a change in the monitored infrared light intensity. For the light sensor function, an IR photo diode within the sensor monitors the intensity of the ambient infrared light received through the windshield glass and the sensor optics.

The internal programming of the LRSM sends the appropriate electronic **wipe command** messages to the BCM over the LIN data bus. The BCM then responds by activating or deactivating the wiper system. Similarly, the LRSM provides electronic **ambient light level** messages to the BCM, and the BCM relays these messages to other electronic modules in the vehicle.

The Steering Column Control Module (SCCM) microcontroller sends electronic **wiper switch status** and **automatic wipe sensitivity level** messages over the Controller Area Network (CAN) data bus to the BCM based upon the driver-selected settings of the control knob on the control stalk of the multifunction switch. The higher the selected wipe sensitivity setting the more sensitive the LRSM is to the accumulated moisture on the windshield glass, and the more frequently the LRSM will send **wipe commands** to the BCM to operate the wiper system. The BCM also monitors electronic **automatic display brightness level** messages based upon the driver-selected settings of the Electronic Vehicle Information Center (EVIC) as well as electronic messages from other electronic modules in the vehicle received over the CAN data bus, then relays the messages to the LRSM over the LIN bus.

The LRSM operates on battery current received through a fused ignition output (run) circuit. The LRSM has a path to ground at all times through a take out of the body wire harness with an eyelet terminal that is secured to the body sheet metal. Therefore, the LRSM is operational only when the ignition switch status is On.

If the BCM receives an electronic status message from the LRSM indicating a sensor failure condition, a **Rain Sensor Failure** message should be displayed by the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC). It is important to note that the default operation of the automatic wiper system is continuous wipe On, while the default operation for automatic lighting is On. Therefore, if no command message is received by the BCM from the LRSM for more than about five seconds when the Automatic wipe mode is selected, the wipers will default to Low Speed or High Speed continuous wipe operation. Likewise, if no command message is received by the BCM from the LRSM when the Automatic lighting mode is selected, the exterior lighting will default to On. The BCM must be properly configured for the automatic wipers and automatic lighting options in order for these systems to function.

The hard wired circuits of the LRSM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the LRSM or the electronic controls and communication between other modules and devices that provide some features of the automatic wiper and automatic lighting systems. The most reliable, efficient and accurate means to diagnose the LRSM or the electronic controls and

communication related to LRSM operation requires the use of a diagnostic scan tool. Refer to the appropriate Diagnostic & Testing article.

STANDARD PROCEDURE

PROTECTIVE CAP REMOVAL

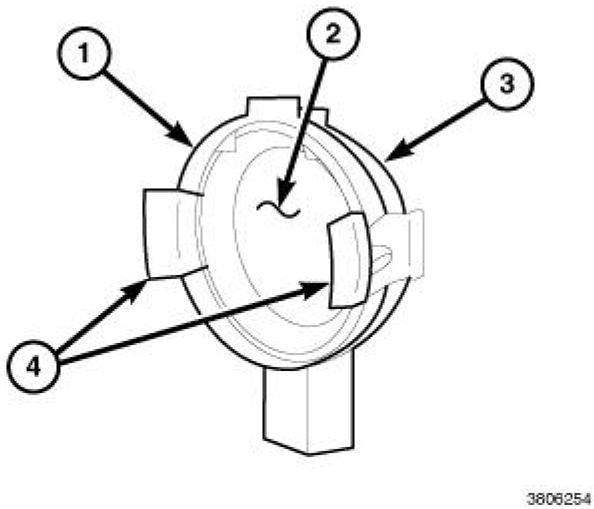

Fig. 17: Protective Cap, Adhesive Membrane, LRSM & Latches
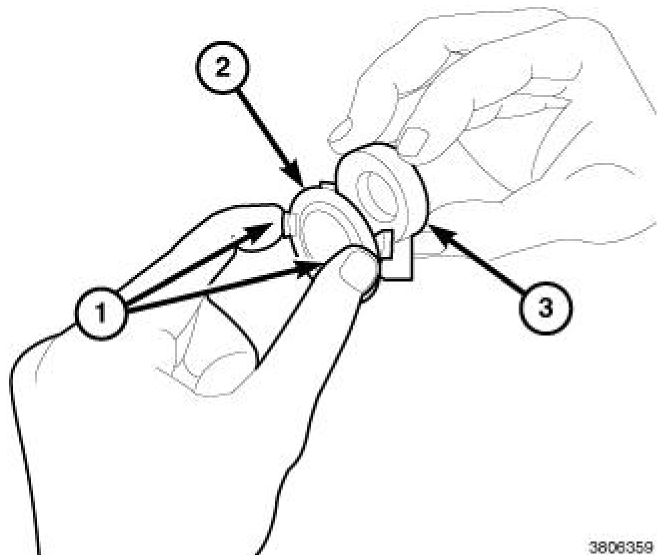
Courtesy of CHRYSLER GROUP, LLC

CAUTION: **The Light Rain Sensor Module (LRSM) (3) is equipped with a clear, silicone gelatin (SilGel) adhesive membrane (2) that serves as an optical coupler between the sensor and the windshield glass. Extreme care must be exercised to protect this membrane from contamination before it is installed in the vehicle. The LRSM should always be serviced only in a dust-free environment. Do not touch the membrane with your fingers or tools. The membrane should only come into contact with the clean and dry inside surface of the glass within the mounting bracket bonded to the windshield. The service replacement LRSM is shipped with a clear plastic protective cap (1) installed and secured to the outer circumference of the LRSM by two latch features (4). This protective cap should not be removed until immediately before the LRSM is to be installed using the following procedure.**



[**Fig. 18: Tabs, Protective Cap & LRSM**]
Courtesy of CHRYSLER GROUP, LLC

1. Firmly grasp the LRSM (3) by the outer circumference from the side opposite the SilGel membrane pad.
2. Firmly grasp the protective shipping cap (2) of the LRSM by the two latch release tabs (1) between your thumb and index finger from the SilGel membrane pad side of the module.
3. Firmly pinch the two latch release tabs together between your thumb and index finger far enough to release the two latch features of the protective cap from the outer circumference of the LRSM.
4. Pull the protective cap off of the LRSM.
5. Install the LRSM into the mounting bracket bonded onto the windshield as instructed in the Installation procedure. Refer to **MODULE, LIGHT RAIN SENSOR, INSTALLATION**.

SILICONE GELATIN PAD REPLACEMENT

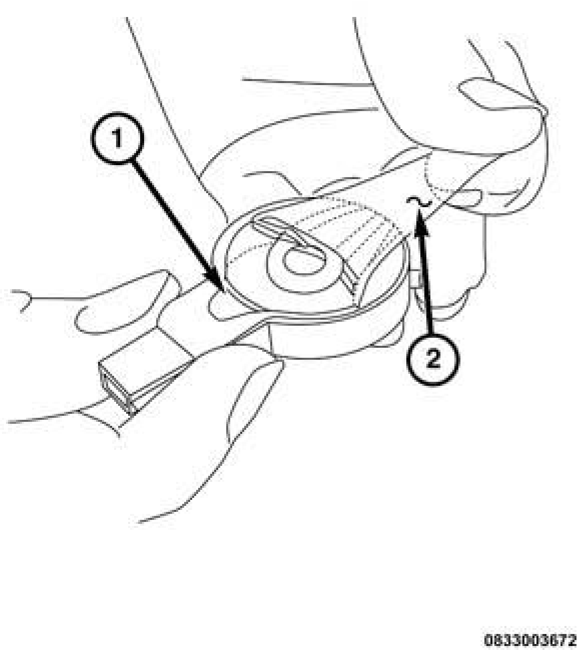


Fig. 19: LRSM & Adhesive Membrane
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The Light Rain Sensor Module (LRSM) is equipped with a clear, silicone gelatin (SilGel) adhesive membrane that serves as an optical coupler between the sensor and the windshield glass. Extreme care must be exercised to protect this membrane from contamination before it is installed in the vehicle. The LRSM should always be serviced only in a dust-free environment. Do not touch the membrane with your fingers or tools. The membrane should only come into contact with the clean and dry inside surface of the glass within the mounting bracket bonded to the windshield. If contaminated, clean any foreign material from the windshield glass using rubbing alcohol and a lint-free cloth. A contaminated SilGel membrane will negatively impact LRSM performance.

CAUTION: When installing the replacement silicone gelatin (SilGel) adhesive membrane pad onto the Light Rain Sensor Module (LRSM), it is necessary to minimize air pockets trapped between the SilGel membrane and the LRSM. Excessive air pockets will negatively impact LRSM performance. It is important to adhere to the procedure steps in a deliberate manner to achieve satisfactory results.

1. Carefully peel away the old silicone gelatin adhesive membrane pad (2) from the windshield (optics) side of the Light Rain Sensor Module (LRSM) (1).
2. Thoroughly clean the windshield (optics) side of the LRSM using isopropyl alcohol and a clean, lint-free cloth.
3. Using care not to contaminate, touch or damage the replacement pad, peel off the yellow protective foil.

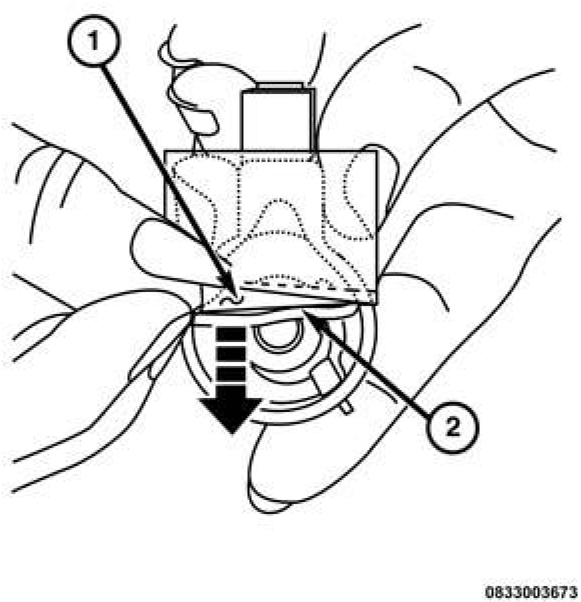

Fig. 20: Protective Film & Replacement Pad
Courtesy of CHRYSLER GROUP, LLC

4. Looking through the transparent protective film (1), align and center the replacement pad (2) over the

windshield (optics) side of the LRSM. Then use a slow, smooth and deliberate motion to roll the pad onto the windshield (optics) side of the LRSM.

5. With the transparent protective film still in place, use a thumb and a firm wiping motion to press the entire surface pad against the windshield (optics) side of the LRSM.
6. To avoid contamination or damage of the replacement pad, do not remove the transparent protective film until just before reinstalling the LRSM onto the windshield. Refer to **MODULE, LIGHT RAIN SENSOR, INSTALLATION**.

REMOVAL

REMOVAL

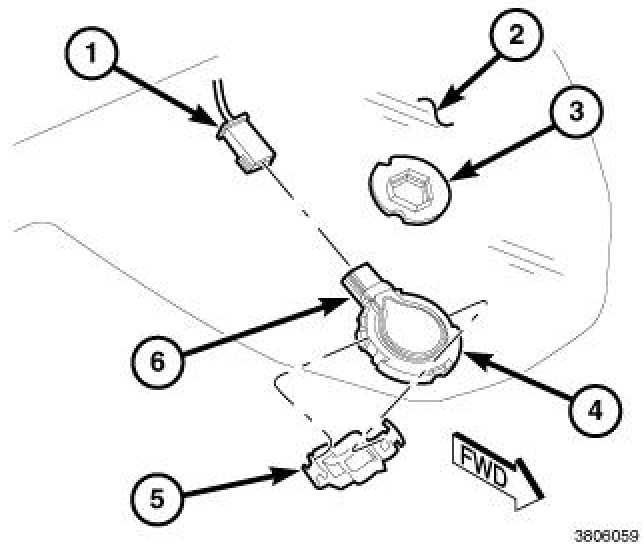

Fig. 21: LRSM, Harness Connector, Mount Bracket & Retaining Strap
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery.
2. Remove the inside rear view mirror from the mounting button (3) on the inside of the windshield glass (2). Refer to **MIRROR, REARVIEW, REMOVAL** .
3. Disconnect the wire harness connector (1) from the connector receptacle for the Light Rain Sensor Module (LRSM) (6).
4. Insert the tip of a small screwdriver into the rectangular cutout on one side of the spring steel retaining strap (5) on the LRSM and carefully pry the end of the strap closest to the glass away from the groove in the mounting bracket (4) on the windshield. Now rotate the loose side of the strap away from the glass far enough to disengage the other side of the strap from the mounting bracket groove.
5. Firmly grasp the connector receptacle of the LRSM to pull the module away from the windshield glass and the mounting bracket.
6. If the LRSM will be reinstalled, the silicone gelatin (also known as SilGel) adhesive membrane pad MUST be removed, discarded and replaced with a new unit as described in: **STANDARD PROCEDURE** - Silicone Gelatin Pad Replacement.

INSTALLATION

INSTALLATION

CAUTION: The Light Rain Sensor Module (LRSM) is equipped with a clear, silicone gelatin (SilGel) adhesive membrane that serves as an optical coupler between the sensor and the windshield glass. Extreme care must be exercised to protect this membrane from contamination before it is installed in the vehicle. The LRSM should always be serviced only in a dust-free environment. Do not touch the membrane with your fingers or tools. The membrane should only come into contact with the clean and dry inside surface of the glass within the mounting bracket bonded to the windshield. If contaminated, clean any foreign material from the windshield glass using rubbing alcohol and a lint-free cloth. A contaminated SilGel membrane will negatively impact LRSM performance.

CAUTION: When installing the Light Rain Sensor Module (LRSM) it is necessary to minimize air pockets trapped between the SilGel membrane and the windshield glass. Excessive air pockets will negatively impact LRSM performance. It is important to adhere to the procedure steps in a deliberate manner to achieve satisfactory results.

CAUTION: To avoid excessive air pockets, do not try to install the spring steel retaining strap until AFTER the Light Rain Sensor Module (LRSM) has been successfully positioned to the glass within the mounting bracket bonded to the windshield.

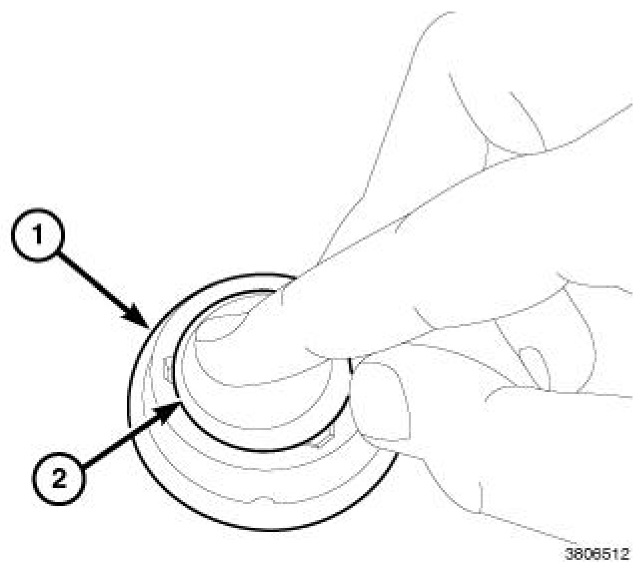

Fig. 22: LRSM & Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

1. If a new Light Rain Sensor Module (LRSM) is being installed, remove the protective shipping cap from the LRSM as described in: **STANDARD PROCEDURE** - Protective Cap Removal. If an existing LRSM is being reused, the silicone gelatin (also known as SilGel) adhesive membrane pad MUST be removed, discarded and replaced with a new unit as described in: **STANDARD PROCEDURE** - Silicone Gelatin Pad Replacement.
2. Grasp the LRSM (2) by the connector receptacle between your thumb and middle finger. Place your index finger on the back of the LRSM at the point opposite the connector receptacle.

3. Align the LRSM with the mounting bracket (1) bonded onto the inside of the windshield glass near the inside rear view mirror mounting button.
4. Slowly insert the LRSM into the mounting bracket at a slight angle so that the edge of the module nearest the tip of your index finger makes the initial contact with the windshield glass.
5. Using a slow, deliberate motion and light pressure, draw your index finger across the back of the LRSM toward the connector receptacle until the silicone gelatin adhesive membrane pad is in full contact with the windshield glass.

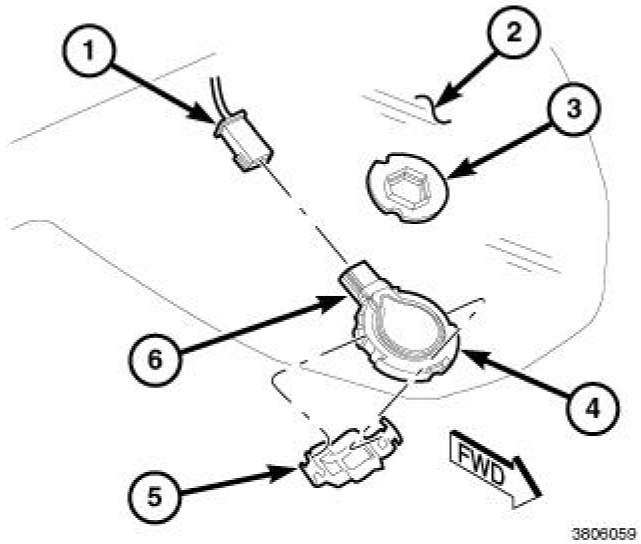

Fig. 23: LRSM, Harness Connector, Mount Bracket & Retaining Strap
Courtesy of CHRYSLER GROUP, LLC

6. Engage one side of the spring steel retaining strap (5) into the groove on one side of the LRSM mounting bracket (4) on the inside of the windshield glass (2).
7. Depress the opposite side of the retaining strap over the LRSM firmly and evenly until it fully engages the groove of the mounting bracket with an audible click.
8. Looking through the windshield from outside the vehicle, inspect the silicone gelatin adhesive membrane pad for air pockets. If air pockets are observed, let the vehicle stand for about four hours at room temperature to allow the air pockets to dissipate. If an adhesive void (air pocket) greater than about 1 millimeter (0.04 inch) is observed, replace the flawed silicone gelatin adhesive membrane pad with a new unit as described in: **STANDARD PROCEDURE** - Silicone Gelatin Pad Replacement.
9. Reconnect the wire harness connector (1) to the LRSM connector receptacle (6).
10. Reinstall the inside rear view mirror to the mounting button (3) on the inside of the windshield glass. Refer to **MIRROR, REARVIEW, INSTALLATION** .
11. Reconnect the negative cable to the battery. If equipped with an Intelligent Battery Sensor (IBS), reconnect the IBS connector.

MOTOR, WIPER

DESCRIPTION

DESCRIPTION

The wiper motor is packaged with the wiper linkage module in this vehicle. Refer to **LINKAGE, WIPER ARM, DESCRIPTION**.

OPERATION

OPERATION

The wiper motor is packaged with the wiper linkage module in this vehicle. Refer to **LINKAGE, WIPER ARM, OPERATION**.

REMOVAL

REMOVAL

CAUTION: Do not apply pressure to, or pry on the plastic drive link bushings. When removing a drive link from, or installing a drive link onto the ball stud on the wiper motor crank arm apply pressure to, or pry on only the metal portions of the drive link around the bushing. If the bushing is damaged, the entire wiper linkage module MUST be replaced.

CAUTION: Do not remove the crank arm nut from the wiper motor output shaft. The crank arm is indexed to the output shaft with the motor in the park position during the manufacturing process, but there are no provisions made for correctly indexing this connection in the field. If the crank arm to output shaft indexing is incorrect, the entire wiper motor and crank arm unit MUST be replaced.

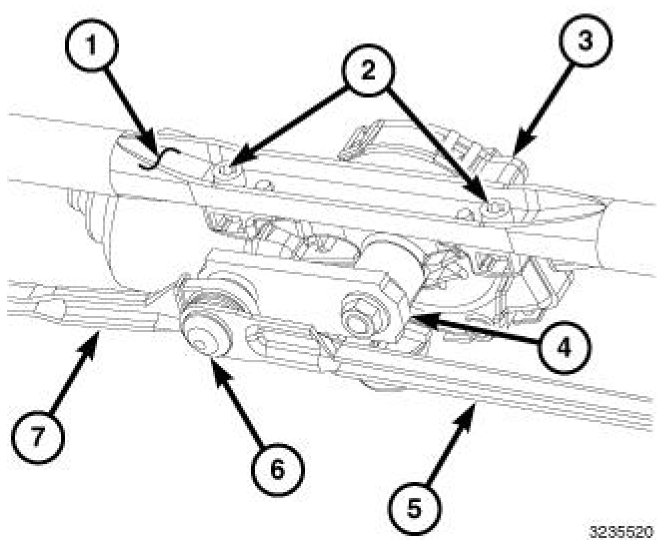

Fig. 24: Module Bracket, Two Screws, Motor, Crank Arm, Drive Link, Bushing & Wiper Drive Link
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery.
2. Remove the wiper linkage module from the vehicle and place it on a suitable work surface. Refer to **LINKAGE, WIPER ARM, REMOVAL**.
3. Disengage the socket bushing (6) of the right wiper drive link (5) from the double ball stud on the wiper motor crank arm (4) using two large screwdrivers, one on each side of the double ball stud. Pry firmly

and evenly between the crank arm and the metal portion of the drive link until the socket unsnaps from the ball.

4. Disengage the sleeve bushing of the left wiper drive link (7) from the double ball stud on the wiper motor crank arm.
5. Remove the two screws (2) that secure the motor (3) bracket to the module bracket (1).
6. Remove the wiper motor and crank arm as a unit from the underside of the module bracket.

INSTALLATION

INSTALLATION

CAUTION: Do not apply pressure to, or pry on the plastic drive link bushings. When removing a drive link from, or installing a drive link onto the ball stud on the wiper motor crank arm apply pressure to, or pry on only the metal portions of the drive link around the bushing. If the bushing is damaged, the entire wiper linkage module MUST be replaced.

CAUTION: Do not remove the crank arm nut from the wiper motor output shaft. The crank arm is indexed to the output shaft with the motor in the park position during the manufacturing process, but there are no provisions made for correctly indexing this connection in the field. If the crank arm to output shaft indexing is incorrect, the entire wiper motor and crank arm unit MUST be replaced.

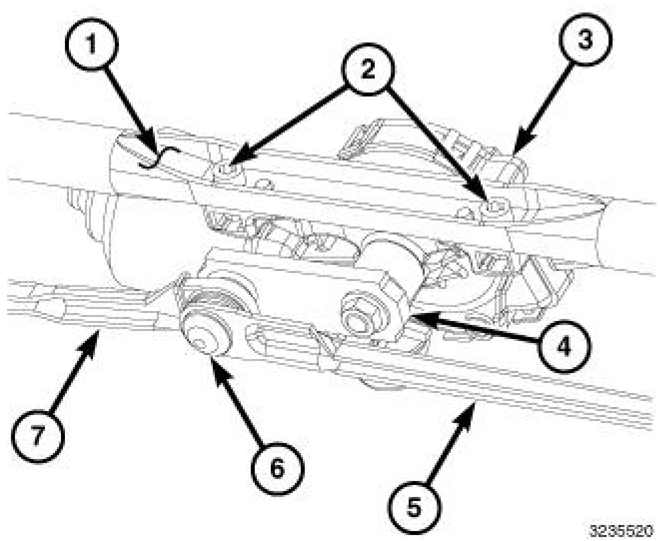

Fig. 25: Module Bracket, Two Screws, Motor, Crank Arm, Drive Link, Bushing & Wiper Drive Link
Courtesy of CHRYSLER GROUP, LLC

1. Be certain that the two nuts are positioned properly within the pockets of the wiper motor (3) bracket.
2. Position the wiper motor and crank arm as a unit to the underside of the wiper module bracket (1).
3. Install and tighten the two screws (2) into the two nuts that secure the motor bracket to the module bracket. Tighten the screws to SPECIFICATIONS.
4. Position the sleeve bushing of the left wiper drive link (7) onto the double ball stud on the end of the motor crank arm (4).

5. Position the socket bushing (6) of the right wiper drive link (5) over the double ball stud on the crank arm.
6. Place a short 19 millimeter or 3/4 inch socket over the domed cap side of the socket bushing as an installation tool. Use large channel-lock pliers to firmly and evenly apply enough pressure between the back of the crank arm and the top of the socket installation tool to snap the bushing onto the ball stud. **Do not apply pressure directly to the plastic bushings.**

NOTE: **Be certain to transition the ignition switch to the On status, then turn the wiper switch On and Off again to cycle the wiper motor and linkage to their natural park position before reinstalling the wiper arms onto the wiper pivots.**

7. Reinstall the wiper linkage module into the vehicle. Refer to **LINKAGE, WIPER ARM, INSTALLATION**.
8. Reconnect the negative cable to the battery. If equipped with an Intelligent Battery Sensor (IBS), reconnect the IBS connector.

NOZZLE, WASHER

DESCRIPTION

DESCRIPTION

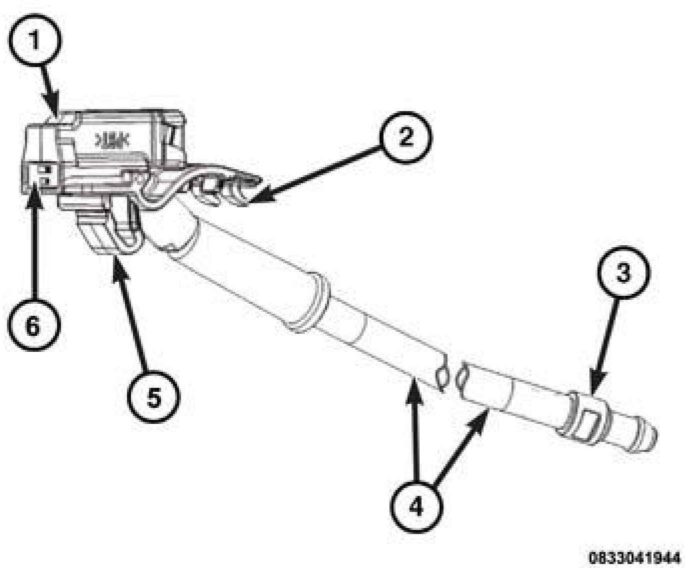

Fig. 26: Washer Nozzle, Tabs, Integral Latch, Orifices, Tubing & Fitting
Courtesy of CHRYSLER GROUP, LLC

The fluidic washer nozzles (1) are constructed of molded plastic and include an integral check valve. Each nozzle has integral locating tabs (2) and an integral latch (5) that secures it in a dedicated mounting hole in the rearward surface of the hood inner reinforcement panel near the base of the windshield. The washer nozzle is concealed below the rear edge of the outer hood panel, but the nozzle orifices (6) are oriented towards the windshield glass.

An integral diaphragm type check valve is contained within the body of each nozzle. A short length of nylon

reinforced tubing (4) extends the washer plumbing fitting (3) for the washer nozzle through the inner hood panel reinforcement below the hood panel where it is accessible from the engine compartment.

The washer nozzles cannot be adjusted or repaired and, if ineffective or damaged, they must be replaced.

OPERATION

OPERATION

The two washer nozzles are designed to dispense washer fluid into the wiper pattern area on the outside of the windshield glass. Pressurized washer fluid is fed to each nozzle from the washer reservoir by the washer pump/motor unit through a single hose, which is attached to a barbed nipple on each washer nozzle below the hood panel. A fluidic matrix within the washer nozzle causes the pressurized washer fluid to be emitted from the nozzle orifice as an oscillating stream to more effectively cover a larger area of the glass to be cleaned.

The integral check valve in each nozzle prevents washer fluid from draining out of the washer supply hoses back to the washer reservoir. This drain-back would result in a lengthy delay after the washer switch is actuated until washer fluid was dispensed through the nozzles, because the washer pump would have to refill the washer plumbing from the reservoir to the nozzles. Such a drain-back condition could also result in water, dirt, or other outside contaminants being siphoned into the washer system through the washer nozzle orifice. This water could subsequently freeze and plug the nozzle, while other contaminants could interfere with proper nozzle operation and cause improper nozzle spray patterns. In addition, the check valve prevents washer fluid from siphoning through the washer nozzles after the washer system is turned Off.

When the washer pump pressurizes and pumps washer fluid from the reservoir through the washer plumbing, the fluid pressure unseats a diaphragm from over a sump well within the nozzle by overriding the spring pressure applied to it by a piston. With the diaphragm unseated, washer fluid is allowed to flow toward the nozzle orifice. When the washer pump stops operating, the spring pressure on the piston seats the diaphragm over the sump well in the nozzle and fluid flow in either direction within the washer plumbing is prevented.

REMOVAL

REMOVAL

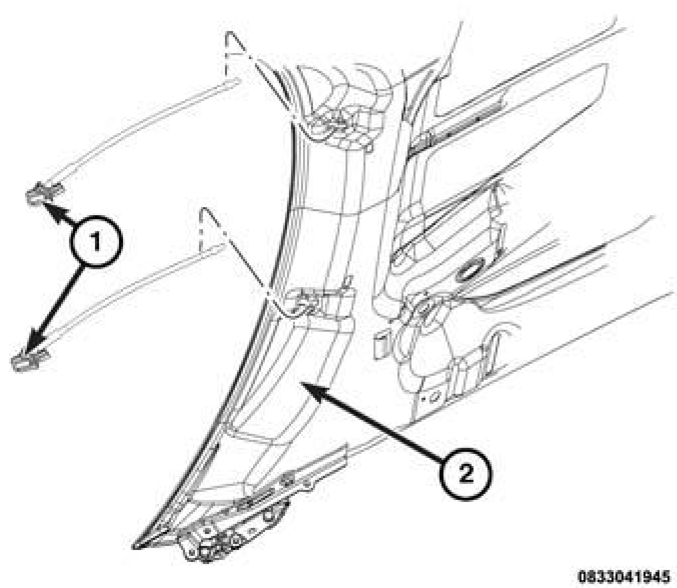

Fig. 27: Washer Nozzle & Inner Hood Reinforcement
Courtesy of CHRYSLER GROUP, LLC

1. From the underside of the hood, remove the push-in retainers that secure the rear edge of the hood silencer pad to the inner hood reinforcement (2) as necessary to access the washer nozzle (1) hose connections.
2. From the underside of the hood, disconnect the washer nozzle hose fitting from the barbed nipple of the washer nozzle.

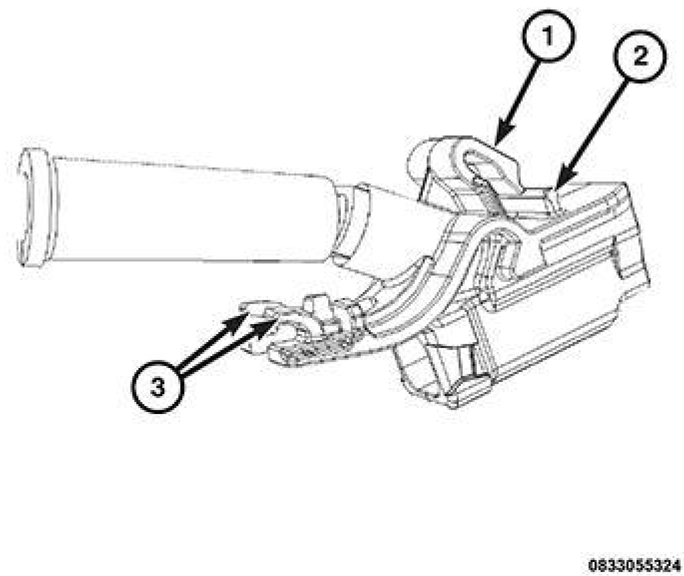

Fig. 28: Latch Feature, Ridge & Tabs
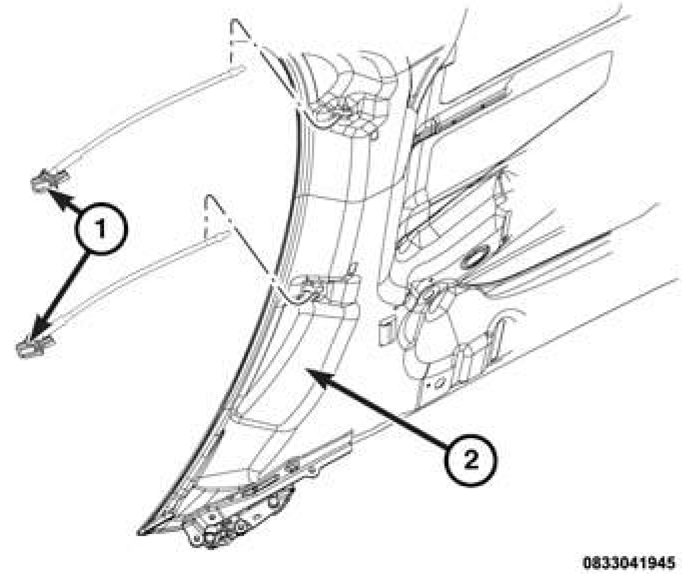
Courtesy of CHRYSLER GROUP, LLC

3. From the rear edge of the hood, insert a small flat-bladed screw driver between the hood inner reinforcement and the body of the washer nozzle body far enough to compress the latch feature (1) far enough to lower the nozzle from the upper edge of the mounting hole.
4. Pull the washer nozzle rearward to disengage the locating tab features (3) of the nozzle from the lower edge of the mounting hole and remove the nozzle from the inner hood reinforcement.

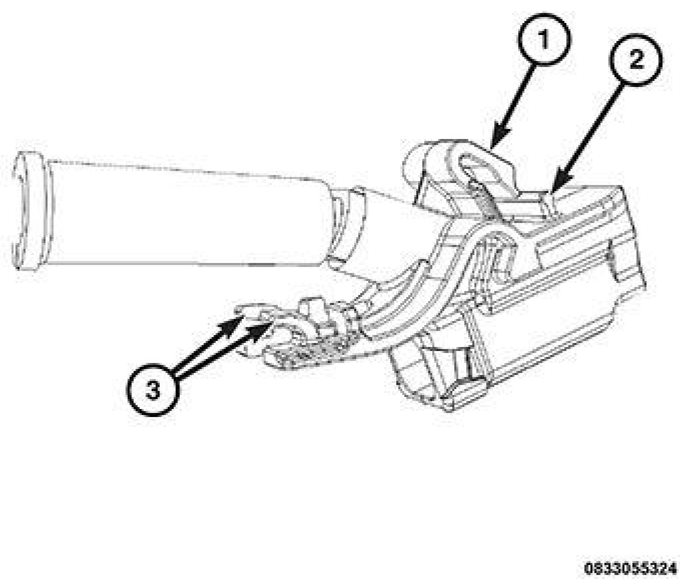
INSTALLATION

INSTALLATION



[Fig. 29: Washer Nozzle & Inner Hood Reinforcement]
Courtesy of CHRYSLER GROUP, LLC

1. Position the washer nozzle (1) to the mounting hole on the rear surface of the inner hood reinforcement (2).



[Fig. 30: Latch Feature, Ridge & Tabs]
Courtesy of CHRYSLER GROUP, LLC

2. Insert the washer nozzle nipple and extension tube through the mounting hole far enough to engage the integral locating tabs (3) of the nozzle with the lower edge of the mounting hole.
3. Index the locating ridge (2) on the nozzle body to the upper edge of the mounting hole.
4. Using hand pressure, push firmly and evenly on the washer nozzle body until the integral latch feature (1) snaps into place within the mounting hole.
5. From the underside of the hood, reconnect the washer hose fitting to the barbed nipple of the nozzle.
6. Reinstall the push-in retainers that secure the rear edge of the hood silencer pad to the inner hood

reinforcement.

PUMP, WINDSHIELD WASHER

DESCRIPTION

DESCRIPTION

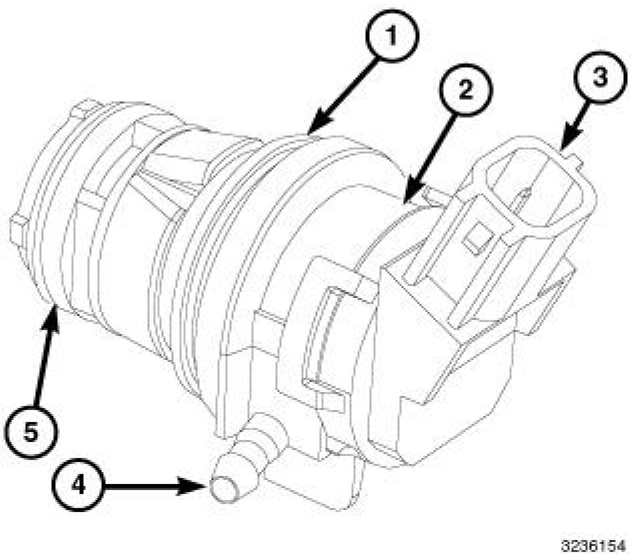


Fig. 31: Washer Pump/Motor Unit, Inlet Nipple, Grommet Seal, Barbed Outlet Nipple & Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

The washer pump/motor unit (2) is located in a sump area on the outboard facing side of the washer reservoir on the right frame rail, ahead of the right front wheel house. A small permanently lubricated and sealed electric motor is coupled to the rotor-type washer pump.

An inlet nipple (5) on the end of the pump housing passes through a rubber grommet seal (1) installed in a dedicated mounting hole in the sump area at the base of the washer reservoir. When the pump is installed in the reservoir, a barbed outlet nipple (4) on the pump housing connects the unit to the front washer plumbing.

The washer pump/motor unit is retained on the reservoir by the interference fit between the pump inlet nipple and the grommet seal, which is a light press fit. An integral connector receptacle (3) on the top of the motor housing connects the unit to the vehicle electrical system through a dedicated take out and connector of the headlamp and dash wire harness.

The washer pump/motor unit cannot be repaired. If ineffective or damaged, the entire washer pump/motor unit must be replaced.

OPERATION

OPERATION

The washer pump/motor unit features a small Direct Current (DC) electric motor. The motor is connected to the vehicle electrical system through a single take out and two-cavity connector of the headlamp and dash wire harness. The motor is grounded at all times through another take out of the headlamp and dash wire harness

with a single eyelet terminal connector that is secured by a screw to the body sheet metal in the engine compartment.

The Body Control Module (BCM) (also known as the Common Body Controller/CBC) controls the washer pump/motor control circuit through a high side driver based upon electronic **washer request** messages received over the Controller Area Network (CAN) data bus from the Steering Column Control Module (SCCM) microcontroller. The SCCM microcontroller monitors hard wired analog and digital inputs from the washer switch circuitry contained within the multifunction switch to determine the proper electronic messages to send.

Washer fluid is drawn through the pump inlet nipple from the washer reservoir to the inlet port of the washer pump housing. A filter screen integral to the pump inlet port prevents most debris from entering the pump housing. When the pump motor is energized, the motor spins the rotor within the washer pump. The spinning pump rotor pressurizes the washer fluid and forces it through the pump outlet nipple, the washer plumbing, and the washer nozzles onto the windshield glass.

The washer pump/motor unit and the hard wired circuits connected to the unit may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication between other modules and devices that provide many features of the wiper and washer system. The most reliable, efficient and accurate means to diagnose the washer pump/motor unit or the electronic controls and communication related to washer pump/motor unit operation requires the use of a diagnostic scan tool. Refer to the appropriate Diagnostic & Testing article.

REMOVAL

REMOVAL

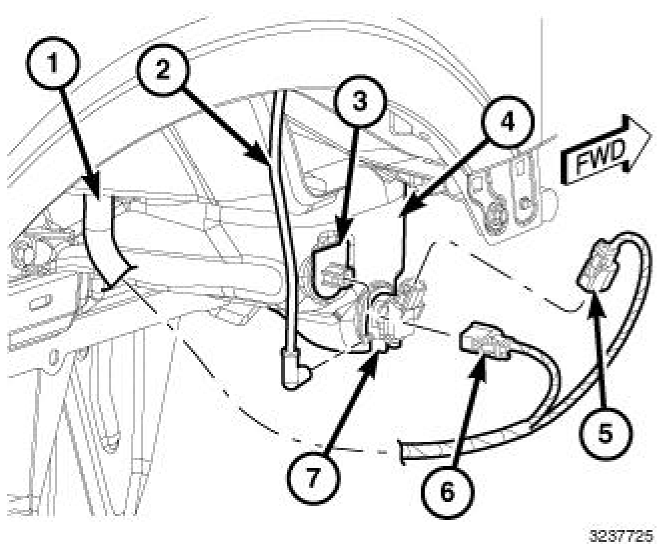

Fig. 32: Washer Pump/Motor Unit, Washer Reservoir, Dash Wire Harness, Pump Motor & Washer Hose
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The washer pump/motor unit may be removed from the washer reservoir without removing the reservoir from the vehicle.**

1. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery.

2. Turn the steering wheel to move the front wheels to the full right turn position.
3. Raise and support the vehicle.
4. Remove the fasteners that secure the forward end of the right front wheel house splash shield to the inner fender panel and the front fascia. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** .
5. Pull the forward end of the splash shield away from the inner fender panel and front fascia far enough to access the washer pump/motor unit (7) on the washer reservoir (4) on the outboard side of the right frame rail.
6. Disconnect the headlamp and dash wire harness (1) connector for the washer pump motor (5) from the motor connector receptacle.
7. Disconnect the washer hose (2) from the barbed outlet nipple of the washer pump and allow the washer fluid to drain into a clean container for reuse.
8. Using hand pressure, firmly grasp and pull the washer pump outward far enough to disengage the pump inlet nipple from the rubber grommet seal in the reservoir. Care must be taken not to damage the reservoir.
9. Remove the washer pump/motor unit from the washer reservoir.
10. Remove the rubber grommet seal from the washer pump mounting hole in the reservoir and discard.

INSTALLATION

INSTALLATION

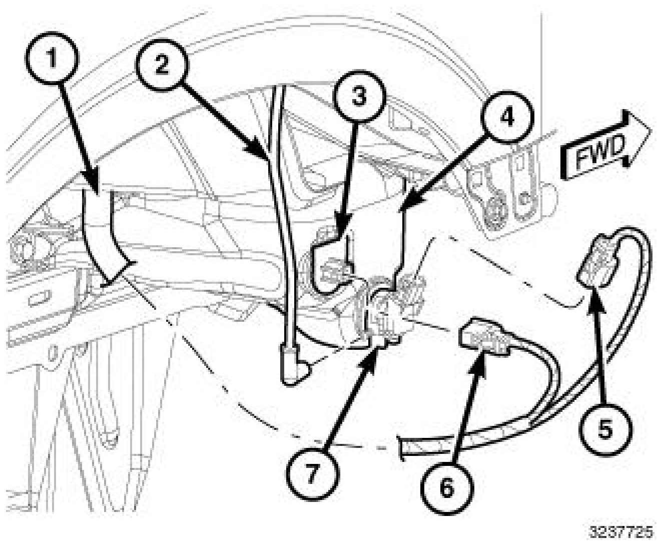

Fig. 33: Washer Pump/Motor Unit, Washer Reservoir, Dash Wire Harness, Pump Motor & Washer Hose
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The washer pump/motor unit may be removed from the washer reservoir without removing the reservoir from the vehicle.**

1. Lubricate a new rubber grommet seal with clean washer fluid and install it into the washer pump mounting hole in the washer reservoir (4). Always use a new rubber grommet seal on the reservoir.
2. Position the inlet nipple at the base of the pump housing of the washer pump/motor unit (7) to the rubber grommet seal in the reservoir.

3. Using hand pressure, press firmly and evenly on the washer pump/motor unit until the inlet nipple is fully seated in the rubber grommet seal in the pump mounting hole of the reservoir.
4. Reconnect the washer hose (2) to the barbed outlet nipple of the washer pump.
5. Reconnect the headlamp and dash wire harness (1) connector for the washer pump/motor unit (5) to the connector receptacle on the top of the pump motor.
6. Reinstall the fasteners that secure the right front wheel house splash shield to the inner fender panel and the front fascia. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION** .
7. Lower the vehicle.
8. Reconnect the negative cable to the battery. If equipped with an Intelligent Battery Sensor (IBS), reconnect the IBS connector.
9. Refill the washer reservoir with the washer fluid drained from the reservoir during the removal procedure.

RELAY, WIPER, HIGH AND LOW

DESCRIPTION

DESCRIPTION

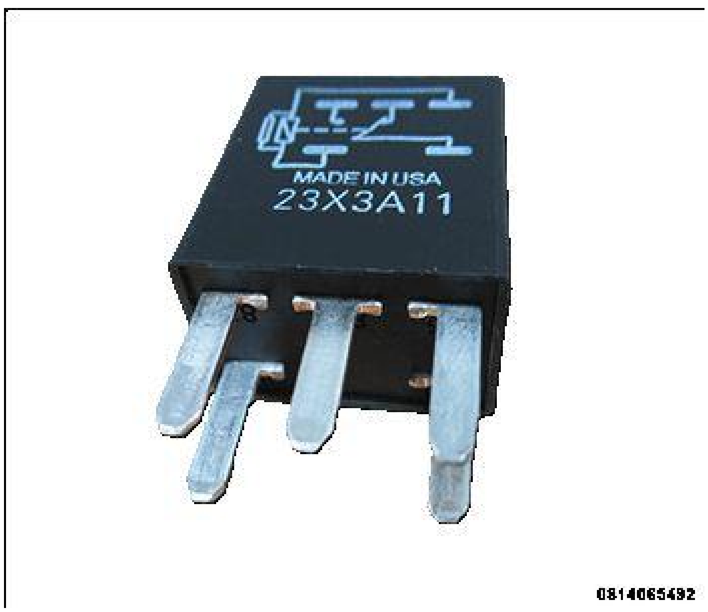

Fig. 34: Wiper On And Off Relay
Courtesy of CHRYSLER GROUP, LLC

The wiper high and low relay is a conventional International Standards Organization (ISO) micro relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns and terminal functions. This relay is contained within a small, rectangular, molded plastic housing and is connected to all of the required inputs and outputs through five integral male terminals that extend from the relay base plate.

Internally, the wiper high and low relay is a electromechanical device that consists of an electromagnetic coil, a resistor and a pair of normally open electrical contacts. One of the two electrical contacts is fixed, while the other contact is movable. The movable relay contact is held away from the fixed contact by spring pressure. The wiper high and low relay for this vehicle is installed in a cavity within the front Power Distribution Center

(PDC), which is located on the top of the right front wheel house ahead of the strut tower within the engine compartment. Refer to the layout label on the underside of the PDC cover for specific relay cavity assignment information.

The wiper high and low relay cannot be repaired or adjusted and, if ineffective or damaged, the relay unit must be replaced.

OPERATION

OPERATION

The wiper high and low relay within the front Power Distribution Center (PDC) switches the output of the wiper On and Off relay between the high speed and low speed feed circuits of the wiper motor. The Body Control Module (BCM) (also known as the Common Body Controller/CBC) controls the electromagnetic coil of the relay using a High Side Driver (HSD). When the electromagnetic relay coil is energized, it draws and holds the normally open movable contact of the relay against the fixed relay contact. When the BCM de-energizes the electromagnetic relay coil, spring pressure returns the movable contact to the normally open position.

The open relay contacts direct the output of the wiper on and off relay to the low speed feed circuit of the wiper motor. The closed relay contacts direct the output of the wiper on and off relay to the high speed feed circuit of the wiper motor. The resistor within the relay is connected in parallel with the electromagnetic coil, and helps to dissipate voltage spikes that are produced when the coil is de-energized.

The hard wired inputs and outputs of the wiper high and low relay within the front PDC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the BCM or the electronic controls and communication between modules and other devices that provide some features of the BCM-controlled wiper high and low relay. The most reliable, efficient and accurate means to diagnose the BCM or the electronic controls and communication related to BCM-controlled wiper high and low relay operation requires the use of a diagnostic scan tool. Refer to the appropriate Diagnostic & Testing article.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - WIPER HIGH AND LOW RELAY

The hard wired inputs and outputs of the wiper high and low relay within the front Power Distribution Center (PDC) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the Body Control Module (BCM) (also known as the Common Body Controller/CBC) or the electronic controls and communication between modules and other devices that provide some features of the BCM-controlled wiper high and low relay. The most reliable, efficient and accurate means to diagnose the BCM or the electronic controls and communication related to BCM-controlled wiper high and low relay operation requires the use of a diagnostic scan tool. REMOVAL

REMOVAL

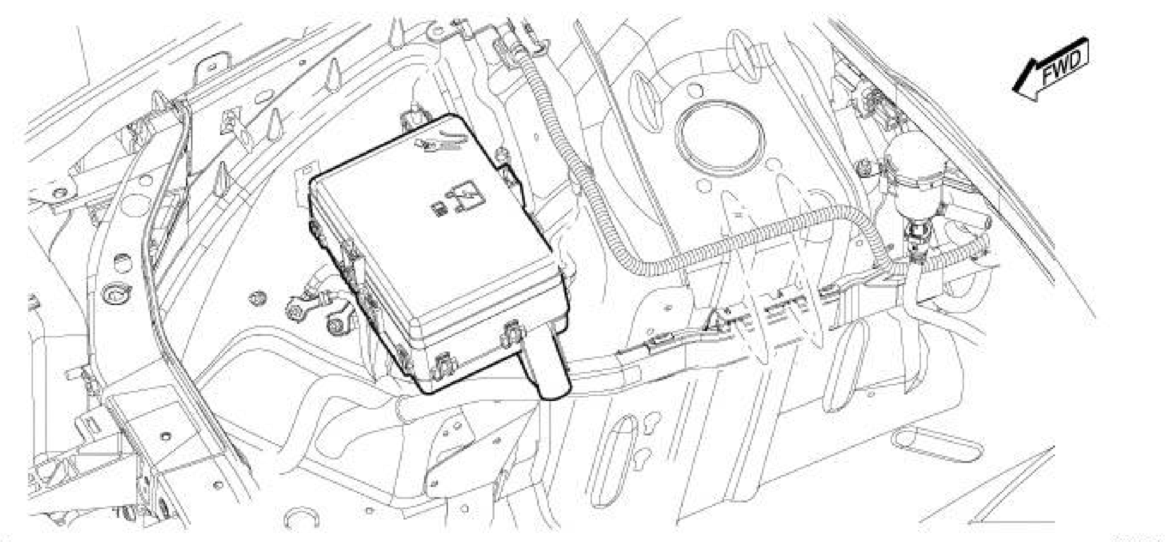
[Fig. 35: Identifying Front PDC]()
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery.
2. Remove the cover from the front Power Distribution Center (PDC) located ahead of the right strut tower on the right front wheel house splash shield in the engine compartment.
3. Refer to the fuse and relay layout map on the underside of the PDC cover for wiper high and low relay identification and cavity location.
4. Remove the wiper high and low relay by grasping it firmly and pulling it straight out from the cavity within the front PDC.

INSTALLATION

INSTALLATION



[Fig. 36: Identifying Front PDC]()
Courtesy of CHRYSLER GROUP, LLC

1. Refer to the fuse and relay layout map on the underside of the front Power Distribution Center (PDC) cover for the proper wiper high and low relay identification and cavity location.
2. Position the wiper high and low relay in the proper cavity within the front PDC.
3. Align the relay terminals with the terminal cavities in the PDC.
4. Push firmly and evenly on the top of the relay until the terminals are fully seated in the terminal cavities in the PDC.
5. Reinstall the cover onto the front PDC.
6. Reconnect the negative cable to the battery. If equipped with an Intelligent Battery Sensor (IBS), reconnect the IBS connector.

RELAY, WIPER, ON AND OFF

DESCRIPTION

DESCRIPTION

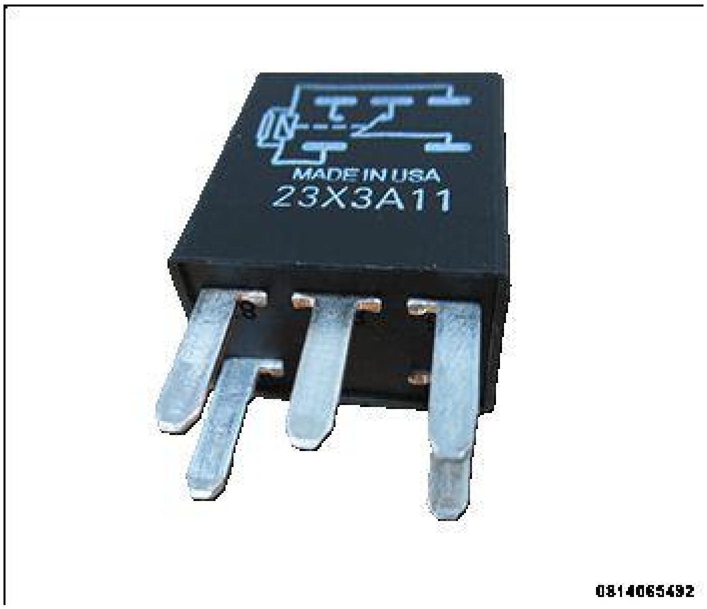


Fig. 37: Wiper On And Off Relay
Courtesy of CHRYSLER GROUP, LLC

The wiper On and Off relay is a conventional International Standards Organization (ISO) micro relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions. This relay is contained within a small, rectangular, molded plastic housing and is connected to all of the required inputs and outputs through five integral male terminals that extend from the relay base plate.

Internally, the wiper On and Off relay is a electromechanical device that consists of an electromagnetic coil, a resistor and a pair of normally open electrical contacts. One of the two electrical contacts is fixed, while the other contact is movable. The movable relay contact is held away from the fixed contact by spring pressure. The wiper On and Off relay for this vehicle is installed in a cavity within the front Power Distribution Center (PDC), which is located on the top of the right front wheel house ahead of the strut tower within the engine compartment. Refer to the layout label on the underside of the PDC cover for specific relay cavity assignment information.

The wiper On and Off relay cannot be repaired or adjusted and, if ineffective or damaged, the relay unit must be replaced.

OPERATION

OPERATION

The wiper On and Off relay within the front Power Distribution Center (PDC) switches the input to the wiper high and low relay from a fused B (+) circuit. The Body Control Module (BCM) (also known as the Common Body Controller/CBC) controls the electromagnetic coil of the relay using a High Side Driver (HSD). When the electromagnetic relay coil is energized, it draws and holds the normally open movable contact of the relay against the fixed relay contact. When the BCM de-energizes the electromagnetic relay coil, spring pressure returns the movable contact to the normally open position.

The closed relay contacts direct fused battery current from the front PDC to the wiper high and low relay. The resistor within the relay is connected in parallel with the electromagnetic coil, and helps to dissipate voltage spikes that are produced when the coil is de-energized.

The hard wired inputs and outputs of the wiper On and Off relay within the front PDC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the BCM or the electronic controls and communication between modules and other devices that provide some features of the BCM-controlled wiper On and Off relay. The most reliable, efficient and accurate means to diagnose the BCM or the electronic controls and communication related to BCM-controlled wiper On and Off relay operation requires the use of a diagnostic scan tool. Refer to the appropriate Diagnostic & Testing article.

5. Reinstall the cover onto the front PDC.
6. Reconnect the negative cable to the battery. If equipped with an Intelligent Battery Sensor (IBS), reconnect the IBS connector.

RESERVOIR, WINDSHIELD WASHER

DESCRIPTION

DESCRIPTION

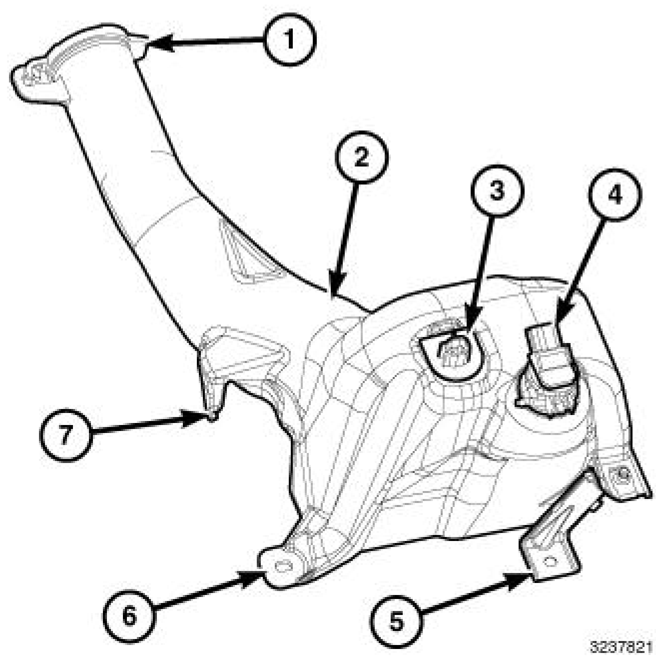

Fig. 40: Fluid Reservoir, Filler Neck And Cap Unit, Washer Pump/Motor Unit, Switch, Locating Post, Mounting Tab & Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

The molded plastic washer fluid reservoir (2) is mounted on the outboard side of the right frame rail, ahead the right front wheel, where it is concealed by the right front wheel house splash shield. The only visible component of the washer reservoir is the filler neck and cap unit (1), which extends upward into the engine compartment just forward of the right strut tower. A bright yellow plastic filler cap with a rubber seal and an International Control and Display Symbol icon for **Windshield Washer** and the text **Washer Fluid Only** molded into it snaps over the open end of the filler neck. The cap hinges on and is secured to a molded-in hook formation on the rear of the reservoir filler neck.

There are separate, dedicated holes on the outboard side of the reservoir provided for the washer pump/motor unit (4) and the washer fluid level switch (3). The rear inboard side of the washer reservoir has an integral

locating post (7) and an integral mounting tab (6), while the front outboard corner has a mounting tab that includes a stamped steel mounting bracket (5). The rear mounting tab and front mounting bracket are secured to the frame rail by screws. The right front fender wheel house splash shield must be removed to access the washer reservoir for service.

The washer reservoir cannot be repaired and, if ineffective or damaged, it must be replaced. The washer reservoir, rubber grommet seals for the washer pump/motor unit and the washer fluid level switch as well as the filler cap are each available for individual service replacement.

OPERATION

OPERATION

The washer fluid reservoir provides a secure, on-vehicle storage location for a large reserve of washer fluid for operation of the washer system. The washer reservoir filler neck provides a clearly marked and readily accessible point from which to add washer fluid to the reservoir.

The washer pump/motor unit is located in a sump area near the bottom on the outboard side of the reservoir to be certain that washer fluid will be available to the pump as the fluid level in the reservoir becomes depleted. The washer pump/motor unit is mounted in the lowest position in the sump. The washer fluid level switch is mounted just above the sump area of the reservoir so that there will be adequate warning to the vehicle operator that the washer fluid level is low, before the washer system will no longer operate.

REMOVAL

REMOVAL

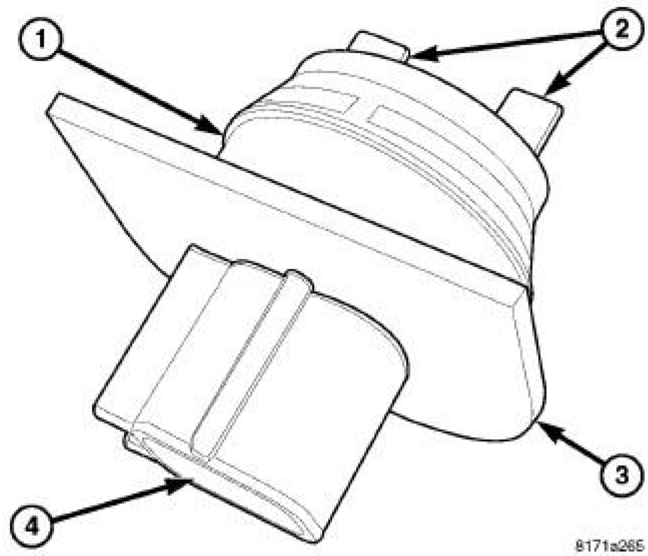
3. Reconnect the washer hose (2) to the barbed outlet nipple of the washer pump (7).
4. Reconnect the headlamp and dash wire harness (1) connector for the washer pump/motor unit (5) to the connector receptacle on the top of the pump motor.
5. Reconnect the headlamp and dash wire harness connector for the washer fluid level switch (6) to the connector receptacle for the switch (3).
6. Reconnect the negative cable to the battery. If equipped with an Intelligent Battery Sensor (IBS), reconnect the IBS connector.
7. Refill the washer reservoir with the washer fluid drained from the reservoir during the removal procedure.

SWITCH, WASHER FLUID LEVEL

DESCRIPTION

DESCRIPTION



[**Fig. 45: Washer Fluid Level Switch**]()
Courtesy of CHRYSLER GROUP, LLC

The washer fluid level switch (3) is a two-pin conductivity sensor with no moving parts mounted on the outboard facing side of the washer reservoir on the right frame rail, ahead of the left front wheel opening. Only the molded plastic switch mounting flange and the integral connector receptacle (4) are visible when the switch is installed in the reservoir.

A short nipple formation (1) extends from the inner surface of the switch mounting flange, and a barb on the nipple is pressed through a rubber grommet seal installed in the mounting hole of the reservoir. Two over-molded pins or electrodes (2) extend from the back of the nipple formation. The switch is connected to the vehicle electrical system through a dedicated take out and connector of the headlamp and dash wire harness.

The washer fluid level switch cannot be adjusted or repaired. If ineffective or damaged, the switch must be replaced.

OPERATION

OPERATION

The washer fluid level switch uses fluid conductivity to monitor the level of the washer fluid in the washer reservoir. Electricity is conducted between the two switch pins or electrodes only when they are immersed in the washer fluid, which closes the switch circuit. When the fluid level in the washer reservoir falls below the pins, electrical current cannot be conducted and the switch becomes an open circuit, which signals a low fluid condition.

In order to prevent an electrical charge from accumulating in the electrical leads of the switch, the switch receives current that is pulsed from the Body Control Module (BCM) (also known as the Common Body Controller/CBC) located in the passenger compartment. The BCM monitors the switch return signal and is programmed to respond to three consecutive open switch readings by sending an electronic **washer fluid indicator lamp-ON request** message to the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) over the Controller Area Network (CAN) data bus. The IC responds to this message by illuminating the washer fluid indicator and by sounding an audible chime tone warning.

The washer fluid level switch is connected to the vehicle electrical system through a dedicated take out and connector of the headlamp and dash wire harness. The switch is connected in series between a sensor return circuit and the washer fluid switch sense input to the BCM.

The washer fluid level switch and the hard wired circuits between the switch and the BCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the washer fluid level indicator or the electronic controls and communication between other modules and devices that provide some features of the washer system. The most reliable, efficient and accurate means to diagnose the washer fluid level indicator or the electronic controls and communication related to washer fluid level switch operation requires the use of a diagnostic scan tool. Refer to the appropriate Diagnostic & Testing article.

REMOVAL

REMOVAL

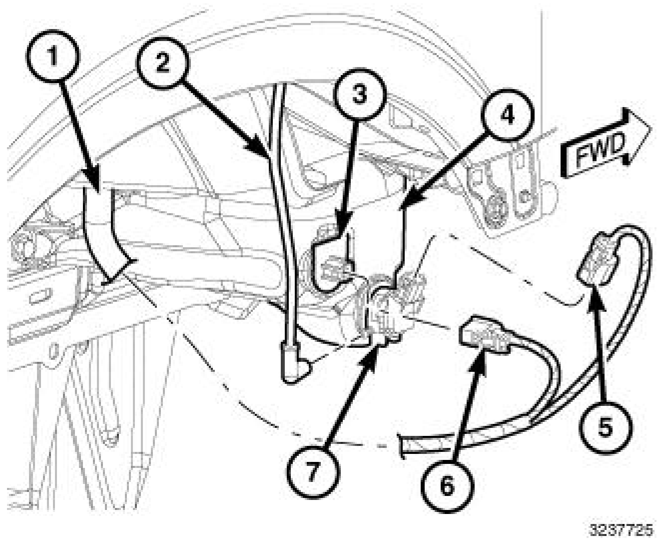


Fig. 46: Washer Pump/Motor Unit, Washer Reservoir, Dash Wire Harness, Pump Motor & Washer Hose
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The washer fluid level switch may be removed from the washer reservoir without removing the reservoir from the vehicle.**

1. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery.
2. Turn the steering wheel to move the front wheels to the full right turn position.
3. Raise and support the vehicle.
4. Remove the fasteners that secure the forward end of the right front wheel house splash shield to the inner fender panel and the front fascia. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** .
5. Pull the forward end of the splash shield away from the inner fender panel and front fascia far enough to access the washer fluid level switch (3) on the washer reservoir (4) on the outboard side of the right frame rail.
6. Disconnect the headlamp and dash wire harness (1) connector for the washer fluid level switch (6) from

the switch connector receptacle.

7. Disconnect the washer hose (2) from the barbed outlet nipple of the washer pump and allow the washer fluid to drain into a clean container for reuse.
8. Using hand pressure, firmly grasp and pull the washer fluid level switch outward far enough to disengage the barbed switch nipple from the rubber grommet seal in the reservoir. Care must be taken not to damage the reservoir.
9. Remove the washer fluid level switch from the washer reservoir.
10. Remove the rubber grommet seal from the washer fluid level switch mounting hole in the reservoir and discard.

INSTALLATION

INSTALLATION

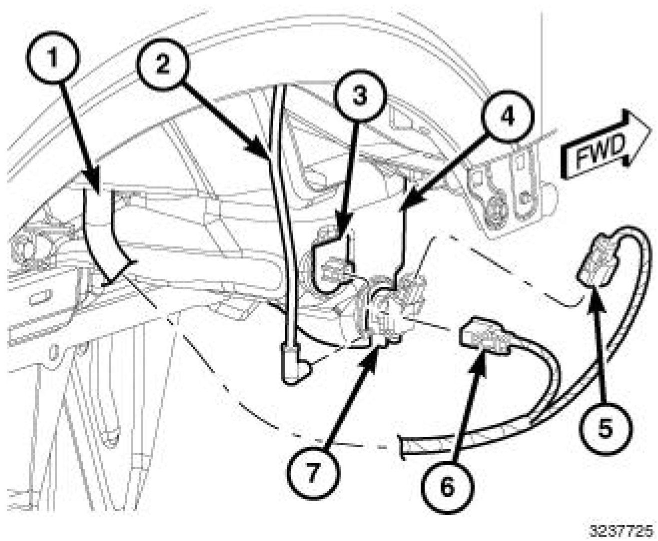

Fig. 47: Washer Pump/Motor Unit, Washer Reservoir, Dash Wire Harness, Pump Motor & Washer Hose
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The washer fluid level switch may be removed from the washer reservoir without removing the reservoir from the vehicle.**

1. Lubricate a new rubber grommet seal with clean washer fluid and install it into the washer fluid level switch mounting hole in the washer reservoir (4). Always use a new rubber grommet seal on the reservoir.
2. Position the barbed nipple of the of the washer fluid level switch (3) to the rubber grommet seal in the reservoir.
3. Using hand pressure, press firmly and evenly on the washer fluid level switch until the barbed nipple is fully seated in the rubber grommet seal in the switch mounting hole of the reservoir.
4. Reconnect the washer hose (2) to the barbed outlet nipple of the washer pump.
5. Reconnect the headlamp and dash wire harness (1) connector for the washer fluid level switch (6) to the connector receptacle for the switch.
6. Reinstall the fasteners that secure the right front wheel house splash shield to the inner fender panel and the front fascia. Refer to SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION .
7. Lower the vehicle.

8. Reconnect the negative cable to the battery. If equipped with an Intelligent Battery Sensor (IBS), reconnect the IBS connector.
9. Refill the washer reservoir with the washer fluid drained from the reservoir during the removal procedure.
